Summary of the Protocols, and Final Act, of the International Marine Conference held at Washington, October to December 1889.

The British Delegates to International Marine Conference to the Marquis of Salisbury.—(*Received January* 13, 1890.)

(Extract.) *Washington, December* 31, 1889.

WE have the honour to inform your Lordship that the Conference terminated its labours to-day.

We beg to inclose herewith a Summary of the Protocols of the Conference, which we have prepared for convenience of reference.

We have also the honour to inclose copies of the Resolutions passed by the Conference, based on the recommendations of these Committees.

We have, &c.

Inclosure 1.

Summary of Proceedings.

October 17, 1889.

IT was resolved that the Articles of the Revised Regulations for Preventing Collisions at Sea, and known as the International Rules, be considered Article by Article in numerical order.

The Rules were accordingly read, and various amendments were proposed which were printed for consideration.

The Rules are appended.

REGULATIONS FOR PREVENTING COLLISIONS AT SEA.

Article 1. In the following Rules every steam-ship which is under sail and not under steam is to be considered a sailing-ship; and every steam-ship which is under steam, whether under sail or not, is to be considered a ship under steam.

Rules concerning Lights.

Art. 2. The lights mentioned in the following Articles, numbered 3, 4, 5, 6, 7, 8, 9, 10, and 11, and no others, shall be carried in all weathers, from sunset to sunrise.

Art. 3. A sea-going steam-ship when under way shall carry—

(*a.*) On or in front of the foremast, at a height above the hull of not less than 20 feet, and if the breadth of the ship exceeds 20 feet, then at a height above the hull not less than such breadth, a bright white light, so constructed as to show an uniform and unbroken light over an arc of the horizon of 20 points of the compass, so fixed as to throw the

light 10 points on each side of the ship, viz., from right ahead to two points abaft the beam on either side, and of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 5 miles.

(*b.*) On the starboard side, a green light, so constructed as to show an uniform and unbroken light over an arc of the horizon of 10 points of the compass, so fixed as to throw the light from right ahead to 2 points abaft the beam on the starboard side, and of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 2 miles.

(*c.*) On the port side, a red light, so constructed as to show an uniform and unbroken light over an arc of the horizon of 10 points of the compass, so fixed as to throw the light from right ahead to 2 points abaft the beam on the port side, and of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 2 miles.

(*d.*) The said green and red side lights shall be fitted with inboard screens projecting at least 3 feet forward from the light, so as to prevent these lights from being seen across the bow.

Art. 4. A steam-ship, when towing another ship, shall, in addition to her side lights, carry two bright white lights in a vertical line one over the other, not less than 3 feet apart, so as to distinguish her from other steam-ships. Each of these lights shall be of the same construction and character, and shall be carried in the same position, as the white light which other steam-ships are required to carry.

Art. 5. (*a.*) A ship, whether a steam-ship or a sailing-ship, which from any accident is not under command, shall at night carry, in the same position as the white light which steam-ships are required to carry, and, if a steam-ship, in place of that light, three red lights in globular lanterns, each not less than 10 inches in diameter, in a vertical line one over the other, not less than 3 feet apart, and of such a character as to be visible on a dark night with a clear atmosphere at a distance of at least 2 miles; and shall by day carry in a vertical line one over the other, not less than 3 feet apart, in front of but not lower than her foremast head, three black balls or shapes, each 2 feet in diameter.

(*b.*) A ship, whether a steam-ship or a sailing-ship, employed in laying or in picking up a telegraph cable, shall at night carry in the same position as the white light which steam-ships are required to carry, and, if a steam-ship, in place of that light, three lights in globular lanterns each not less than 10 inches in diameter, in a vertical line over one another, not less than 6 feet apart; the highest and lowest of these lights shall be red, and the middle light shall be white, and they shall be of such a character that the red lights shall be visible at the same distance as the white light. By day she shall carry in a vertical line one over the other not less than 6 feet apart, in front of but not lower than her foremast head, three shapes not less than 2 feet in diameter, of which the top and bottom shall be globular in shape and red in colour, and the middle one diamond in shape and white.

(*c.*) The ships referred to in this Article, when not making any way through the water, shall not carry the side lights, but when making way shall carry them.

(*d.*) The lights and shapes required to be shown by this Article are to be taken by other ships as signals that the ship showing them is not under command, and cannot therefore get out of the way. The signals to be made by ships in distress and requiring assistance are contained in Article 27.

Art. 6. A sailing-ship under way, or being towed, shall carry the same lights as are provided by Article 3 for a steam-ship under way, with the exception of the white light, which she shall never carry.

Art. 7. Whenever, as in the case of small vessels during bad weather, the green and red side lights cannot be fixed, these lights shall be kept on deck, on their respective sides of the vessel, ready for use; and shall, on the approach of or to other vessels, be exhibited on their respective sides in sufficient time to prevent collision, in such manner as to make them most visible, and so that the green light shall not be seen on the port side nor the red light on the starboard side.

To make the use of these portable lights more certain and easy, the lanterns containing them shall each be painted outside with the colour of the light they respectively contain, and shall be provided with proper screens.

Art. 8. A ship, whether a steam-ship or a sailing-ship, when at anchor, shall carry, where it can best be seen, but at a height not exceeding 20 feet above the hull, a white light, in a globular lantern of not less than 8 inches in diameter, and so constructed as to show a clear uniform and unbroken light visible all round the horizon, at a distance of at least 1 mile.

Art. 9. A pilot-vessel, when engaged on her station on pilotage duty, shall not carry the lights required for other vessels, but shall carry a white light at the masthead, visible

all round the horizon, and shall also exhibit a flare-up light or flare-up lights at short intervals, which shall never exceed fifteen minutes.

A pilot-vessel, when not engaged on her station on pilotage duty, shall carry lights similar to those of other ships.

Art. 10. Open boats and fishing-vessels of less than 20 tons net registered tonnage, when under way and when not having their nets, trawls, dredges, or lines in the water, shall not be obliged to carry the coloured side lights; but every such boat and vessel shall in lieu thereof have ready at hand a lantern with a green glass on the one side and a red glass on the other side, and on approaching to or being approached by another vessel such lantern shall be exhibited in sufficient time to prevent collision, so that the green light shall not be seen on the port side nor the red light on the starboard side.

The following portion of this Article applies only to fishing-vessels and boats when in the sea off the coast of Europe lying north of Cape Finisterre: —

(*a.*) All fishing-vessels and fishing-boats of 20 tons net registered tonnage, or upwards, when under way and when not required by the following Regulations in this Article to carry and show the lights therein named, shall carry and show the same lights as other vessels under way.

(*b.*) All vessels when engaged in fishing with drift-nets shall exhibit two white lights from any part of the vessel where they can be best seen. Such lights shall be placed so that the vertical distance between them shall be not less than 6 feet and not more than 10 feet; and so that the horizontal distance between them measured in a line with the keel of the vessel shall be not less than 5 feet and not more than 10 feet. The lower of these two lights shall be the more forward, and both of them shall be of such a character, and contained in lanterns of such construction, as to show all round the horizon, on a dark night with a clear atmosphere, for a distance of not less than 3 miles.

(*c.*) A vessel employed in line-fishing with her lines out shall carry the same lights as a vessel when engaged in fishing with drift-nets.

(*d.*) If a vessel when fishing becomes stationary in consequence of her gear getting fast to a rock or other obstruction, she shall show the light and make the fog-signal for a vessel at anchor.

(*e.*) Fishing-vessels and open boats may at any time use a flare-up in addition to the lights which they are by this Article required to carry and show. All flare-up lights exhibited by a vessel when trawling, dredging, or fishing with any kind of drag-net shall be shown at the after part of the vessel, excepting that, if the vessel is hanging by the stern to her trawl, dredge, or drag-net, they shall be exhibited from the bow.

(*f.*) Every fishing-vessel and every open boat when at anchor between sunset and sunrise shall exhibit a white light visible all round the horizon at a distance of at least 1 mile.

(*g.*) In fog, mist, or falling snow, a drift-net vessel attached to her nets, and a vessel when trawling, dredging, or fishing with any kind of drag-net, and a vessel employed in line-fishing with their lines out, shall at intervals of not more than two minutes make a blast with her fog-horn and ring her bell alternately.

Art. 11. A ship which is being overtaken by another shall show from her stern to such last-mentioned ship a white light or a flare-up light.

Sound Signals for Fog, &c.

Art. 12. A steam-ship shall be provided with a steam-whistle or other efficient steam-sound signal, so placed that the sound may not be intercepted by any obstructions, and with an efficient fog-horn to be sounded by a bellows or other mechanical means, and also with an efficient bell.* A sailing-ship shall be provided with a similar fog-horn and bell.

In fog, mist, or falling snow, whether by day or night, the signals described in this Article shall be used as follows; that is to say:—

(*a.*) A steam-ship under way shall make with her steam-whistle, or other steam-sound signal, at intervals of not more than two minutes, a prolonged blast.

(*b.*) A sailing-ship under way shall make with her fog-horn, at intervals of not more than two minutes, when on the starboard tack one blast, when on the port tack two blasts in succession, and when with the wind abaft the beam three blasts in succession.

(*c.*) A steam-ship and a sailing-ship, when not under way, shall at intervals of not more than two minutes ring the bell.

* In all cases where the Regulations require a bell to be used a drum will be substituted on board Turkish vessels.

Speed of Ships to be moderate in Fog, &c.

Art. 13. Every ship, whether a sailing-ship or a steam-ship, shall, in a fog, mist, or falling snow, go at a moderate speed.

Steering and Sailing Rules.

Art. 14. When two sailing-ships are approaching one another, so as to involve risk of collision, one of them shall keep out of the way of the other, as follows, viz. :—

(*a.*) A ship which is running free shall keep out of the way of a ship which is close-hauled.

(*b.*) A ship which is close-hauled on the port tack shall keep out of the way of a ship which is close-hauled on the starboard tack.

(*c.*) When both are running free with the wind on different sides, the ship which has the wind on the port side shall keep out of the way of the other.

(*d.*) When both are running free with the wind on the same side, the ship which is to windward shall keep out of the way of the ship which is to leeward.

(*e.*) A ship which has the wind aft shall keep out of the way of the other ship.

Art. 15. If two ships under steam are meeting end on, or nearly end on, so as to involve risk of collision, each shall alter her course to starboard, so that each may pass on the port side of the other.

This Article only applies to cases where ships are meeting end on, or nearly end on, in in such a manner as to involve risk of collision, and does not apply to two ships which must, if both keep on their respective courses, pass clear of each other.

The only cases to which it does apply are, when each of the two ships is end on, or nearly end on, to the other; in other words, to cases in which, by day, each ship sees the masts of the other in a line, or nearly in a line, with her own; and by night, to cases in which each ship is in such a position as to see both the side lights of the other.

It does not apply, by day, to cases in which a ship sees another ahead, crossing her own course; or by night, to cases where the red light of one ship is opposed to the red light of the other, or where the green light of one ship is opposed to the green light of the other, or where a red light without a green light, or a green light without a red light, is seen ahead, or where both green and red lights are seen anywhere but ahead.

Art. 16. If two ships under steam are crossing, so as to involve risk of collision, the ship which has the other on her own starboard side shall keep out of the way of the other.

Art. 17. If two ships, one of which is a sailing-ship, and the other a steam-ship, are proceeding in such directions as to involve risk of collision, the steam-ship shall keep out of the way of the sailing-ship.

Art. 18. Every steam-ship when approaching another ship so as to involve risk of collision shall slacken her speed, or stop and reverse, if necessary.

Art. 19. In taking any course authorized or required by these Regulations, a steam-ship under way may indicate that course to any other ship which she has in sight by the following signals on her steam-whistle, viz. :—

One short blast to mean "I am directing my course to starboard."

Two short blasts to mean "I am directing my course to port."

Three short blasts to mean "I am going full speed astern."

The use of these signals is optional, but if they are used the course of the ship must be in accordance with the signal made.

Art. 20. Notwithstanding anything contained in any preceding Article, every ship, whether a sailing-ship or a steam-ship, overtaking any other, shall keep out of the way of the overtaken ship.

Art. 21. In narrow channels every steam-ship shall, when it is safe and practicable, keep to that side of the fairway or mid-channel which lies on the starboard side of such ship.

Art. 22. Where by the above Rules one of two ships is to keep out of the way, the other shall keep her course.

Art. 23. In obeying and construing these Rules, due regard shall be had to all dangers of navigation, and to any special circumstances which may render a departure from the above Rules necessary in order to avoid immediate danger.

No Ship, under any circumstances, to neglect proper Precautions.

Art. 24. Nothing in these Rules shall exonerate any ship, or the owner, or master, or crew thereof, from the consequences of any neglect to carry lights or signals, or o

any neglect to keep a proper look-out, or of the neglect of any precaution which may be required by the ordinary practice of seamen, or by the special circumstances of the case.

Reservation of Rules for Harbours and Inland Navigation.

Art. 25. Nothing in these Rules shall interfere with the operation of a special Rule, duly made by local authority, relative to the navigation of any harbour, river, or inland navigation.

Special Lights for Squadrons and Convoys.

Art. 26. Nothing in these Rules shall interfere with the operation of any special Rules made by the Government of any nation with respect to additional station and signal lights for two or more ships of war or for ships sailing under convoy.

Art. 27. When a ship is in distress and requires assistance from other ships or from the shore, the following shall be the signals to be used or displayed by her, either together or separately; that is to say—

In the daytime—

1. A gun fired at intervals of about a minute;
2. The International Code signal of distress indicated by N C;
3. The distant signal, consisting of a square flag, having either above or below it a ball or anything resembling a ball.

At night—

1. A gun fired at intervals of about a minute;
2. Flames on the ship (as from a burning tar barrel, oil barrel, &c.);
3. Rockets or shells, throwing stars of any colour or description, fired one at a time, at short intervals.

October 21 *and* 22.

Further amendments were proposed and printed for consideration.

October 28.

Article 1.—*Mr. Goodrich* (United States) proposed to substitute the word "vessel" for "ship"; the word "vessel" being a generic term.

Mr. Hall (Great Britain) proposed that a steam-vessel being towed should be treated as a sailing-vessel.

The first amendment was adopted, the second postponed.

Mr. Hall (Great Britain) proposed to add to Article 1 the words, "Steam-vessels shall include all vessels propelled by machinery," so as to include modern vessels propelled by a motive power other than steam.

A discussion arose on the wording, and it was decided to put the amendment in principle, leaving the actual wording to a later stage. In this form it was carried.

Article 2.—*Captain Mensing* (Germany) proposed that Article 2 be amended by the addition of the words, "and no others which might be mistaken for such lights," in order to avoid the danger of misleading lights, while recognizing the faat that other lights may be carried on board ship.

This amendment was accepted by the British Delegates, who preferred it to a somewhat similar amendment proposed by Captain Salvesen (Norway) as involving less change in the wording, and carried unanimously.

Mr. Hall (Great Britain) proposed an addition to the Rule to the effect that in cases where the breadth of the ship is over 40 feet the light need not be carried at a greater height above the water than 40 feet.

Some discussion arose owing to a Delegate of the United States stating that the Rule would change the system existing in the harbour and waters of New York. It was, however, pointed out that he was under a misapprehension, and the amendment was carried as proposed.

Article 3.—*Mr. Goodrich* (United States) proposed that the first line be amended as follows, "Every steam-vessel when under way," omitting the word "sea-going" in order that the Rules might be made to apply to all waters alike, the several nations to make their own exceptions as to their own waters.

Mr. Hall (Great Britain) said that, so far as he was aware, the word had no reference to jurisdiction, but that its object was to classify vessels in a general way, sea-going vessels being presumably large enough to carry the lights provided for vessels which navigated the sea.

A clause would have to be inserted excluding vessels too small to carry such lights.

It was pointed out that the word was omitted in the Rules of Austria, Denmark, Germany, Italy, Mexico, Norway, and Sweden.

Dr. Sieveking (Germany) said that the word was omitted in the German Rules because there were no local Rules on the German rivers.

The motion was carried.

November 1.

Extra amendments were proposed.

November 4.

Article 3.—*Captain Mensing* (Germany) proposed: "That a certain candle power be substituted as the standard for the visibility of lights mentioned in these Rules in lieu of the standard now in force."

After discussion, the following amendment was proposed: "That a certain candle power be adopted as a standard for the visibility of light mentioned in these Rules, the candle power to be hereafter determined."

It was agreed that this should be recorded in the shape of a note to the Rules, and it was accepted upon these terms by the *Delegates of Great Britain*, and carried by the Conference.

Mr. Verney (Siam) proposed that the word "uniform" before "unbroken light" be struck out, on the grounds that the light could not be made uniform.

The amendment was accepted by *Mr. Hall* (Great Britain), and carried.

Article 4.—Amendment proposed by *Mr. Hall* (Great Britain), that the distance between the lights be 6 feet instead of 3 feet.

The United States' Delegates proposed that the distance be 4 feet.

The former amendment was carried.

Captain Shackford (United States) proposed an amendment to the effect that a vessel towing shall carry a small bright light abaft the funnel for the vessel being towed to steer by.

Mr. Hall suggested that the Rule should be made permissive.

It was put in the following form:—

"A small bright light abaft the funnel or after mast may be carried for the vessel being towed to steer by, such light to be only visible from right astern to four points on each quarter."

It was opposed by *Captain Richard* (France), and put to the vote.

The Delegates of France, Norway, Sweden, and *the Netherlands* voted against it; and it was carried by 15 to 4.

November 5.

Mr. Shackford proposed a change in his amendment as to lights on vessels towing, viz., "not to be visible before the beam," instead of "to be visible from right astern to four points abaft the beam."

Mr. Hall (Great Britain) supported the change on the ground of simplicity; and it was carried.

Captain Malmberg (Sweden) proposed that a sailing-vessel towing another vessel should carry the same lights as a vessel not under command.

After some discussion, during which *Mr. Hall* (Great Britain) stated that he had no objection to giving such a ship a distinctive light, provided such a light could be found, the amendment was carried in a modified form as follows:—

"A sailing-vessel towing a disabled vessel shall carry some distinctive light, provided such light can be determined upon by the Conference."

Mr. Hall (Great Britain) proposed an amendment to Article 5 to add the words, "These signals are not signals of ships in distress and requiring assistance. Such signals are contained in Article 27;" a change of verbiage in order to make the Article plainer.

The amendment was carried.

Article 5.—*M. van Steyn* (Netherlands) proposed an amendment:—

"A ship, whether a steam-ship or a sailing-ship, which from any accident is not under command, shall at night carry in the same position as the white lights which steam-ships are required to carry, and if a steam-ship, in place of that light, three red lights in globular lanterns not less than 6 feet apart, and of such a character as to be visible on a dark night, in a clear atmosphere, at a distance of at least 2 miles, and shall by day," &c.

Mr. Hall (Great Britain) stated that he intended to propose two lights and two balls instead of three, but that it would not affect the principle of the amendment.

The amendment was carried.

M. van Steyn (Netherlands) proposed an amendment:—

"(*b.*) A ship, whether a steam-ship or a sailing-ship, employed in laying or in picking up a telegraph cable, shall at night carry, in the same position as the white light which steam-ships are required to carry, and if a steam-ship, in place of that light, three lights in globular lanterns in a vertical line over one another, not less than 6 feet apart. The highest and lowest of these lights shall be red, and the middle light shall be white, and they shall be of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 2 miles. By day she shall carry, in a vertical line, one over the other, not less than 6 feet apart, where they can best be seen, three shapes not less than 2 feet in diameter, of which the top and bottom shall be globular in shape and red in colour, and the middle one diamond in shape and white."

Captain Mensing (Germany) proposed an amendment to strike out the words "in globular lanterns," and add, after the words, "at a distance of at least 2 miles," the following: "but if she be a steam-ship, then at a distance of not less than 5 miles.

Captain Mensing's amendment was lost.

Mr. Hall (Great Britain) pointed out the difficulty of getting a coloured light to show more than 2 miles, and *Captain Malmberg* (Sweden) stated that ordinary ships were used in Sweden to lay telegraph cables, which could not carry very powerful lights.

The original amendment was carried.

Captain van Steyn (Netherlands) proposed to add, as a recommendation to the Conference, that a special signal should be found for steamers in the daytime which were proceeding under sail only, but which were manageable.

Mr. Hall (Great Britain) said that he had no objection in principle to the proposal, the object of which was to show at once that a vessel which was apparently a steamer was not one, but a sailing-vessel.

The principle was adopted, and referred to the Collocation Committee.

Mr. Hall (Great Britain) proposed:—

"Art. 5. (*a.*) A ship, whether a steam-ship or a sailing-ship, which from any accident is not under command, shall at night carry, in the same position as the white light which steam-ships are required to carry, and if a steam-ship, in place of that light, two red lights in globular lanterns, each not less than 10 inches in diameter, in a vertical line, one over the other, not less than 6 feet apart, and of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 2 miles, and shall by day carry, in a vertical line, one over the other, not less than 6 feet apart, in front of but not lower than her foremast-head, two black balls or shapes, each 2 feet in diameter;" on the grounds that two red lights were sufficient.

The amendment was carried.

Dr. Sieveking (Germany) proposed that a vessel aground in a fairway should carry the lights for vessels not under command.

Mr. Hall (Great Britain) stated that it had been argued in the English Courts that vessels aground in a fairway should carry such lights, and not those for a vessel at anchor.

Mr. Goodrich (United States) and *Captain Richard* (France) opposed the amendment, which was negatived by 15 to 5, Great Britain, Germany, Denmark, Russia, Sweden, and Siam voting for it.

[*Note.*—This was subsequently carried. See November 11, *infra.*]

November 7.

Article 6.—*Mr. Hall* (Great Britain) proposed an amendment:—

"Art. 6. A sailing-ship under way or being towed shall carry the same lights as are provided by Article 3 for a steam-ship under way, with the exception of the white light, which she shall never carry;" which was carried.

M. Richard (France) proposed an amendment to the effect that sailing-vessels should carry the same lights as steam-vessels, with a white mast-head light in addition.

He explained, however, that out of deference to his colleagues on the Committee of Lights, who had decided against his proposal, he would now withdraw it.

Mr. Hall (Great Britain) proposed:—

"Art. 8. A ship under 100 feet in length, whether a steam-ship or a sailing-ship, when at anchor, shall carry forward, where it can best be seen, but at a height not exceeding 20 feet above the hull, a white light, in a globular lantern of not less than 8 inches in diameter, and so constructed as to show a clear, uniform, and unbroken light visible all round the horizon, at a distance of at least 1 mile.

"All ships of 100 feet or upwards in length, when at anchor, shall carry two such lights as follows, that is to say:—

"In the forward part of the ship, and at a height of not less than 20 and not exceeding 40 feet above the hull, one such light; and at or near the stern of the ship, and at such a height that it shall be not less than 15 feet lower than the forward light, the other of such lights.

"The length of a ship shall be deemed to be the length appearing in her certificate of registry."

Mr. Hall explained that in his amendment he had inserted the word "forward" after "carry" in the second line, in adoption of an amendment of the German Delegates.

Dr. Sieveking (Germany) proposed to put the limit at 150 feet instead of 100 feet, which he thought was too low.

Mr. Hall accepted the alteration.

Captain Shackford (United States) proposed as an amendmend that a distinctive second riding light, consisting of a red and a white light 30 inches apart, should be carried at the stern. This Resolution was put to the Conference and lost; and the original amendment as proposed by Mr. Hall was carried, with the change of 100 to 150 feet.

Article 11.—An amendment to Article 11 was moved by the Delegates from the Netherlands to the effect that every vessel exceeding 20 tons registered should carry on her stern an irregularly occulting white light.

Mr. Hall (Great Britain) moved that before this amendment was put to the vote the proposal made by the British Delegates should be considered, viz.:—

"Art. 11. A ship which is being overtaken by another shall show from her stern to such last-mentioned ship a white light or a flare-up light.

"The white light required to be shown by this Article may be fixed, and carried in a lantern, but in such case the lantern shall be so constructed, fitted, and screened that it shall throw an uniform and unbroken light over an arc of 12 points, that is to say, for 6 points from right aft on each side of the ship.

"Such lights shall be carried as nearly as practicable on the same level as the side lights."

Mr. Goodrich (United States) proposed that the words "or occulting" should be added after the word "fixed."

Mr. Hall pointed out that the Conference was thus asked to sanction the use of a light as to which they had no data and no precise information, and upon which no public experiments had been made.

Mr. Goodrich's amendment was put and lost; and the British proposal was adopted with two alterations, viz.: (1) the words "uniform and" were struck out in conformity with a previous vote of the Conference. (See *supra*, November 4.)

2. The words, "and so as to be visible on a dark night, in a clear atmosphere, at a distance of 1 mile," were added after the word "ship." Both alterations were accepted by the British Delegates; the limit of 1 mile being adopted with a view to induce small vessels to adopt the light.

The British Delegates then moved an Additional Article, as follows:—

"*Lights and Signals to Attract Attention.*

"Art. .—Every ship may at any time, in addition to the lights which she is by these Regulations required to carry, show a flare-up light or use a detonating signal to attract attention."

Some discussion arose upon this. It was pointed out that confusion with distress signals might be entailed; and *Mr. Hall*, acknowledging that the criticisms were worthy of consideration, asked that the Conference should vote on the principle, leaving it to subsequent discussion as to what kind of signals should be used.

At the suggestion of *M. Flood* (Norway), the words "when necessary" were substituted for "at any time."

The question upon the principle was carried.

[*Note.*—The signals suggested above were adopted, see December 5, *infra*.]

November 8.

Article 12.—*Mr. Hall* (Great Britain) proposed:—

"In fog, mist, or falling snow, whether by day or night, the signals described in this Article shall be used as follows, that is to say:—

"(*a.*) A steam-ship under way shall make with her steam whistle, or other steam

sound-signal, at intervals of not more than two minutes, a long blast of about four seconds duration.

"(*b.*) A steam-ship not at anchor, but stopped and having no way upon her, shall sound, at intervals of not more than two minutes, two * long blasts with an interval of about one second between them.

"(*c.*) A sailing-ship under way shall make with her fog-horn, at intervals of not more than ~~two minutes,~~† when on the starboard tack one blast, when on the port tack two blasts in succession, and when with the wind abaft the beam three blasts in succession.

"(*d.*) A steam-ship and a sailing-ship, when at anchor, ~~or moored,~~‡ shall, at intervals of not more than ~~two minutes,~~† ring the bell.§"

On the amendment to section (*a*) a discussion arose.

Captain Shackford (United States) said that the experience of seamen was in favour of a blast of at least six seconds duration, an assertion which was controverted by *Captain Mensing* (Germany).

Captain Wyatt (Great Britain) stated that he had several times had his hearing seriously affected by the continuous sound of the whistle.

The amendment to section (*a*) was carried.

Mr. Hall (Great Britain) then moved his amendment to section (*b*), inserting the word "such" between "two" and "blasts." It was carried.

In subsection (*c*) *Mr. Goodrich* (United States) moved an amendment changing the words "two minutes" to "one minute," which was carried.

In subsection (*d*) the words "or moored" were omitted by general consent, as, by a ruling of the Conference on the 7th November, there was no doubt about the meaning of the words "at anchor."

On the proposal of *Mr. Goodrich* (United States), to which the British Delegates assented, the latter part of the paragraph was amended to read, "shall at intervals of not more than one minute ring the bell rapidly for about five seconds."

Captain Mensing (Germany) proposed that the words, "to be sounded by a bellows or other mechanical means," in the first paragraph, should be omitted. This was opposed by *Mr. Hall* (Great Britain), and the amendment was lost.

Captain Malmberg (Sweden) moved that a vessel towing should sound a distinctive signal.

At *Mr. Hall's* suggestion, the amendment was carried in principle, and referred to the Committee on Sound Signals, who should also report whether or no it was desirable to have a distinctive signal for a sailing-ship towing.

A discussion arose as to the meaning of the words "at anchor," which *Mr. Goodrich* (United States) desired should be defined by the Collocation Committee, but his proposal was lost.

M. Verbrugghe (Belgium) raised the question as to a standard for fog-signals.

At the instance of *Mr. Hall* (Great Britain), it was moved that it was desirable that there should be a common standard as to the minimum distance at which such signals should be heard in ordinary weather, in order to call the attention of the Powers to the subject, and invite experiments.

The motion was carried.

November 11.

Article 6.—*Mr. Hall* (Great Britain) proposed an amendment to Article 1, to the effect that steamers being towed were to be considered sailing-vessels, but he withdrew it in favour of an amendment to Article 6 moved by *Mr. Goodrich* (United States), which was passed.

Article 6, as amended, is as follows:—

"A sailing-ship under way and any vessel being towed shall carry the same lights as are provided by Article 3 for a steam-ship under way, with the exception of the white light mentioned in Article 3 (*a*), which she shall never carry."

Article 5.—A discussion then took place on a motion from *Mr. Goodrich* (United States) in favour of a system of auxiliary side lights, which was unanimously rejected, the *United States' Delegates* voting against his proposal; and on the proposal of *Captain Shackford* (United States) for a white range light to be carried by steamers on the after mast, visible all round the horizon.

It was supported by *Mr. Hall* (Great Britain), in a permissive form, as an experiment which it was advisable to make, and which he understood had been successfully made in the inland waters of the United States; and was carried in the following form:—

* "Such" inserted here. † One minute. ‡ Omitted.
§ Added: "rapidly for about five seconds."

"Art. 3 (*e*). All steamers when under way at night may carry on one of the after masts a white light visible all around the horizon; said light must be at a height of not less than 20 feet above the forward bright light."

Article 12.—*Captain van Steyn* (Netherlands) proposed an amendment to Article 12:—

"A steam-ship shall be provided with a whistle or siren sounded by steam, or other efficient substitute for steam," &c.; to provide for the cases of vessels propelled by electricity.

This amendment was carried.

Mr. Hall (Great Britain) suggested that provision should be made for the use of the gong in Chinese waters, which suggestion was adopted.

Article 8 (*b*).—*Captan Salvesen* (Norway) proposed an amendment as to the lights to be carried by vessels aground in a fairway, which was supported by *Mr. Hall* on the ground that a ship in such a position ought to have a distinctive light.

It was carried in the following form:—

"Art. 8. (*b*). A vessel aground in or near a fairway shall carry, where they can best be seen, two red lights in globular lanterns, one over the other, not less than 6 feet apart, in addition to the above-mentioned anchor light or lights."

Captain Shackford (United States) proposed that Atlantic steamers should use distinctive sound signals to indicate their courses east or west—which proposal he withdrew after some discussion.

Admiral Kaznakoff (Russia) offered some amendments on behalf of the Committee on Lights.

November 12.

Article 13.—The whole question of moderate speed in fog was discussed under an amendment to strike out Article 13.

Dr. Sieveking (Germany) urged that a definition should be given to the term "moderate" for the guidance of Judges and sailors; and proposed the wording, "so far moderate her speed as is consistent with her own safety, and under the circumstances of the case necessary to prevent risk of collision."

Mr. Hall (Great Britain) opposed any change in the Rule on the ground of the impossibility of embracing all possible cases; and that any attempt at precising it might afford an excuse for evading it.

Mr. Goodrich (United States) said that the strength of the law was in its flexibility, and deprecated modification.

The proposal to omit Article 13 was put and lost.

Mr. Goodrich (United States) moved an addition to Article 13, which was supported by *Mr. Hall* (Great Britain) with certain modifications, on the ground that it met the wishes of several of the Delegates as expressed in amendments, and complied with the recommendations of the Sound Signal Committee, besides making law that which practical seamen act upon.

The addition was passed in the following form:—

"A steam-vessel hearing, apparently before her beam, the fog-signal of a vessel the position of which is not ascertained, shall, so far as the circumstances of the case admit, stop her engines, and then proceed with caution until all danger of collision is over."

November 14.

Article 3.—*M. Flood* (Norway) proposed an amendment to the following effect:—

"Art. 3 (*e*). The side lights to be placed in steam-vessels not forward of the mast-head light, and in sailing-vessels as near abreast the foremast as practicable."

He urged this on the ground that it was advisable to define the place where the lights should be placed.

Mr. Hall (Great Britain) opposed the amendment, pointing out that it was practically impossible to assign to the side lights any fixed position with regard to the foremast lights, which would necessitate the alteration, and possibly even reconstruction, of many vessels.

Captain Mensing (Germany) supported the amendment. He said it was in conformity with the Report of the Committee on Lights, and it proposed no hard-and-fast rule, leaving the position of the side lights undefined so long as they were abaft the mast-head light.

The amendment was carried.

The Yeas and Nays were called for, and were as follows:—

Yeas.—Brazil, China, Chile, Denmark, Germany, Norway, Portugal, Russia, Spain, Sweden, the Netherlands, Uruguay.

Nays.—United States, Austria, Belgium, France, Great Britain, Hawaii, Italy, Japan, Mexico.

Note.—See Protocol of the 9th December. The vote was reconsidered and reversed.

Articles 12 and 13.—*M. Flood* (Norway) proposed that the words "heavy rain-storms" should be added, on the ground that there was as much difficulty in seeing during such storms as in falling snow.

The amendment was accepted by *Mr. Hall* (Great Britain), and carried.

The Conference then proceeded to the discussion of the principle of speed.

Dr. Sieveking (Germany) proposed that the wording of the Rule should be, "shall so far moderate her speed as under the circumstances of the case is necessary to prevent a collision."

This, he said, was a necessary definition, as the words of the Article as they stood at present would only imply that the speed must be reduced whether the circumstances required it or not.

Mr. Hall (Great Britain) said that the true meaning of the Rule was perfectly well known to every sailor, and that it was not necessary to modify it.

Mr. Carter (Hawaii) suggested that the addition of the words, "having careful regard to the conditions and circumstances," might reconcile the difference between the two views.

This was accepted by the Delegates from Germany and Great Britain and carried.

A long discussion took place upon an amendment proposed by the Delegates for Germany to the Rule:—

"And when it is safe and practicable and necessary to prevent risk of collision, ships in a fog, mist, or falling snow must lie-to or anchor."

The amendment was put and negatived.

The Conference decided against an amendment to fix the maximum speed to be allowed to ships in fog.

Article 13 was then disposed of.

Steering and Sailing Rules.—*Mr. Hall* (Great Britain) suggested an instruction to sailors in the following words:—

"Risk of collision may, when time permits, be ascertained by carefully watching the compass bearings of an approaching vessel. If the bearings do not appreciably change such risk should be deemed to exist."

This was carried.

November 15.

Article 18.—*Mr. Hall* (Great Britain) proposed that Article 18 be amended so that the holding-on vessel shall keep her course and speed.

The object of the amendment was, he explained, to enable the vessel which has to give way to know what the other ship is going to do, so as to be able to go under her stern if necessary.

Dr. Sieveking (Germany) said that the advantage of the amendment was clear. On the other hand, it increased the difficulties of the position of the holding-on vessel; especially in case the other vessel should be obliged to cross her bow. He wanted to know the opinion of mariners.

Mr. Goodrich (United States) advocated the change as putting an end to the uncertainty which existed in the law at present.

Admiral Molyneux (Great Britain) said that the amendment would remove doubt as to what the action of a ship would be; the holding-on ship is obliged to keep her speed, and the master knows the other ship is not to cross his bow.

Captain Mensing (Germany) said that if it was not an accepted rule that the holding-on ship should keep her speed, the amendment was a necessary one. But he failed to see that there was any necessity for altering the Rule; and argued that there were cases in which the amendment would only lead to embarrassment.

Captain Saldanha de Gama (Brazil), *Commodore Monasterio* (Mexico), *Lieutenant Beaugency* (Chile), and *Captain Richard* (France) spoke in favour of the amendment.

The amendment was put to the Conference and carried.

Mr. Hall (Great Britain) then moved the first part of his amendment to Article 18, which was consequential on the amendment just passed.

The Conference agreed to it in the following form:—

"Every steam-ship which is directed by these Regulations to keep out of the way of another ship shall, on approaching her, if necessary, slacken her speed, or stop or reverse."

Mr. Hall (Great Britain) moved a new Rule, which was carried without discussion, and was as follows :—

"A ship which is required by these Rules to keep out of the way of another ship shall, if the circumstances of the case admit, avoid crossing ahead of the other."

The Conference then considered the proposed Article 22 as drawn up in the London Committee.

Mr. Hall (Great Britain) asked leave to withdraw his proposal, and substitute for it an amendment in the present Article 23, in order to provide for special circumstances where the action of both ships is necessary to avert collision.

Mr. Hall (Great Britain) then moved the new Article 23 of the London Committee, to prevent single ships interfering with squadrons. Consideration was postponed.

November 18.

Article 5.—*Mr. Hall* (Great Britain) moved that the definition of "steam-ship" should be referred to the Collocation Committee, and the question as to the warning signal to be given by any vessel to a vessel approaching, to the Committee on Sound Signals.

Mr. Hall (Great Britain) moved Article 23 of the Rules drawn up by the London Committee as to single ships keeping out of the way of squadrons.

In order to avoid making any provision which it would be difficult for sailing-vessels to comply with (as for instance when hove-to or in a calm), the proposal was amended as follows :—

"In clear weather no vessel shall cross the bows of the leaders of any squadron of ships of war in regular formation, nor pass through the lines of such squadrons; but nothing in this Article shall excuse the ship of war from doing her best to avoid collision."

Consideration was postponed, and the Conference proceeded to the discussion of an amendment to Article 5, already agreed on in principle, which at Mr. Hall's suggestion was modified and carried in the following form :—

"A steam-vessel proceeding under sail and not using her engines shall carry in daytime, in any place of the foretop where it can best be seen, a ball or shape 2 feet in diameter."

Mr. Hall (Great Britain) explained that the object was to provide in daytime against her being mistaken for a ship under steam, owing to the steam escaping from her funnel.

Captain Malmberg (Sweden) proposed a distinctive light for a disabled vessel being towed by a sailing-vessel, but on the difficulty of finding such a light being pointed out to him, he withdrew his amendment.

Article 19.—*Mr. Goodrich* (United States) proposed an amendment to Article 19 (signals for steamers in sight of one another), making them mandatory.

Mr. Hall (Great Britain) spoke in support, on the ground that there was practically a unanimous consensus of opinion among sailors on this point.

Dr. Sieveking (Germany) pointed out the danger likely to arise from mistaking the signals. Moreover, the course to be taken is rigidly laid down by the Rules; the holding-on vessel keeps her course and speed, and it is of no importance to her to know what the other vessel is doing. The advantage of knowing is a moral one merely, and not to be compared to the disadvantage arising from misunderstanding the signals. He also pointed out the legal difficulty caused by the imposition of a new duty on the vessel which is to keep out of the way.

Mr. Goodrich (United States) said it had worked very well in the inland waters of the United States.

Mr. Hall (Great Britain) said the signals were already in constant use at sea. It is a great advantage to the holding-on vessel to know the other vessel sees her. The burden of blowing the whistle is not a very great one.

The amendment was carried.

M. van Steyn (Netherlands) proposed (as already settled in Article 12) to omit the word "steam" in "steam whistle."

The amendment was carried.

Mr. Hall (Great Britain) proposed a definition of the term "short blasts" as a blast of about one second's duration, in order that it should not be confounded with the long blasts prescribed in the Rules.

The amendment was carried.

Article 20.—*Mr. Hall* (Great Britain) proposed the amendment agreed on in the London Committee in order to obviate any doubt as to what "overtaking ship" means.

The amendment was carried.

Article 21.—*M. Flood* (Norway) proposed an amendment to the effect that vessels should reduce their speed in narrow channels.

Mr. Hall (Great Britain) pointed out that it was one of the ordinary precautions seamen were bound to take, and the amendment was withdrawn.

Article 25.—*M. Garde* (Denmark) proposed an addition to the Rule to the effect that the local lights should be additional to the lights used on the high seas, and not be inconsistent with them.

Mr. Hall (Great Britain) and *Dr. Sieveking* (Germany) pointed out that the Sovereign Powers could not be bound as was proposed.

The amendment was withdrawn.

Article 26.—*Captain van Steyn* (Netherlands) proposed an amendment, which at *Mr. Hall's* suggestion was passed in a modified form as follows: to add to Article 26 the words, "or the exhibition of recognition signals adopted by ship-owners, which have been authorized by their respective Governments, duly registered and published to all foreign Governments [provided that the said signals are not so arranged as to cause confusion and mistake]."

Note.—The words in brackets were subsequently struck out in Collocation Committee.

Article 27.—*M. Flood* (Norway) proposed to change the minute gun to a gun fired at short intervals.

The amendment was lost.

Captain van Steyn (Netherlands) proposed an amendment as follows: "a gun or any explosive signal," &c.; which was carried on the understanding that it should be referred to the Committee on Sound Signals.

He also proposed other sound signals which were referred to the same Committee for report.

Preamble.—*Dr. Sieveking* (Germany) proposed a preamble to be inserted before the Rules to the effect that they were applicable to all vessels on the high seas and all navigable waters.

This was referred to the Collocation Committee.

New Article. (*Steamers towing.*)—*Dr. Sieveking* (Germany) proposed a new Article as follows:—

"When a steam-vessel is approaching another vessel which is towing one or more vessels, so as to involve risk of collision, she is to keep out of the way of the vessel towing.

This was opposed by *Mr. Goodrich* (United States), and *Mr. Hall* (Great Britain); and supported by *Captain Biske* (China), and *Captain Malmberg* (Sweden).

The amendment was lost.

November 19.

Mr. Shackford (United States) proposed an amendment with reference to the distance at which sound signals should be heard, which was referred to the Collocation Committee with power to prepare a note to be appended to the Regulations.

M. Verbrugghe (Belgium) proposed an amendment for communication lights, which was referred to the Committee on General Division VIII.

Mr. Hall (Great Britain) brought forward his amendment in regard to ships of war in regular formation (Article 23 of the Rules drawn up in London, as amended), which he said was in the interest of sailing-vessels to prevent their running into danger.

It was opposed by *Captain Richard* (France), as conferring a privilege on war-vessels, and as lacking in precision; and also as likely to give rise to general discontent in cases of collision between vessels of different nationality.

Mr. Goodrich (United States) also opposed it on the ground that the mercantile marine were subordinated to war-vessels.

Captain Sampson (United States), *M. Flood* (Norway), and *Dr. Sieveking* (Germany) supported it; the latter suggesting certain modifications.

The amendment was voted on in the following form:—

"In clear weather, at sea, no vessel shall attempt to cross the bow of the leaders of any squadron of three or more ships of war in regular formation, nor unnecessarily to pass through the line of such squadron."

The words "at sea" were inserted to prevent any doubts in regard to inland waters. The word "unnecessarily" was inserted in deference to the Delegate from Norway. The latter part of the proposed Article was omitted as surplusage.

A division was taken, France, Spain, Sweden, the Netherlands, and the United States voting against, the remainder for.

It was therefore carried.

[*Note.*—This Rule was taken out of the Regulations and submitted as a recommendation to the Powers. See Protocol of December 30.]

Article 4. (*Towing Vessels.*)—*Captain Norcross* (United States) proposed, and *Mr. Hall* (Great Britain) accepted an amendment inserting in Rule 4, after the words "6 feet apart" the words, "and when towing more than one vessel, shall carry an additional bright white light, 6 feet above or below such light."

The amendment was carried.

Article 23. (*Dangers of Navigation.*)—*Mr. Hall* (Great Britain) proposed to insert the words "collision or other" before "danger" (which he said was in lieu of his former proposal: Article 22 of the London Committee). The object of the amendment was to impress on the minds of sailors that they must not hold on too long to the Rule prescribing that the holding-on ship must keep her speed as well as her course.

He said that after consideration the British Delegates had thought it more desirable to give this warning by explaining the general Rule than by having any special Rule.

The amendment was adopted.

Articles 7, 9, and 10.—The Conference proceeded to discuss the Report of the Committee on Lights for Small Craft.

Mr. Goodrich (United States) moved that the amendments proposed by the Committee should be adopted.

Article 7 was then read as amended by the Report:—

"Art. 7. Whenever, as in the case of small vessels under way during bad weather, the green and red side-lights cannot be fixed, these lights shall be kept at hand, ready for use; and shall, on the approach of or to other vessels, be exhibited on their respective sides in sufficient time to prevent collision, in such a manner as to make them most visible, and so that the green light shall not be seen on the port side nor the red light on the starboard side, nor if practicable more than two points abaft the beam on their respective sides.

"To make the use of these portable lights more certain and easy, the lanterns containing them shall each be painted outside with the colour of the light they respectively contain, and shall be provided with proper screens."

The Article was adopted without discussion.

Article 9 (*a*) was then proposed:—

"Art. 9 (*a*). A pilot-vessel, whether under sail or steam, when engaged on her station on pilotage duty, shall not carry the lights required for other vessels, but shall carry a white light at the mast-head, visible all round the horizon, and shall also exhibit a flare-up light or flare-up lights at short intervals, which shall never exceed fifteen minutes.

"When approaching a vessel to put a pilot on board, or when there is risk of collision with another vessel, such pilot-vessel shall have at hand two lights, one red and one green, so constructed that they can be flashed instantaneously, which shall be kept either in their places, screened, or on deck on their respective sides of the vessel, always ready for use, and shall flash one of them (in order to show the direction in which she is heading) in sufficient time to prevent collision, so that the red light shall only be shown on the port side, and the green light only on the starboard side."

M. Flood (Norway) proposed to strike out the words "on her station."

Mr. Goodrich (United States) made some observations suggested by the New Jersey and New York pilots, to the effect that the mast-head light should be carried screened, and only unscreened at certain times, instead of side lights as proposed by the Committee.

Sir G. Nares, on the part of the Committee on Lights for Small Craft, said that as long as the pilot-vessel was stationary or hovering about she should be given the white light; when moving as an ordinary vessel she should carry the side lights.

Mr. Goodrich (United States) proposed an amendment embodying his views, to the effect that the mast-head light and coloured side lights should be carried screened, and unscreened under certain circumstances.

But the original paragraph (*a*) as proposed by the Committee was carried.

Paragraph (*b*) was then proposed.

"(*b.*) A pilot-vessel of such a class as to be obliged to go alongside of a vessel to put a pilot on board may show a white light instead of carrying a white light at the mast-head.

"Such vessels shall also not be obliged to carry the side lights proposed for larger pilot-vessels, but in this case they shall have ready at hand a lantern with a green glass on the one side and a red glass on the other side, and on approaching a vessel to put a pilot on board, or on approaching to or being approached by a vessel, such lantern shall be

exhibited in sufficient time to prevent collision, so that the green light shall not be seen on the port side, nor the red light on the starboard side."

Sir G. Nares (Great Britain) explained that it was proposed to meet the special case of pilot-vessels which had no boats.

Paragraph (*b*) was adopted.

"(*c*). A pilot-vessel, whether under sail or steam, when not engaged on her station on pilotage duty, shall carry lights similar to those of other vessels."

Paragraph (*c*) was adopted.

"Art. 10. Paragraph (*a*) of this Article applies only to boats and vessels propelled by sails or oars, of less than 20 tons gross tonnage, and only to such boats and vessels when they are under way. It therefore applies also to fishing-vessels of less than 20 tons gross tonnage when they are not actually engaged in fishing, but are under way.

"(*a*.) Boats and vessels of less than 20 tons gross tonnage shall not be obliged to carry the coloured side lights; but every such boat and vessel shall, if she do not carry such coloured side lights, have ready at hand a lantern with a green glass on the one side, and a red glass on the other side, and on approaching to or being approached by another vessel such lantern shall be exhibited in sufficient time to prevent collision, so that the green light shall not be seen on the port side nor the red light on the starboard side."

The proposed Rule was adopted without discussion.

Article 10.—"*Note.* Paragraph (*b*) of this Article applies only to vessels under steam of less than 40 tons gross tonnage, and only to such vessels when they are under way. It therefore applies also to fishing-vessels under steam of less than 40 tons gross tonnage when they are not actually engaged in fishing, but are under way.

"(*b*.) A vessel of less than 40 tons gross tonnage when under steam shall not be obliged to carry the lights prescribed for other vessels under steam, but if she does not carry such lights she shall carry on or in front of her foremast, or on or in front of her funnel, or somewhere in the fore part of the vessel where it can best be seen, and at a height above the gunwale of not less than 9 feet, a bright white light visible for at least 2 miles, so constructed as to show over an arc of the horizon of twenty points of the compass, so fixed as to throw the light ten points on each side of the vessel, namely, from right ahead to two points abaft the beam on either side; and such vessel shall further carry either (1) side lights visible for at least 1 mile, or (2) a lantern with a green glass on the one side, and a red glass the other, so constructed that it will show an unbroken green light over an arc of the horizon of ten points of the compass from right ahead to two points abaft the beam on the starboard side, and an unbroken red light over an arc of the horizon of ten points of the compass from right ahead to two points abaft the beam on the port side. This lantern shall be carried at not less than 3 feet below the white light before mentioned."

The proposal was adopted without discussion.

"Art. .—(*a*.) All fishing-vessels and fishing-boats of 20 tons gross tonnage, or upwards, when under way and when not required by the following Regulations in this Article to carry and show the lights therein named, shall carry and show the same lights as other vessels under way.

"(*b*.) All vessels and boats when engaged in fishing with drift-nets shall exhibit two white lights from any part of the vessel where they can be best seen. Such lights shall be placed so that the vertical distance between them shall be not less than 6 feet and not more than 10 feet, and so that the horizontal distance between them measured in a line with the keel of the vessel shall be not less than 5 feet and not more than 10 feet. The lower of these two lights shall be the more forward, and both of them shall be of such a character and contained in lanterns of such construction as to show all round the horizon, on a dark night, with a clear atmosphere, for a distance of not less than 3 miles."

Was approved without discussion.

Captain Hubert (Netherlands) proposed an amendment to be put at the end of this paragraph as follows:—

"It is finally understood and agreed that nothing contained in this Article concerning the lights to be carried and shown by fishing-vessels and boats when actually engaged in fishing shall prevent the Government of any maritime country from making Regulations as to the lights to be carried and shown, and the signals to be made by fishing-vessels and boats actually engaged in fishing in the territorial waters of any such State, nor shall it prevent two or more Maritime States, bordering any seas or waters in which boats and vessels of these States fish in common, from mutually agreeing to express Regulations as to the lights to be carried or shown, and the signals to be made by such boats and vessels when engaged in fishing in such waters."

This was carried without discussion.

Article .—"(*c.*) *Note.* The following subsections (*c*), and (*d*) and (*e*) of this Article only apply to vessels engaged in trawl-fishing, by which is meant the dragging of an apparatus along the bottom of the sea attached to any vessel in motion.

"(*c.*) All vessels under steam when engaged in trawling, having their trawls in the water and not being stationary, in consequence of their gear getting fast to a rock or other obstruction, shall carry on or in front of the foremast, and in the same position as the white light which other steam-ships are required to carry, a lantern showing a white light ahead, a green light on the starboard side, and a red light on the port side, such lantern to be so constructed, fitted, and arranged as to show an unbroken white light over an arc of the horizon of four points of the compass, an unbroken green light over an arc of the horizon of ten points of the compass, and an unbroken red light over an arc of the horizon of ten points of the compass, and it shall be so fixed as to show the white light from right ahead to two points on the bow on each side of the vessel, the green light from two points on the starboard bow to four points abaft the beam on the starboard side, and the red light from two points on the port bow to four points abaft the beam on the port side. Such vessels shall also carry a white light in a lantern, so constructed as to show a clear and unbroken light all round the horizon, the lantern containing such white light to be carried lower than the lantern showing the green, white, and red lights, as aforesaid, so, however, that the actual distance between them shall not be less than 6 feet nor more than 12 feet."

The proposal was adopted without discussion.

"(*d.*) All sailing-vessels of 5 tons gross tonnage, and upwards, engaged in trawling, having their trawl in the water, and not being stationary in consequence of their gear getting fast to a rock or other obstruction, shall carry a white light in a globular lantern, so constructed as to show a clear and unbroken light all round the horizon, and also provide a sufficient supply of red pyrotechnic lights, which shall each burn for at at least thirty seconds, and shall, when so burning, be visible for the same distance under the same conditions as the white light. The white light and one of the pyrotechnic lights shall be shown on approaching to or being approached by another vessel, in sufficient time to prevent collision."

Captain Richard (France) asked what wa sthe object of the provisions as to vessels of 40 and 5 tons. Formerly vessels of 20 tons and over were distinguished.

Captain Donner (Germany) explained that it was thought necessary to arrange special lights for small craft which are not generally sea-going vessels, and for small steamers, as well as for a class of small trawlers on the Baltic which could not carry the fixed mast-head light.

Article. —"All lights mentioned above shall be visible at a distance of 2 miles.

"(*e.*) Sailing vessels of less than 5 tons gross tonnage engaged in trawling, having their trawl in the water, and not being stationary in consequence of their gear getting fast to a rock or other obstruction, shall not be obliged to carry the white light mentioned in section (*d*) of this Article, but, if they do not carry such light, they shall have at hand a lantern showing a bright white light, and shall, on approaching to or being approached by another vessel, exhibit it where it can best be seen in sufficient time to prevent collision; and instead of showing a red pyrotechnic light they may show a flare-up light.

"(*f.*) All vessels and boats when employed in line fishing with their lines out and attached to their lines, and when not at anchor or stationary, shall carry the same lights as vessels when engaged in fishing with drift-nets.

"(*g.*) If a vessel or boat when fishing becomes stationary in consequence of her gear getting fast to a rock or other obstruction, she shall show the light and make the fog-signal for a vessel at anchor.

"(*h.*) Fishing-vessels and boats may at any time use a flare-up in addition to the lights which they are by this Article required to carry and show. All flare-up lights exhibited by a vessel when trawling or fishing with any kind of drag-net shall be shown at the after part of the vessel, excepting that, if the vessel is hanging by the stern to her fishing gear, the flare-up lights shall be exhibited from the bow.

"(*i.*) Every fishing-vessel and every boat when at anchor between sunset and sunrise shall exhibit a white light visible all round the horizon at a distance of at least 1 mile."

The remainder of the proposals of the Committee were carried without discussion.

It being understood by the Conference that Mr. Thomas Gray was obliged to return to England in consequence of illness,

Dr. Sieveking (Germany) proposed, and *Mr. Goodrich* (United States) seconded, a Resolution "that the thanks of the Conference be voted to Mr. Thomas Gray for the very valuable services which he has rendered to the Conference by the assistance which he has given."

The Resolution was carried unanimously.

November 20.

Dr. Sieveking (Germany) proposed an amendment (as paragraph (*k*) to Article), giving vessels fishing with drift-nets and lines the right of way over trawlers.

M. Verbrugghe (Belgium) opposed it.

After some discussion the decision was postponed.

Captain Richard (France) moved the reconsideration of Articles 7, 9, and 10, on the ground that the Conference had decided on them too hastily.

The motion was put and carried.

November 25.

Article 7.—The Report of the Committee on Lights for Small Craft was reconsidered.

Article 7 was carried without discussion.

Article 8.—In Article 8 no alteration was proposed.

Article 9 (*a*).—*Mr. Goodrich* (United States) suggested certain verbal alterations.

Captain Richard (France) pointed out that in many countries there was no distinction made between the lights for fishing-boats and pilot-boats. Was it important to make such a distinction?

Captain Donner (Germany) explained that section (*b*) was introduced at the request of the Delegate for Norway, to meet the requirements of his own pilot-boats.

Mr. Hall (Great Britain) suggested that some form of words should be introduced by the Collocation Committee to clear up any possibility of doubt that a vessel can use her ordinary side lights instead of other special lights; the white light to be shown first.

This was agreed to.

Article 9 (*a*), with this provision, was carried.

Article 9 (*b*).—*M. Flood* (Norway) proposed to omit it on the ground of the inconvenience and uselessness of the coloured light.

Dr. Sieveking (Germany) said that he hoped the Conference would decide on the question of principle as to whether these small boats should have the right of way or not.

Mr. Hall (Great Britain) said that the question of the sole use of the white light on small boats had been carefully considered by the Committee. If the small boats were absolved from the duty of carrying the coloured lights, difficulties would at once be encountered in regard to the Steering and Sailing Rules.

Captain Donner (Germany), who had voted in the minority in the Committee, said that he and his colleagues were now ready to support the proposed Rule in consideration of the difficulty which would arise in the Sailing Rules if the Rule were not passed.

Mr. Hall (Great Britain) moved an amendment upon M. Flood's amendment to the effect that "it is not desirable to alter subsection (*b*)."

This was carried.

Article 9 (*c*) was carried without discussion.

Article 10 (*a*) was carried without discussion.

Article 10 (*b*).—*Captain Richard* (France) objected to fixing the limit of 40 tons. He preferred 20.

Captain Donner (Germany) on behalf of the Committee explained the reasons which had led them to agree on the Rule.

Paragraph (*b*) was adopted.

Article (*a*) was adopted without discussion.

Article (*b*) was also adopted without discussion.

Article (*c*).—*Captain Richard* (France) objected to the use of the lantern showing the three lights, and to the division of trawling vessels into two categories. He moved to refer the Article back to the Committee.

M. Verbrugghe (Belgium) said sailing trawlers and steam trawlers were under different conditions.

Captain Donner (Germany) agreed.

Mr. Hall (Great Britain) said the light mentioned had been used since 1884.

Sir G. Nares (Great Britain) said it was of very great importance to know by the light that a vessel had a net attached to her. It was difficult to choose any other light.

Captain Richard's motion was lost, and the Rule carried.

November 26.

Article .—The paragraph excepting all territorial waters, if so desired by any Power, from the operation of the Rules for lights on fishing-vessels, and allowing two or more States to make their own arrangements for bordering seas, was then discussed.

Captain Hubert (Netherlands) said the Convention to be held at the Hague had been postponed till after the Conference.

Mr. Goodrich (United States) opposed the insertion of the paragraph as conferring the same powers as Article 25.

Dr. Sieveking (Germany) said any Government had the right of altering the Rules, which did not come into force by Treaty. There was nothing in the way of several Powers agreeing to adopt certain Rules in certain seas. The proviso was already well understood.

Mr. Hall (Great Britain) agreed that the amendment was superfluous.

Captain Richard (France) hoped the amendment would be withdrawn.

Captain Hubert withdrew it.

Article (*d*).—*Captain Settembrini* (Italy) moved an amendment for omitting the red pyrotechnic lights on sailing-trawlers of 5 tons or upwards.

He said the burden of providing these lights was too great for the fishermen of the Mediterranean.

Mr. Hall (Great Britain) suggested that the exception might be made by local rules.

Captain Richard (France) supported Captain Settembrini.

The amendment was carried by a vote of 15 to 8. In the minority voted: Belgium, Germany, Great Britain, Guatemala, Russia, Sweden, the Netherlands, United States.

Mr. Hall (Great Britain) pointed out that the result of the vote was that a sailing-trawler up to 50 tons was not bound to carry anything but a white light.

Mr. Goodrich (United States) proposed the reconsideration of the question.

The motion was carried, and

Mr. Carter (Hawaii) moved to substitute "7" tons for "5" tons. This was carried, and the amended paragraph (*d*) was substituted for Captain Settembrini's amendment, leaving thus the pyrotechnic lights unaltered, but changing the limit from 5 to 7 tons.

Paragraph (*e*), as amended in consequence of the previous amendment (5 to 7 tons), was then passed.

Paragraphs (*f*), (*g*), and (*h*) were carried without discussion.

Article (*i*).—*Mr. Hall* (Great Britain) explained that this paragraph was inserted because the fishermen have an idea that the other Rules did not apply to them.

Article 10 and Article .—*Captain Hubert* (Netherlands) moved to except from these Articles regions where their enforcement would prove too difficult in consequence of local conditions.

Dr. Sieveking (Germany) said that this might be left to the Governments. Foreign Governments could be informed of any changes made in the Rules. A note could be appended to the Rules to that effect.

Captan Hubert withdrew his amendment on that understanding.

Article .—*Dr. Sieveking* (Germany) moved an amendment that sailing-vessels should keep out of the way of sailing-vessels engaged in fishing. He said that he had abandoned his former amendment as to trawlers and fishing-vessels, which question, he said, should be left to the Hague Convention.

After some suggestions from *Mr. Hall* (Great Britain) and *Captain Richard* (France), it was carried in the following form:—

"Sailing-vessels under way shall keep out of the way of sailing-vessels or boats engaged in fishing with their nets, lines, or trawls. In daytime such vessels or boats, when under way, shall indicate their occupation by displaying a basket or other efficient signal where it can best be seen. But this Rule shall not give any vessel or boat engaged in fishing the right of obstructing a fairway used by vessels other than fishing-vessels or boats."

The Conference considered Resolutions proposed on behalf of the Lights Committee to the effect:—

1. That the power of lights should be expressed by referring them to one standard.
2. That the minimum power only should be fixed.
3. Incandescent and not arc lights to be used.
4. That the minimum power of light must be found at every point where the light is visible.
5. Whether the ship is heeled over or not.

These Resolutions were adopted by the Conference on the understanding that they were to be appended as a note to the Report.

The 6th Resolution was adopted after considerable discussion as follows:—

"That the colouring of the glasses by which the colour of the light is to be produced shall be so chosen that, if possible, the red light shall have no admixture of green, nor the

green light of red rays, and that both colours can be readily and unmistakably distinguished."

7. That no detailed description of lamps should be internationally adopted.

8. The Regulations should be better enforced.

On *Mr. Hall's* (Great Britain) proposal, the following Resolution was also carried:—

"The above Resolutions of the Committee on Lights, appointed by this Conference, are recommended to the attention of the Powers represented in this Conference."

December 2.

Article 3.—*Captain Shackford* (United States) proposed the optional use of range lights.

Mr. Hall (Great Britain) supported the proposal in regard to the evidence which had been given of the great use of the range lights in inland American waters.

It was carried as follows:—

"All steamers under way may carry an additional white light, similar to the light mentioned in Article 3 (*a*). These lights must be so placed in line with the keel that one must be at least 15 feet higher than the other, and should be in such a position with reference to each other that the lower light shall be forward of the upper one. The vertical distance between these lights must be less than the horizontal distance."

The Conference refused to adopt an amendment moved by the Spanish Delegates, that all vessels under way should keep out of the way of coupled steamers trawling.

The Additional Report of the Committee on Sound Signals was then considered.

On the reading of the recommendation with regard to pilot signals,

Mr. Hall (Great Britain) moved that the question be referred to the Code Signal Committee, and not embodied in the Rules.

After some discussion on the nature of the signal, the Resolution was passed.

Article 10 (*a*).—The proposed Article 10 (*a*) was read and carried:—

"In fog, mist, falling snow, or heavy rain-storms, a drift-net vessel attached to her nets, and a vessel when trawling, dredging, or fishing with any kind of drag-net, and a vessel employed in line-fishing with her lines out, shall at intervals of not more than one minute make a blast with her fog-horn, followed by ringing her bell."

Article 12 (paragraph 1).—The new Article leaves out "a bellows or other" before "mechanical means," and restricts the use of the gong to Chinese waters, as the gong is frequently used on board light-ships in European waters.

Captain Mensing (Germany) wished the gong to be permissive on all vessels.

The wording finally passed was as follows:—

"Art. 12.—A steam-ship shall be provided with a whistle or siren, sounded by steam or other efficient substitute for steam, so placed that the sound may not be intercepted by any obstructions, with an efficient fog-horn to be sounded by mechanical means, and also with an efficient bell. A sailing-vessel of 20 tons gross tonnage and upwards shall be provided with a similar fog-horn and bell.

"*Note.*—In all cases where the Regulations require a bell to be used, a drum may be substituted on board Turkish vessels, and a gong where such articles are commonly used on board small sea-going vessels."

Article 12 (paragraph 2).—The second paragraph of Article 12 was carried as proposed by the Committee:—

"Sailing-vessels and boats of less than 20 tons gross tonnage shall not be obliged to be provided with a mechanical fog-horn; but if not so provided, they shall make with any other instrument an efficient sound signal at intervals of not less than one minute."

Article 12. (*a*) and (*b*).—After some discussion, in which the importance of avoiding any confusion with the short blast helm-signals was pointed out, the proposals of the Committee were carried in the following modified form:—

"Art. 12 (*a*.) A steam-vessel under way shall make with her whistle or siren, at intervals of not more than two minutes, a prolongedblast of from four to six seconds' duration.

"(*b*.) A steam-vessel not at anchor, but stopped and having no way upon her, shall sound, at intervals of not more than two minutes, two such prolonged blasts with an interval of about one second between them.

No change was proposed in section (*c*).

Captain Shackford (United States) said that one second was too short a time for a blast on a fog-horn.

Sir G. Nares (Great Britain), on the part of the Sound Signal Committee, pointed out that the word "short" was not inserted in this section.

Section (*e*) was proposed as follows :—

"A steam-vessel, when her engines are going full speed astern, shall sound on her whistle three short blasts."

Captain Richard (France) objected to this Rule in cases where the vessels were not in sight of one another; and *Captain Mensing* (Germany) supported him.

The question was voted on, and the amendment was negatived by 15 to 5; Austria, Denmark, Italy, the Netherlands, and the United States voting in the minority.

A long discussion took place over paragraph (*f*), giving a special signal to vessels at anchor at sea in a fairway. It was decided by 12 to 8 that the principle should be adopted, and referred to the Collocation Committee.

France, Germany, Belgium, China, Chile, Russia, Spain, and Sweden voted in the minority.

December 3.

Article 4.—*Captain Salvesen* (Norway) moved that Article 4 be reconsidered so as to allow for the length of the tow.

Mr. Hall (Great Britain) supported the proposal, as according to the present wording a tug would be obliged to hoist a third light if she took even a second barge in tow.

After a long discussion as to the wording of the amendment, the Conference agreed to the following addition to the Rule :—

To add after the words "such lights" the following: "Provided that the length of the tow, measuring from the stern of the towing vessel to the stern of the last vessel towed, exceeds 600 feet."

The amendment of *M. Seoane* (Spain), proposing that all vessels under way should get out of the way of coupled steamers trawling, was discussed.

It was opposed by *Mr. Hall* (Great Britain) on the ground that in adopting the amendment the Conference would be running counter to the general principle of the Rules of the Road at Sea, and that the case was not sufficiently strong to justify such an exception.

The amendment was voted on, and lost by 14 to 9, Belgium, Chile, France, Italy, Mexico, Portugal, Spain, Siam, and Venezuela voting in the minority.

Article 12 (*a*). (*Sound Signals for Tows.*)—On the amendment of the Committee on Sound Signals as to sound signals for tows, considerable differences of opinion arose.

It was resolved, finally, to reconsider the question whether a sound signal was to be adopted for a sailing-vessel towing.

Mr. Hall (Great Britain) stated that he would vote against any special signal, in regard to the facts that the occasions are rare when such signals are wanted, and to the difficulty of finding such a signal at all.

The Conference decided in that sense.

Captain Mensing (Germany) moved that an optional signal should be introduced for use on sailing-vessels.

Seven voted in the affirmative, and 12 in the negative. Belgium, Denmark, Germany, Hawaii, Italy, Japan, and Holland voted in the minority.

Captain Richard (France), with the view to separate the question of a steam-vessel towing from a sailing-vessel towing, proposed the following :—

"A steam-vessel when towing shall at intervals of not more than two minutes sound upon her whistle, siren, or fog-horn three blasts in succession, viz., one prolonged blast followed by two short ones."

This was adopted.

He also moved to reconsider the question of giving sailing-vessels towing a signal.

This was opposed by Captain Mensing (Germany), and the discussion was adjourned. (See 4th December.)

December 4.

The discussion on Captain Richard's amendment (to restore the words "a sailing-vessel") was proceeded with.

Sir G. Nares explained the position of the Committee, and stated his reasons for supporting the amendment.

Captain Donner (Germany) stated that a sailing-ship often took another in tow in the North Sea.

Mr. Hall (Great Britain) said that such exceptional cases might be dealt with by local Rules. He adhered to his objection formerly expressed.

Mr. Carter (Hawaii) said the Rule would be important in the Pacific, where steam-tugs were rare.

Captain Malmberg (Sweden) asked if the signal proposed would override the signals relating to the wind under Article 14, or be additional to them.

It was explained that the signal should override the signals provided for in Article 14.

A vote was taken:—

Eighteen were in the affirmative, 5 in the negative. Belgium, Germany, Great Britain, Mexico, and Russia composed the minority.

Article 12 (*g*).—*Mr. Hall* (Great Britain) proposed to add at the end of the clause the following:—

"When more than one vessel is being towed, each vessel towed shall sound this signal on hearing the sound signal of an approaching vessel."

Captain Richard (France) opposed the addition.

Sir G. Nares (Great Britain), on behalf of the Committee, moved an amendment:—

"A vessel towing shall at intervals of not more than two minutes, and the vessel towed, may sound three blasts in succession, viz., one prolonged blast followed by two short blasts."

The object was, he explained, when several vessels were being towed, to enable each one, if necessary, to give a signal showing that there was yet another vessel behind. It was not proposed that each vessel should repeat the signal the whole time the fog lasted.

A vote was taken, and the paragraph was passed with one dissentient vote (France).

Captain Norcross (United States) moved that the form of signal should be changed.

The motion was lost.

Sir G. Nares (Great Britain), on behalf of the Sound Signal Committee, moved that the signals used by towing-vessels should be in lieu of those provided for in sections (*a*), (*b*), and (*c*,) so that the steamer towing shall not be obliged to make her one blast, and the vessel towed shall not be obliged to make her sailing-vessel's signal.

This was carried.

Mr. Hall (Great Britain) pointed out that the vessel towed was in the category of a sailing-vessel, and therefore the signal must be given on the fog-horn.

The suggestion was adopted.

The whole paragraph (*g*) was then carried as follows:—

"A steam-vessel and a sailing-vessel, when towing, shall, instead of the signals provided under sections (*a*) and (*c*) of this Article, at intervals of not more than two minutes sound on the whistle, siren, or fog-horn three blasts in succession, viz., one prolonged blast followed by two short blasts.

A vessel towed may also give this signal on her fog-horn, but not on her whistle or siren.

Article 12 (*h*).—*Sir G. Nares* (Great Britain) then proposed a signal to indicate, "The way is off my ship, you may feel your way past me."

Captain Malmberg (Sweden) opposed it, as likely to entice steamers to draw too near each other.

Captain Mensing (Germany) also opposed it.

Captain Richard (France) thought the Rule would be better in the Signal Code. Only strictly indispensable sound signals should be inserted in the Rules.

Mr. Hall (Great Britain) said he would vote for the signal, which he thought a good one, if optional. A strong representation had been made by the Board of Trade, and a strong desire for it expressed by sailors. It would be buried in the International Code Signal Book.

The question was put, and carried by 15 to 4 in favour of the signal.

France, Germany, Spain, and Sweden voted in the minority.

Paragraph (*h*) was then carried as follows:—

"A steam-vessel wishing to indicate to another 'The way is off my ship, you may feel your way past me,' may sound on her whistle or siren three blasts, viz., short, long, short, with intervals of about one second between them."

Article 12 (*i*).—*Captain Mensing* (Germany) proposed a special signal for vessels not under command and vessels laying telegraph cables.

Sir G. Nares (Great Britain), on behalf of the Sound Signal Committee, opposed any increase in the number of signals.

Mr. Hall (Great Britain) said he would vote for a signal, but in the hope that one of the existing signals could be utilized.

Captain Richard (France) said the signal was as necessary, and more so, than the last voted on.

The Conference decided by 15 to 4 that a signal should be given. Austria-Hungary, China, Hawaii, and Italy voted in the minority.

The duty of selecting the signal was referred to the Sound Signal Committee.

December 5.

Sir G. Nares (Great Britain), on behalf of the Sound Signal Committee, presented a scheme for the two fog signals for a vessel not under command and a vessel laying or picking up a telegraph cable.

The first proposal made was as follows :—

"A ship under way which is unable to get out of the way of an approaching vessel, through being not under command, or unable to manœuvre as required by these Regulations, shall, on hearing the fog signal of an approaching vessel, sound on her whistle, siren, or fog-horn four short blasts."

It was carried, with the addition of the words "in answer" after "sound," in order to indicate that the signal is to be an answer to each signal sounded by an approaching vessel.

The second proposal was as follows :—

"A ship employed in laying or picking up a telegraph cable shall, on hearing the fog-signal of an approaching vessel, sound in answer on her whistle, siren, or fog-horn three prolonged blasts in succession."

The proposal was carried.

The question of pilot signals was passed over in accordance with a previous Resolution, deciding that the Conference should not discuss them under the Rules of the Road, but should relegate the subject to Committee No. 2, dealing with General Division VIII.

Article 19.—*Sir G. Nares* (Great Britain), on the part of the Sound Signal Committee, proposed to substitute, "My engines are going full speed astern," for the former wording, "I am going full speed astern."

The question was carried.

Article .—On behalf of the Fog Signal Committee, *Sir G. Nares* (Great Britain) moved an amendment on an Article already carried.

After some discussion as to the duration of a flare-up light and other questions, the Article was carried as follows :—

"Art. .—Every ship may, if necessary, in order to attract attention to the lights which she is by these Regulations required to carry, show a flare-up light, or use any detonating signal that cannot be mistaken for a distress signal.

Mr. Goodrich (United States) moved to insert, after the word "attention," the words, "to prevent risk of collision," but the amendment was lost.

Article 27.—*Sir G. Nares* (Great Britain) moved an amendment to the distress signals during day : to add—

"4. Rockets or shells bursting in the air with a loud report, and throwing stars of any colour or description, fired one at a time, at short intervals.

"5. A continuous sounding with any fog signal apparatus."

These signals were adopted by the Sound Signal Committee, as referred to them by the Conference.

The Conference passed the additions proposed.

Sir G. Nares (Great Britain) then moved an additional distress signal for the night :—

"4. A continuous sounding with any fog signal apparatus," which was also carried.

The question was then discussed as to whether a pilot-vessel wishing to offer her pilotage services should be given a special fog signal for that purpose.

Sir G. Nares (Great Britain), on behalf of the Fog Signal Committee, advocated such a special signal.

A division was taken : 11 voted for and 9 against. France, Germany, Great Britain, Hawaii, Mexico, Portugal, Russia, Sweden, and the Netherlands voted in the minority.

The Conference also decided that a signal should be found for a vessel wanting a pilot.

Mr. Hall then moved that Committee No. 2 be requested to report as to the nature of the signals for pilots ; such signals having no connection with the Rules of the Road.

The motion was carried.

December 9.

On the motion of *Mr. Goodrich* (United States), the Conference decided unanimously against the adoption of course-indicating sound signals in foggy or thick weather.

An intercalatory Report from the Collocation Committee was read recommending the reconsideration of M. Flood's (Norway) amendment to Article 3, passed November 14, as to the position of the side lights.

The Conference determined to reconsider the question, and referred it to the Committee on Lights.

The Report of the Committee upon the subject of a uniform load mark was read.

Mr. Hall (Great Britain) stated that though most anxious that the matter should become a subject for international agreement, yet, having regard to the fact that the Committee reported it as not ripe for consideration by the Conference, he would bow to the decision of the Committee.

The Report of the Committee was adopted unanimously.

The Report of the Committee upon Division XIII (the establishment of a permanent International Marine Commission) was then read.

The minority Report of M. August Schneider (Denmark) was also read.

M. Schneider hoped that the question would be left open, so that any Government, when the time was ripe, could launch the plan again.

M. Flood (Norway) supported this proposal.

Dr. Sieveking (Germany) opposed it. He pointed out the impracticable nature of the scheme for a Maritime Commission, and thought that the wording of the Report was sufficient.

M. Garde (Denmark) said that he had no instructions from his Government, but thought that much good would result from the establishment of a Bureau which should lay before every Marine Conference particular proposals submitted by private persons.

Mr. Hall (Great Britain, Chairman of the Committee) pointed out that such a Bureau did not come under the consideration of the Committee.

The Report of the Committee was adopted.

December 12.

M. Flood (Norway) proposed his Resolution recommending to the Powers the advisability of a Bureau of Maritime Information.

M. Garde (Denmark) explained that what was wanted in his country was not a permanent Commission, but a link or medium between the different countries where proposals could be sent from any country which does not have a regular Board of Trade. He instanced the Telegraphic Convention of 1885, by which a Central Institution was established.

Mr. Hall (Great Britain, Chairman of the Committee on Division XIII) opposed the proposal, which amounted, he said, to a demand on the part of the Powers which had no Board of Trade for an international one, of which Great Britain should pay 65 per cent. of the expenses. The Powers could consider the question, if they chose, without any recommendation from the Conference. The Scandinavian Powers, if they desired it, could form a Bureau of their own.

Dr. Sieveking (Germany) said the German Government was opposed to the scheme. He saw no real difference between the Bureau and the Commission against which the Committee had reported. Most Governments had their Boards of Trade, and discussed matters of common interest internationally. The Bureau would only result in loss of time.

Captain Sampson (United States) saw a great difference between a Commission and a Bureau. He instanced the International Bureau of Weights and Measures. The Committee on Buoyage could testify to the expense caused by the want of a uniform system. A Bureau might put an end to such diversity.

The Resolution was put in the following words :—

"That the Conference recommend that the advisability of a Bureau of Maritime Information should be considered by the Governments of the maritime nations."

Seven voted in the affirmative and 12 in the negative. Denmark, Hawaii, Japan, Norway, Siam, the Netherlands, and the United States voted in the minority.

December 16.

Article 3.—*M. Flood's* (Norway) amendment as to the position of the side lights was reconsidered.

A Report of the Committee on Lights was read, recommending that the Rule should stand as it was, except as regards sailing-vessels, provided it was adopted universally.

Mr. Hall (Great Britain) pointed out that great expense would be incurred by existing steam-vessels, some of which would have to be reconstructed. As regards sailing-vessels, the Report of the Committee was conclusively against the proposal.

M. Flood reiterated his arguments.

Dr. Sieveking said that, in view of the objections of Great Britain, he would not vote

for the insertion of the Rule into the Regulations. A recommendation might be made in a similar sense and appended to the Rules.

M. Flood's amendment was lost.

Dr. Sieveking (Germany) moved a Resolution—

"That it is approved by the Conference, and recommended to the attention of the Powers represented thereat, that green and red side lights should be placed in steam-vessels not forward of the masthead light, and that this Resolution be inserted in Appendix 3 to the Report of the Committee on Collocation of the Rules."

The Resolution was adopted.

The Report of the Committee on Life-saving Systems and Devices was read.

The several Resolutions proposed in the Report were put to the Conference.

Resolution 1. (See Protocol, 20th December.)

Resolutions 2 and 3 were carried.

Resolution No. 4 was amended, on *Mr. Hall's* (Great Britain) proposal, by the substitution of the word "uniform" for "a set of," so as to read, "prepare uniform instructions," and carried in that form.

In the fourth paragraph of the Resolution the word "pyrotechnic" was inserted on *Captain Mensing's* (Germany) proposal, so as to read "blue pyrotechnic light."

The fifth Resolution was carried without change, and the Report adopted in its entirety by the Conference.

The Report of the Committee on General Divisions II, IV, and VI was read and considered.

The Report on General Division II was adopted.

In the Report on General Division IV, *Captain Richard* (France) moved that the smallest letters of the name of a ship should not be less that 8 inches high.

The proposal was lost by 9 votes to 10. Belgium, China, Chile, France, Russia, Spain, Sweden, Siam, and the Netherlands voted in the minority.

The Conference adopted the first proposition in the Report of the Committee on Division IV.

After some discussion as to the character to be used in the designation of the draught, the second proposition was carried.

The Report of the Committee in General Division VI was read.

Captain Richard (France) objected to the imposition of tests for colour-blindness.

Captain Sampson (United States) pointed out that the Committee had only recommended that each Government should provide a place where men and boys who propose to go to sea could have their eyesight tested. It was a voluntary matter.

Mr. Hall (Great Britain) agreed that it would be impossible to make the recommendation into a Rule.

Captain Richard (France) said he only desired guarantees of this sort for master mariners.

Captain Sampson (United States) agreed, and quoted instances showing the danger of not having such tests.

Mr. Hall (Great Britain) said that if such examinations were instituted it would prevent men from going to sea who could never rise to the grade of an officer.

Captain Richard (France) moved to strike out the last three lines of paragraph No. 1 ("and no man or boy should be permitted to serve on board any vessel in the capacity of seaman, or where he will have to stand look-out, whose visual power is below one-half normal, or who is red or green colour-blind").

The motion was lost. France, Germany, Mexico, Russia, and Siam voting in the minority.

Paragraph 2 was adopted, *Captain Richard* (France) suggesting the addition of the words, "or as a pilot."

The third paragraph was adopted without alteration.

The Report as amended was adopted.

The Report of Committee No. 2, Division VII (Ocean Laws), was then read.

After some discussion as to the precautions to be taken by fishermen on the Banks, the Report was adopted.

The Report of Committee No. 2 on Division VIII (Night Signals for communicating Information at Sea) was read and adopted.

December 18.

The Report of the Collocation Committee was read.

An amendment put by *Captain Shackford* (United States) to strike out "two" and substitute "three" before miles in the last line of Article 2 (*b*) and (*c*) was lost.

Dr. Sieveking (Germany) moved an amendment in Article 2 (*d*) to insert the words, "more than half a point," after the word "seen."

Mr. Hall (Great Britain) moved, in lieu of this amendment, to insert as a note to Appendix (B) the following:—

"Side lights should be so screened as to prevent the most convergent rays of the lights being seen more than half a point across the bows."

Captain Salvesen (Norway) moved that the Conference adopt the Rules of the Board of Trade as to the screening of side lights.

Mr. Hall's amendment was carried, after a long discussion, by 16 to 3. Austria, Russia, and the United States voted in the minority.

Dr. Sieveking (Germany) moved in Article 4 (*a*), instead of the words, "in the same position," to insert the words, "at the same height," and after the words, "Article 2 (*a*)," nsert the words "where they can best be seen."

Mr. Hall (Great Britain) supported the amendment on the grounds that it might be difficult for a vessel out of command to hoist a light in front of the foremast, or it might be desirable to hoist it aft.

It was carried by 10 votes to 9. Brazil, Belgium, China, Chile, France, Mexico, Sweden, Siam, and the Netherlands voted in the minority.

Captain Mensing (Germany) proposed in Article 4 (*a*) to strike out the words, "in globular lanterns" and insert, after "visible," the words, "all around the horizon."

Mr. Hall (Great Britain) supported the change, on the ground that the best lanterns were flat at top and bottom.

The amendment was carried.

The same change was made in Article 4 (*b*).

Dr. Sieveking (Germany) moved an amendment in Article 7, 1 (*b*), as to the position of the lanterns, which was lost.

December 19.

Mr. Goodrich (United States) moved an amendment, which was originally proposed by the British Delegates, to Article 22:—

"When, in consequence of thick weather or other causes, two ships find themselves so close to each other as to make it doubtful whether by the action of one ship alone a collision can be avoided, the ship which by the above Article is directed to keep her course and speed shall also take such action as will best avoid collision."

He said he was acting by the advice of a distinguished New York Judge. He thought it was necessary to place this provision so as to catch the mariner's eye immediately after the Rule which provides that the holding-on ship should keep her course and speed.

Mr. Hall (Great Britain) pointed out that the proposed amendment had been withdrawn in deference to the wishes of the Conference, and other words introduced into the general Rule to make it apply to cases of collision.

Dr. Sieveking (Germany) strongly opposed the amendment, on the ground that it made the application of the new Rule as to keeping speed doubtful. He said that if the amendment were accepted it would entail the reconsideration of all the Rules.

Mr. Hall (Great Britain) said that he would bow to the former decision of the Conference, and vote against reconsideration. The whole matter had been most carefully discussed.

On the vote for reconsideration being taken, the United States were in a minority of one.

Mr. Hall (Great Britain) moved an amendment to Article 7 (*c*) as follows:—

"Small steam-boats, such as are carried by sea-going vessels, may carry the white light at a less height than 9 feet above the gunwale, but it must be carried above the combined lantern mentioned in (*b*)."

This was to meet the case of boats which could not conveniently have masts.

It was carried.

Dr. Sieveking (Germany) moved to add to Articles 7 and 9 the words, "The vessels referred to in this Article shall also not be obliged to carry the light prescribed by Article 4 (*a*) and Article 11, last paragraph."

This was to correct an oversight, as it was not intended that small craft should carry the out-of-command lights and lights for vessels aground.

It was carried.

Captain Malmberg (Sweden) proposed an amendment, which was carried in the folowing modified form:—

Article 8. At the beginning insert the word "near" before "approach."

Dr. Sieveking (Germany) proposed an amendment which, at *Mr. Hall's* suggestion, was modified and carried in the following form:—

Article 8, paragraph 2. Instead of the words "have at hand temporarily," insert the words, "shall have their side lights lighted ready for use, and shall flash or show them at short intervals."

Paragraph 3 to be struck out.

It was carried.

Dr Sieveking (Germany) proposed in Article 9, (*b*) 1, to read, instead of "four" points abaft the beam, "two" points, in order that the light should show in the same way as the side lights.

The amendment was carried.

Captain Settembrini (Italy) moved an amendment, which he modified at *Mr. Hall's* suggestion, and which was passed in the following form:—

"In the Mediterranean Sea, all vessels referred to in subsection (*b*) 2 may show the flare-up light instead of the pyrotechnic light."

Dr. Sieveking (Germany) moved to insert in Article 2, instead of the words, "in a globular lantern so constructed," the words, "of such a character."

This was adopted.

December 20.

Dr. Sieveking (Germany) proposed in Article 21, instead of the words "and speed," to insert the words, "and where one of two crossing vessels is to keep out of the way the other shall keep her course and speed."

He said that the Rule as it stood was applicable to overtaken vessels, and that he desired to except them from the Rule.

Mr. Hall (Great Britain) opposed the change. What was wanted was a general rule which would clear up the doubt as to the meaning of the phrase "keep your course." He was against exceptions.

Mr. Goodrich (United States) pointed out that the addition of the words "and collision" in Rule 28 covered exceptional cases in which strict adherence to Rule 21 would be dangerous.

A vote was taken, and resulted in 2 votes for and 16 against; Germany and Siam voting in the minority.

Captan Richard (France) moved an amendment to eliminate Article 27 from the Regulations, and to add it to Appendix (B) of the Report as a Resolution recommended to the consideration of the Powers.

He said that the rule as to ships of war in line might lead to international difficulties.

Mr. Hall acceded to the proposal, which was adopted.

Captain Sampson (United States) proposed to omit the words, "and collision," after "navigation," in Article 28.

Mr. Hall pointed out that the words had been inserted in order to point out to the sailor that the holding-on vessel was bound to do what she could to prevent collision.

Ten voted in the affirmative, and 10 in the negative, so the amendment was not carried. Brazil, Chile, Denmark, France, Germany, Russia, Spain, Siam, and the Netherlands voted with the United States.

Various verbal corrections were proposed and considered, and the discussion on the Rules was brought to an end.

Mr. Goodrich (United States) proposed to insert in the Rules a provision as to the duty of masters to afford assistance in case of collision, taken from the English Act.

Captain Richard (France) objected to its insertion in the Rules, as it required legislative sanction.

Mr. Goodrich moved that the Resolution should be annexed to the Rules in the Appendix.

It was passed in the following form:—

"In every case of collision between two vessels it shall be the duty of the master or person in charge of each vessel, if and so far as he can do so without serious danger to his own vessel, crew, and passengers (if any), to stay by the other vessel until he has ascertained that she has no need of further assistance, and to render to the other vessel, her master, crew, and passengers (if any), such assistance as may be practicable and as may be necessary in order to save them from any danger caused by the collision, and also to give to the master or person in charge of the other vessel the name of his own vessel and her port of registry, or the port or place to which she belongs, and also the name of the ports and places from which, or to which, she is bound."

December 30.

Captain Richard (France) proposed that a Final Act be prepared, to be signed by the President, showing the Resolutions adopted by the Conference.

The proposal was carried.

The Report of General Division IX was adopted.

The Report of General Division XII was also adopted after some discussion as to the rules as to buoyage in American waters.

Mr. Goodrich (United States) proposed that the Final Report of the Collocation Committee be adopted.

Mr. Verney (Siam) desired further consideration of the Rules as drawn up, on the ground that they needed more careful editing.

Mr. Goodrich's motion was, however, adopted, and the Rules, as amended, carried

December 31.

The Reports on General Divisions X and XI were read and adopted.

Mr Hall proposed, and *Admiral Kaznakoff* (Russia) seconded, a vote of thanks to the President, Rear-Admiral Franklin, which was carried.

Dr. Sieveking (Germany) proposed, and *Captain Richard* (France) seconded, a vote of thanks to the Secretaries.

The Conference was then declared at an end.

Appended is a copy of the Rules of the Road as finally adopted, and of the Resolutions connected therewith.

The Resolutions based upon the Reports will be found under Inclosure 16.

Appendix (A.)

REGULATIONS FOR PREVENTING COLLISIONS AT SEA.

Preliminary.

THESE Rules shall be followed by all vessels upon the high seas and in all waters connected therewith, navigable by sea-going vessels.

In the following Rules every steam-vessel which is under sail and not under steam is to be considered a sailing-vessel, and every vessel under steam, whether under sail or not, is to be considered a steam-vessel.

The word "steam-vessel" shall include any vessel propelled by machinery.

A vessel is "under way" within the meaning of these Rules, when she is not at anchor, or made fast to the shore, or aground.

Rules concerning Lights, &c.

The word "visible" in these Rules when applied to lights shall mean visible on a dark night, with a clear atmosphere.

Article 1. The Rules concerning lights shall be complied with in all weathers from sunset to sunrise, and during such time no other lights which may be mistaken for the prescribed lights shall be exhibited.

Art. 2. A steam-vessel when under way shall carry—

(*a.*) On or in front of the foremast, or if a vessel without a foremast, then in the fore part of the vessel, at a height above the hull of not less than 20 feet, and if the breadth of the vessel exceeds 20 feet, then at a height above the hull not less than such breadth, so, however, that the light need not be carried at a greater height above the hull than 40 feet, a bright white light, so constructed as to show an unbroken light over an arc of the horizon of 20 points of the compass, so fixed as to throw the light 10 points on each side of the vessel, viz., from right ahead to 2 points abaft the beam on either side, and of such a character as to be visible at a distance of at least 5 miles.

(*b.*) On the starboard side a green light so constructed as to show an unbroken light over an arc of the horizon of 10 points of the compass, so fixed as to throw the light from right ahead to 2 points abaft the beam on the starboard side, and of such a character as to be visible at a distance of at least 2 miles.

(*c.*) On the port side a red light so constructed as to show an unbroken light over an arc of the horizon of 10 points of the compass, so fixed as to throw the light from right ahead to 2 points abaft the beam on the port side, and of such a character as to be visible at a distance of at least 2 miles.

(*d.*) The said green and red side-lights shall be fitted with inboard screens projecting at least 3 feet forward from the light, so as to prevent these lights from being seen across the bow.

(*e.*) A steam-vessel when under way may carry an additional white light similar in construction to the light mentioned in subdivision (*a*). These two lights shall be so placed in line with the keel that one shall be at least 15 feet higher than the other, and in such a position with reference to each other that the lower light shall be forward of the upper one. The vertical distance between these lights shall be less than the horizontal distance.

Art. 3. A steam-vessel when towing another vessel shall, in addition to her side-lights, carry two bright white lights in a vertical line one over the other, not less than 6 feet apart, and when towing more than one vessel shall carry an additional bright white light 6 feet above or below such lights, if the length of the tow measuring from the stern of the towing-vessel to the stern of the last vessel towed exceeds 600 feet. Each of these lights shall be of the same construction and character, and shall be carried in the same position, as the white light mentioned in Article 2 (*a*), excepting the additional light, which may be carried at a height of not less than 14 feet above the hull.

Such steam-vessel may carry a small white light abaft the funnel or aftermast for the vessel towed to steer by, but such light shall not be visible forward of the beam,

Art. 4. (*a.*) A vessel which from any accident is not under command shall carry at the same height as the white light mentioned in Article 2 (*a*), where they can best be seen, and if a steam-vessel, in lieu of that light, two red lights, in a vertical line one over the other, not less than 6 feet apart, and of such a character as to be visible all round the horizon at a distance of at least 2 miles; and shall by day carry in a vertical line one over the other, not less than 6 feet apart, where they can best be seen two black balls or shapes, each 2 feet in diameter.

(*b.*) A vessel employed in laying or in picking up a telegraph cable shall carry in the same position as the white light mentioned in Article 2 (*a*), and if a steam-vessel, in lieu of that light, three lights in a vertical line one over the other, not less than 6 feet apart. The highest and lowest of these lights shall be red, and the middle light shall be white, and they shall be of such a character as to be visible all round the horizon, at a distance of at least 2 miles. By day she shall carry in a vertical line one over the other, not less than 6 feet apart, where they can best be seen, three shapes not less than 2 feet in diameter, of which the highest and lowest shall be globular in shape and red in colour, and the middle one diamond in shape and white.

(*c.*) The vessels referred to in this Article, when not making way through the water, shall not carry the side-lights, but when making way shall carry them.

(*d.*) The lights and shapes required to be shown by this Article are to be taken by other vessels as signals that the vessel showing them is not under command, and cannot therefore get out of the way.

These signals are not signals of vessels in distress and requiring assistance. Such signals are contained in Article 31.

Art. 5. A sailing-vessel under way, and any vessel being towed, shall carry the same lights as are prescribed by Article 2 for a steam-vessel under way, with the exception of the white lights mentioned therein, which they shall never carry.

Art. 6. Whenever, as in the case of small vessels under way during bad weather, the green and red side-lights cannot be fixed, these lights shall be kept at hand, lighted and ready for use; and shall, on the approach of or to other vessels, be exhibited on their respective sides in sufficient time to prevent collision, in such manner as to make them most visible, and so that the green light shall not be seen on the port side nor the red light on the starboard side, nor if practicable more than 2 points abaft the beam on their respective sides.

To make the use of these portable lights more certain and easy, the lanterns containing them shall each be painted outside with the colour of the light they respectively contain, and shall be provided with proper screens.

Art. 7. Steam-vessels of less than 40, and vessels under oars or sails, of less than 20 tons, gross tonnage, respectively, when under way, shall not be obliged to carry the lights mentioned in Article 2 (*a*), (*b*), and (*c*), but if they do not carry them they shall be provided with the following lights:—

1. Steam-vessels of less than 40 tons shall carry:

(*a.*) In the fore part of the vessel, or on or in front of the funnel, where it can best be seen, and at a height above the gunwale of not less than 9 feet, a bright white light constructed and fixed as prescribed in Article 2 (*a*), and of such a character as to be visible at a distance of at least 2 miles.

(*b.*) Green and red side-lights constructed and fixed as prescribed in Article 2 (*b*) and (*c*), and of such a character as to be visible at a distance of at least 1 mile, or a combined lantern showing a green light and a red light from right ahead to 2 points abaft the beam on their respective sides. Such lantern shall be carried not less than 3 feet below the white light.

2. Small steam-boats, such as are carried by sea-going vessels, may carry the white light at a less height than 9 feet above the gunwale, but it shall be carried above the combined lantern mentioned in subdivision 1 (*b*).

3. Vessels under oars or sails, of less than 20 tons, shall have ready at hand a lantern with a green glass on one side and a red glass on the other, which, on the approach of or to other vessels, shall be exhibited in sufficient time to prevent collision, so that the green light shall not be seen on the port side nor the red light on the starboard side.

The vessels referred to in this Article shall not be obliged to carry the lights prescribed by Article 4 (*a*) and Article 11, last paragraph.

Art. 8. Pilot-vessels, when engaged on their station on pilotage duty, shall not show the lights required for other vessels, but shall carry a white light at the mast-head, visible all round the horizon, and shall also exhibit a flare-up light or flare-up lights at short intervals, which shall never exceed 15 minutes.

On the near approach of or to other vessels they shall have their side-lights lighted, ready for use, and shall flash or show them at short intervals, to indicate the direction in which they are heading, but the green light shall not be shown on the port side, nor the red light on the starboard side.

A pilot-vessel of such a class as to be obliged to go alongside of a vessel to put a pilot on board may show the white light instead of carrying it at the masthead, and may, instead of the coloured lights above mentioned, have at hand ready for use a lantern with a green glass on the one side and a red glass on the other, to be used as prescribed above.

Pilot-vessels, when not engaged on their station on pilotage duty, shall carry lights similar to those of other vessels of their tonnage.

Art. 9. Fishing-vessels and fishing-boats, when under way and when not required by this Article to carry or show the lights therein named, shall carry or show the lights prescribed for vessels of their tonnage under way.

(*a.*) Vessels and boats when fishing with drift-nets shall exhibit two white lights from any part of the vessel where they can best be seen. Such lights shall be placed so that the vertical distance between them shall be not less than 6 feet and not more than 10 feet, and so that the horizontal distance between them, measured in a line with the keel, shall be not less than 5 feet and not more than 10 feet. The lower of these two lights shall be the more forward, and both of them shall be of such a character as to show all round the horizon, and to be visible at a distance of not less than 3 miles.

(*b.*) Vessels when engaged in trawling, by which is meant the dragging of an apparatus along the bottom of the sea—

1. If steam-vessels, shall carry in the same position as the white light mentioned in Article 2 (*a*) a tricoloured lantern so constructed and fixed as to show a white light from right ahead to 2 points on each bow, and a green light and a red light over an arc of the horizon from 2 points on either bow to 2 points abaft the beam on the starboard and port side respectively; and not less than 6 nor more than 12 feet below the tricoloured lantern, a white light in a lantern, so constructed as to show a clear, uniform, and unbroken light all round the horizon.

2. If sailing-vessels of 7 tons gross tonnage and upwards shall carry a white light in a lantern so constructed as to show a clear, uniform, and unbroken light all round the horizon, and shall also be provided with a sufficient supply of red pyrotechnic lights, which shall each burn for at least thirty seconds, and shall be shown on the approach of or to other vessels in sufficient time to prevent collision.

In the Mediterranean Sea the vessels referred to in subdivision (*b*) 2 may use a flare-up light in lieu of a pyrotechnic light.

All lights mentioned in subdivision (*b*) 1 and 2 shall be visible at a distance of at least 2 miles.

3. If sailing-vessels of less than 7 tons gross tonnage, shall not be obliged to carry the white light mentioned in subdivision (*b*) 2 of this Article, but if they do not carry such light they shall have at hand, ready for use, a lantern showing a bright white light, which shall, on the approach of or to other vessels, be exhibited where it can best be seen, in sufficient time to prevent collision; and they shall also show a red pyrotechnic light, as prescribed in subdivision (*b*) 2, or in lieu thereof a flare-up light.

(*c.*) Vessels and boats when line-fishing with their lines out and attached to their lines, and when not at anchor or stationary, shall carry the same lights as vessels fishing with drift-nets.

(*d.*) Fishing-vessels and fishing-boats may at any time use a flare-up light in addition to the lights which they are by this Article required to carry and show. All flare-up lights exhibited by a vessel when trawling or fishing with any kind of drag-net shall be shown at the after-part of the vessel, excepting that, if the vessel is hanging by the stern to her fishing-gear, they shall be exhibited from the bow.

(*e.*) Every fishing-vessel and every boat when at an anchor shall exhibit a white light visible all round the horizon at a distance of at least 1 mile.

(*f.*) If a vessel or boat when fishing becomes stationary in consequence of her gear getting fast to a rock or other obstruction, she shall show the light and make the fog signal prescribed for a vessel at anchor respectively. (See Article 15 (*d*), (*e*), and last paragraph.)

(*g.*) In fog, mist, falling snow, or heavy rain-storms, drift-net vessels attached to their nets, and vessels when trawling, dredging, or fishing with any kind of drag-net, and vessels line-fishing with their lines out, shall, if of 20 tons gross tonnage or upwards, respectively, at intervals of not more than 1 minute, make a blast; if steam-vessels, with the whistle or siren, and if sailing vessels, with the fog-horn, each blast to be followed by ringing the bell.

(*h.*) Sailing-vessels or boats fishing with nets or lines, or trawls, when under way, shall in daytime indicate their occupation to an approaching vessel by displaying a basket, or other efficient signal, where it can best be seen.

The vessels referred to in this Article shall not be obliged to carry the lights prescribed by Article 4 (*a*) and Article 11, last paragraph.

Art. 10. A vessel which is being overtaken by another shall show from her stern to such last-mentioned vessel a white light or a flare-up light.

The white light required to be shown by this Article may be fixed and carried in a lantern, but in such case the lantern shall be so constructed, fitted, and screened that it shall throw an unbroken light over an arc of the horizon of 12 points of the compass, viz., for 6 points from right aft on each side of the vessel, so as to be visible at a distance of at least 1 mile. Such light shall be carried as nearly as practicable on the same level as the side-lights.

Art. 11. A vessel under 150 feet in length, when at anchor, shall carry forward, where it can best be seen, but at a height not exceeding 20 feet above the hull, a white light, in a lantern so constructed as to show a clear, uniform, and unbroken light, visible all round the horizon at a distance of at least 1 mile.

A vessel of 150 feet or upwards in length, when at anchor, shall carry, in the forward part of the vessel, at a height of not less than 20 and not exceeding 40 feet above the hull, one such light, and at or near the stern of the vessel, and at such a height that it shall be not less than 15 feet lower than the forward light, another such light.

The length of a vessel shall be deemed to be the length appearing in her certificate of registry.

A vessel aground in or near a fairway shall carry the above light or lights and the two red lights prescribed by Article 4 (*a*).

Art. 12. Every vessel may, if necessary, in order to attract attention, in addition to the lights which she is by these Rules required to carry, show a flare-up light, or use any detonating signal that cannot be mistaken for a distress signal.

Art. 13. Nothing in these Rules shall interfere with the operation of any special Rules made by the Government of any nation with respect to additional station- and signal-lights for two or more ships of war, or for vessels sailing under convoy, or with the exhibition of recognition signals adopted by ship-owners, which have been authorized by their respective Governments and duly registered and published.

Art. 14. A steam-vessel proceeding under sail only, but having her funnel up, shall carry in daytime, forward, where it can best be seen one black ball or shape 2 feet in diameter.

Sound-Signals for Fog, &c.

Art. 15. All signals prescribed by this Article for vessels under way shall be given:

1. By "steam-vessels," on the whistle or siren.
2. By "sailing-vessels and vessels towed," on the fog-horn.

The words "prolonged blast" used in this Article shall mean a blast of from four to six seconds' duration.

A steam-vessel shall be provided with an efficient whistle or siren, sounded by steam, or some substitute for steam, so placed that the sound may not be intercepted by any obstruction, and with an efficient fog-horn, to be sounded by mechanical means, and also with an efficient bell.* A sailing-vessel of 20 tons gross tonnage or upwards shall be provided with a similar fog-horn and bell.

In fog, mist, falling snow, or heavy rain-storms, whether by day or night, the signals described in this Article shall be used as follows, viz.:—

(*a.*) A steam-vessel having way upon her shall sound, at intervals of not more than two minutes, a prolonged blast.

(*b.*) A steam-vessel under way, but stopped and having no way upon her, shall sound, at intervals of not more than two minutes, two prolonged blasts, with an interval of about one second between them

(*c.*) A sailing-vessel under way shall sound, at intervals of not more than one minute, when on the starboard tack, one blast, when on the port tack, two blasts in succession, and when with the wind abaft the beam, three blasts in succession.

(*d.*) A vessel when at anchor shall, at intervals of not more than one minute, ring the bell rapidly for about five seconds.

(*e.*) A vessel at anchor at sea, when not in ordinary anchorage ground, and when in such a position as to be an obstruction to vessels under way, shall sound, if a steam-vessel, at intervals of not more than two minutes, two prolonged blasts with her whistle or siren, followed by ringing her bell; or, if a sailing-vessel, at intervals of not more than one minute, two blasts with her fog-horn, followed by ringing her bell.

(*f.*) A vessel when towing shall, instead of the signals prescribed in subdivisions (*a*) and (*c*) of this Article, at intervals of not more than two minutes, sound three blasts in succession, viz., one prolonged blast followed by two short blasts. A vessel towed may give this signal, and she shall not give any other.

(*g.*) A steam-vessel wishing to indicate to another, "The way is off my vessel, you may feel your way past me," may sound three blasts in succession, viz., short, long, short, with intervals of about one second between them.

(*h.*) A vessel employed in laying or in picking up a telegraph cable shall, on hearing the fog-signal of an approaching vessel, sound in answer three prolonged blasts in succession.

(*i.*) A vessel under way which is unable to get out of the way of an approaching vessel through being not under command, or unable to manœuvre as required by these Rules, shall, on hearing the fog-signal of an approaching vessel, sound in answer four short blasts in succession.

Sailing-vessels and boats of less than 20 tons gross tonnage shall not be obliged to give the above-mentioned signals, but if they do not, they shall make some other efficient sound-signal at intervals of not more than one minute.

Speed of Ships to be Moderate in Fog, &c.

Art. 16. Every vessel shall, in a fog, mist, falling snow, or heavy rain-storms, go at a moderate speed, having careful regard to the existing circumstances and conditions.

A steam-vessel hearing, apparently forward of her beam, the fog-signal of a vessel the position of which is not ascertained, shall, so far as the circumstances of the case admit, stop her engines, and then navigate with caution until danger of collision is over.

Steering and Sailing Rules.

Preliminary.—Risk of Collision.

Risk of collision can, when circumstances permit, be ascertained by carefully watching the compass-bearing of an approaching vessel. If the bearing does not appreciably change, such risk should be deemed to exist.

* In all cases where the Rules require bell to be used a drum may be substituted on board Turkish vessels, or a gong where such articles are used on board small sea-going vessels.

Art. 17. When two sailing-vessels are approaching one another so as to involve risk of collision, one of them shall keep out of the way of the other as follows, viz.: –

(*a.*) A vessel which is running free shall keep out of the way of a vessel which is close-hauled.

(*b.*) A vessel which is close-hauled on the port tack shall keep out of the way of a vessel which is close-hauled on the starboard tack.

(*c.*) When both are running free, with the wind on different sides, the vessel which has the wind on the port side shall keep out of the way of the other.

(*d.*) When both are running free, with the wind on the same side, the vessel which is to windward shall keep out of the way of the vessel which is to leeward.

(*e.*) A vessel which has the wind aft shall keep out of the way of the other vessel.

Art. 18. When two steam-vessels are meeting end on, or nearly end on, so as to involve risk of collision, each shall alter her course to starboard, so that each may pass on the port side of the other.

This Article only applies to cases where vessels are meeting end on, or nearly end on, in such a manner as to involve risk of collision, and does not apply to two vessels which must, if both keep on their respective courses, pass clear of each other.

The only cases to which it does apply are when each of the two vessels is end on, or nearly end on, to the other; in other words, to cases in which, by day, each vessel sees the masts of the other in a line, or nearly in a line, with her own; and by night, to cases in which each vessel is in such a position as to see both the side-lights of the other.

It does not apply, by day, to cases in which a vessel sees another ahead crossing her own course; or by night, to cases where the red light of one vessel is opposed to the red light of the other, or where the green light of one vessel is opposed to the green light of the other, or where a red light without a green light, or a green light without a red light, is seen ahead, or where both green and red lights are seen anywhere but ahead.

Art. 19. When two steam-vessels are crossing, so as to involve risk of collision, the vessel which has the other on her own starboard side shall keep out of the way of the other.

Art. 20. When a steam-vessel and a sailing-vessel are proceeding in such directions as to involve risk of collision, the steam-vessel shall keep out of the way of the sailing-vessel.

Art. 21. Where by any of these Rules one of two vessels is to keep out of the way, the other shall keep her course and speed.

Art. 22. Every vessel which is directed by these Rules to keep out of the way of another vessel, shall, if the circumstances of the case admit, avoid crossing ahead of the other.

Art. 23. Every steam-vessel which is directed by these Rules to keep out of the way of another vessel shall, on approaching her, if necessary, slacken her speed or stop or reverse.

Art. 24. Notwithstanding anything contained in these Rules, every vessel overtaking any other shall keep out of the way of the overtaken vessel.

Every vessel coming up with another vessel from any direction more than two points abaft her beam, *i.e.*, in such a position, with reference to the vessel which she is overtaking that at night she would be unable to see either of that vessel's side-lights, shall be deemed to be an overtaking vessel; and no subsequent alteration of the bearing between the two vessels shall make the overtaking vessel a crossing vessel within the meaning of these Rules, or relieve her of the duty of keeping clear of the overtaken vessel until she is finally past and clear.

As by day the overtaking vessel cannot always know with certainty whether she is forward of or abaft this direction from the other vessel, she should, if in doubt, assume that she is an overtaking vessel and keep out of the way.

Art. 25. In narrow channels every steam-vessel shall, when it is safe and practicable, keep to that side of the fairway or mid-channel which lies on the starboard side of such vessel.

Art. 26. Sailing-vessels under way shall keep out of the way of sailing-vessels or boats fishing with nets, or lines, or trawls. This Rule shall not give to any vessel or boat engaged in fishing the right of obstructing a fairway used by vessels other than fishing-vessels or boats.

Art. 27. In obeying and construing these Rules due regard shall be had to all dangers of navigation and collision, and to any special circumstances which may render a departure from the above Rules necessary in order to avoid immediate danger.

Sound-Signals for Vessels in Sight of one another.

Art. 28. The words "short blast" used in this Article shall mean a blast of about one second's duration.

When vessels are in sight of one another, a steam-vessel under way, in taking any course authorized or required by these Rules, shall indicate that course by the following signals on her whistle or siren, viz.:—

One short blast to mean, "I am directing my course to starboard."

Two short blasts to mean, "I am directing my course to port."

Three short blasts to mean, "My engines are going full speed astern.

No Vessel, under any circumstances, to neglect proper Precautions.

Art. 29. Nothing in these Rules shall exonerate any vessel, or the owner, or master, or crew thereof, from the consequences of any neglect to carry lights or signals, or of any neglect to keep a proper look-out, or of the neglect of any precaution which may be required by the ordinary practice of seamen, or by the special circumstances of the case.

Reservation of Rules for Harbours and Inland Navigation.

Art. 30. Nothing in these Rules shall interfere with the operation of a special Rule, duly made by local authority, relative to the navigation of any harbour, river, or inland waters.

Distress Signals.

Art. 31. When a vessel is in distress and requires assistance from other vessels or from the shore, the following shall be the signals to be used or displayed by her, either together or separately, viz.:—

In the daytime—

1. A gun fired at intervals of about a minute;
2. The International Code signal of distress indicated by N C;
3. The distant signal, consisting of a square flag, having either above or below it a ball or anything resembling a ball;
4. Rockets or shells as prescribed below for use at night;
5. A continuous sounding with any fog-signal apparatus.

At night—

1. A gun fired at intervals of about a minute;
2. Flames on the vessel (as from a burning tar-barrel, oil-barrel, &c.);
3. Rockets or shells, bursting in the air with a loud report and throwing stars of any colour or description, fired one at a time at short intervals;
4. A continuous sounding with any fog-signal apparatus.

Appendix (B.)

The following Resolutions have been approved of by the Conference, and are recommended to the attention of the Powers represented thereat:—

1. The power of all lights should be expressed by referring them all to one standard, by which the light issuing from the lantern should be measured.
2. The minimum power only of each light should be definitely fixed, leaving it to the judgment of the parties responsible for fitting out the vessels with proper lanterns to employ lamps of this or greater power.
3. The use of incandescent lamps should be permitted; the use of arc lights at present should be excluded for all purposes other than signalling and searching.
4. Each lantern should be so constructed that the minimum power of light can be found at every point where the light is to be visible, after the lamp has been fitted with proper screens.
5. The lanterns should be so constructed as to insure the light having at least the required minimum power in the ideal line connecting the lantern with the horizon, even though the vessel be heeled one way or the other 10 degrees.
6. The colour of the glasses by which the colouring of the light is to be produced should be so chosen that, if possible, the red light shall have no admixture of green, nor the green light of red rays, and that both colours can be readily and unmistakably distinguished.
7. No detailed description should be internationally adopted for the construction of the lamp or lantern, so that a fair chance may be given to inventors to produce serviceable articles.
8. The side-lights should be so screened as to prevent the most convergent rays of the lights being seen across the bows more than half a point.
9. The side-lights should be placed in steam-vessels not forward of the mast-head light.
10. To meet the number of complaints as to the absence of proper lights on sailing-vessels, the attention of the Powers is called to the better enforcement of the Regulations in that behalf.
11. All steam-whistles, sirens, fog-horns, and bells should be thoroughly tested as to their efficiency, and should be capable of being heard at a stated minimum distance, and should be so regulated that the tones of whistles and sirens should be as distinct as possible from the sound of fog-horns.
12. Steam-vessels should be provided, if possible, with means of blowing off surplus steam when the engines are stopped, in such a manner as to occasion as little noise as possible.
13. In clear weather at sea no vessel should attempt to cross the bows of the leaders of any squadron of three or more ships of war in regular formation, nor unnecessarily to pass through the lines of such squadron.
14. In every case of collision between two vessels it should be the duty of the master or person in charge of each vessel, if and so far as he can do so without serious danger to his own vessel, crew, and passengers (if any), to stay by the other vessel until he has ascertained that she has no need of further assistance, and to render to the other vessel, her master, crew, and passengers (if any), such assistance as may be practicable and as may be necessary in order to save them from any danger caused by the collision, and also to give to the master or person in charge of the other vessel the name of his own vessel and her port of registry, or the port or place to which she belongs, and also the name of the ports and places from which, and to which, she is bound.

Inclosure 2.

Department of State, International Marine Conference,
Sir, *Washington, December* 31, 1889.

I HAVE the honour to inform you that the Conference, at a session held on the 30th December, 1889, upon motion of the First Delegate for France, passed the following Resolution :—

Resolved,—That a Final Act be printed showing for each division of the programme, and in the order of the divisions, the Resolutions adopted by the Conference.

This Act to be signed in the name of the Conference by the President and the Secretary.

In compliance with this Resolution I have the honour to transmit said Final Act.

Final Act.

The President of the United States of America, in pursuance of a special provision of Congress, having extended to the Governments of all maritime nations in diplomatic relations with his own an invitation to send Delegates to a Maritime Conference to meet in the city of Washington on the 16th October, 1889, to discuss, revise, and amend the Rules, Regulations, and practice concerning vessels at sea and navigation generally, this International Marine Conference assembled at the time and place designated, and, after careful and patient discussion and consideration of the entire programme, passes the following Resolutions upon the subjects contained under the various General Divisions :—

General Division I.

Marine Signals or other means of plainly indicating the Direction in which Vessels are moving in Fog, Mist, Falling Snow, and Thick Weather, and at Night.

Rules for the prevention of Collisions, and Rules of the Road.

1. Visibility, number, and position of lights to be carried by vessels.

   (*a.*) Steamers under way.
   (*b.*) Steamers towing.
   (*c.*) Vessels under way, but not under command, including steamers laying cable.
   (*d.*) Sailing-vessels under way.
   (*e.*) Sailing-vessels towing.
   (*f.*) Vessels at anchor.
   (*g.*) Pilot-vessels.
   (*h.*) Fishing-vessels.

2. Sound-signals ; their character, number, range, and position of instruments.

   (*a.*) For use in fog, mist, falling snow, and thick weather, as position signals.
      For steamers under way.
      For steamers towing.
      For sailing-vessels under way.
      For sailing-vessels towing.
         (These signals to show the approximate course steered if possible.)
      For vessels at anchor.
      For vessels under way, but not under command, including steamers laying cable.
   (*b.*) For use in all weathers as helm-signals only.
      For steamers meeting or crossing.
      For steamers overtaking.
      For steamers backing.
   (*c.*) Whether helm-signal shall be made compulsory or remain optional.

3. Steering and sailing rules.

(*a.*) Sailing-vessels meeting, crossing, overtaking, or being overtaken by each other.
(*b.*) Steamers meeting, crossing, overtaking, or being overtaken by each other.
(*c.*) Sailing-vessels meeting, crossing, overtaking, or being overtaken by steamers.
(*d.*) Steamers meeting, crossing, overtaking, or being overtaken by sailing-vessels.
(*e.*) Special Rules for channels and tide-ways, where no local Rules exist.
(*f.*) Conflict of international and local Rules.
(*g.*) Uniform system of commands to the helm.
(*h.*) Speed of vessels in thick weather.

Resolved,—That in the opinion of the Conference it is inexpedient to adopt course-indicating sound-signals in foggy or thick weather; inasmuch as among the other strong reasons presented by the Sound-Signal Committee, if such signals were used in crowded waters, danger would result from the uncertainty and confusion produced by a multiplicity of signals, and from the false security that would be created in the minds of mariners, and if vessels were navigated in dependence on such signals, when neither could see the other, there would be danger that the officer in charge might read the signal incorrectly, or, if he read it correctly, would interpret it wrongly.

Regulations for preventing Collisions at Sea.

Preliminary.

These Rules shall be followed by all vessels upon the high seas and in all waters connected therewith, navigable by sea-going vessels.

In the following Rules every steam-vessel which is under sail and not under steam is to be considered a sailing-vessel, and every vessel under steam, whether under sail or not, is to be considered a steam-vessel.

The word "steam-vessel" shall include any vessel propelled by machinery.

A vessel is "under way," within the meaning of these Rules, when she is not at anchor, or made fast to the shore, or aground.

Rules concerning Lights, &c.

The word "visible" in these Rules when applied to lights shall mean visible on a dark night with a clear atmosphere.

Article 1. The Rules concerning lights shall be complied with in all weathers from sunset to sunrise, and during such time no other lights which may be mistaken for the prescribed lights shall be exhibited.

Art. 2. A steam-vessel when under way shall carry—

(*a.*) On or in front of the foremast, or if a vessel without a foremast, then in the fore part of the vessel, at a height above the hull of not less than 20 feet, and if the breadth of the vessel exceeds 20 feet, then at a height above the hull not less than such breadth, so, however, that the light need not be carried at a greater height above the hull than 40 feet, a bright white light, so constructed as to show an unbroken light over an arc of the horizon of 20 points of the compass, so fixed as to throw the light 10 points on each side of the vessel, viz., from right ahead to 2 points abaft the beam on either side, and of such a character as to be visible at a distance of at least 5 miles.

(*b.*) On the starboard side a green light so constructed as to show an unbroken light over an arc of the horizon of 10 points of the compass, so fixed as to throw the light from right ahead to 2 points abaft the beam on the starboard side, and of such a character as to be visible at a distance of at least 2 miles.

(*c.*) On the port side a red light so constructed as to show an unbroken light over an arc of the horizon of 10 points of the compass, so fixed as to throw the light from right ahead to 2 points abaft the beam on the port side, and of such a character as to be visible at a distance of at least 2 miles.

(*d.*) The said green and red side-lights shall be fitted with inboard screens projecting at

least 3 feet forward from the light, so as to prevent these lights from being seen across the bow.

(*e.*) A steam-vessel when under way may carry an additional white light similar in construction to the light mentioned in subdivision (*a*). These two lights shall be so placed in line with the keel that one shall be at least 15 feet higher than the other, and in such a position with reference to each other that the lower light shall be forward of the upper one. The vertical distance between these lights shall be less than the horizontal distance.

Art. 3. A steam-vessel when towing another vessel shall, in addition to her side-lights, carry two bright white lights in a vertical line one over the other, not less than 6 feet apart, and when towing more than one vessel shall carry an additional bright white light 6 feet above or below such lights, if the length of the tow, measuring from the stern of the towing-vessel to the stern of the last vessel towed, exceeds 600 feet. Each of these lights shall be of the same construction and character, and shall be carried in the same position as the white light mentioned in Article 2 (*a*), excepting the additional light, which may be carried at a height of not less than 14 feet above the hull.

Such steam-vessel may carry a small white light abaft the funnel or aftermast for the vessel towed to steer by, but such light shall not be visible forward of the beam.

Art. 4.—(*a.*) A vessel which from any accident is not under command shall carry at the same height as the white light mentioned in Article 2 (*a*), where they can best be seen, and if a steam-vessel in lieu of that light, two red lights, in a vertical line one over the other, not less than 6 feet apart, and of such a character as to be visible all round the horizon at a distance of at least 2 miles; and shall by day carry in a vertical line one over the other, not less than 6 feet apart, where they can best be seen, two black balls or shapes, each 2 feet in diameter.

(*b.*) A vessel employed in laying or in picking up a telegraph cable shall carry in the same position as the white light mentioned in Article 2 (*a*), and if a steam-vessel in lieu of that light, three lights in a vertical line one over the other, not less than 6 feet apart. The highest and lowest of these lights shall be red, and the middle light shall be white, and they shall be of such a character as to be visible all round the horizon, at a distance of at least 2 miles. By day she shall carry in a vertical line one over the other, not less than 6 feet apart, where they can best be seen, three shapes not less than 2 feet in diameter, of which the highest and lowest shall be globular in shape and red in colour, and the middle one diamond in shape and white.

(*c.*) The vessels referred to in this Article, when not making way through the water, shall not carry the side-lights, but when making way shall carry them.

(*d.*) The lights and shapes required to be shown by this Article are to be taken by other vessels as signals that the vessel showing them is not under command, and cannot therefore get out of the way.

These signals are not signals of vessels in distress and requiring assistance. Such signals are contained in Article 31.

Art. 5. A sailing-vessel under way, and any vessel being towed, shall carry the same lights as are prescribed by Article 2 for a steam-vessel under way, with the exception of the white lights mentioned therein, which they shall never carry.

Art. 6. Whenever, as in the case of small vessels under way during bad weather, the green and red side-lights cannot be fixed, these lights shall be kept at hand, lighted and ready for use; and shall, on the approach of or to other vessels, be exhibited on their respective sides in sufficient time to prevent collision, in such manner as to make them most visible, and so that the green light shall not be seen on the port side nor the red light on the starboard side, nor if practicable more than 2 points abaft the beam on their respective sides.

To make the use of these portable lights more certain and easy, the lanterns containing them shall each be painted outside with the colour of the light they respectively contain, and shall be provided with proper screens.

Art. 7. Steam-vessels of less than 40, and vessels under oars or sails of less than 20 tons, gross tonnage, respectively, when under way, shall not be obliged to carry the lights mentioned in Article 2 (*a*), (*b*), and (*c*), but if they do not carry them they shall be provided with the following lights:—

1. Steam-vessels of less than 40 tons shall carry—

(*a.*) In the fore part of the vessel, or on or in front of the funnel, where it can best be seen, and at a height above the gunwale of not less than 9 feet, a bright white light constructed and fixed as prescribed in Article 2 (*a*), and of such a character as to be visible at a distance of at least 2 miles.

(*b.*) Green and red side-lights constructed and fixed as prescribed in Article 2 (*b*) and (*c*), and of such a character as to be visible at a distance of at least 1 mile, or a combined

lantern showing a green light and a red light from right ahead to 2 points abaft the beam on their respective sides. Such lantern shall be carried not less than 3 feet below the white light.

2. Small steam-boats, such as are carried by sea-going vessels, may carry the white light at a less height than 9 feet above the gunwale, but it shall be carried above the combined lantern mentioned in subdivision 1 (*b*).

3. Vessels under oars or sails, of less than 20 tons, shall have ready at hand a lantern with a green glass on one side and a red glass on the other, which, on the approach of or to other vessels, shall be exhibited in sufficient time to prevent collision, so that the green light shall not be seen on the port side, nor the red light on the starboard side.

The vessels referred to in this Article shall not be obliged to carry the lights prescribed by Article 4 (*a*), and Article 11, last paragraph.

Art. 8. Pilot-vessels when engaged on their station on pilotage duty shall not show the lights required for other vessels, but shall carry a white light at the masthead, visible all round the horizon, and shall also exhibit a flare-up light or flare-up lights at short intervals, which shall never exceed fifteen minutes.

On the near approach of or to other vessels they shall have their side-lights lighted, ready for use, and shall flash or show them at short intervals, to indicate the direction in which they are heading, but the green light shall not be shown on the port side, nor the red light on the starboard side.

A pilot-vessel of such a class as to be obliged to go alongside of a vessel to put a pilot on board may show the white light instead of carrying it at the masthead, and may, instead of the coloured lights above mentioned, have at hand ready for use a lantern with a green glass on the one side and a red glass on the other, to be used as prescribed above.

Pilot-vessels when not engaged on their station on pilotage duty shall carry lights similar to those of other vessels of their tonnage.

Art. 9. Fishing-vessels and fishing-boats when under way, and when not required by this Article to carry or show the lights therein named, shall carry or show the lights prescribed for vessels of their tonnage under way.

(*a.*) Vessels and boats when fishing with drift-nets shall exhibit two white lights from any part of the vessel where they can best be seen. Such lights shall be placed so that the vertical distance between them shall be not less than 6 feet and not more than 10 feet, and so that the horizontal distance between them, measured in a line with the keel, shall be not less than 5 feet and not more than 10 feet. The lower of these two lights shall be the more forward, and both of them shall be of such a character as to show all round the horizon, and to be visible at a distance of not less than 3 miles.

(*b.*) Vessels when engaged in trawling, by which is meant the dragging of an apparatus along the bottom of the sea—

1. If steam-vessels, shall carry in the same position as the white light mentioned in Article 2 (*a*) a tricoloured lantern so constructed and fixed as to show a white light from right ahead to 2 points on each bow, and a green light and a red light over an arc of the horizon from 2 points on either bow to 2 points abaft the beam on the starboard and port side respectively; and not less than 6 nor more than 12 feet below the tricoloured lantern, a white light in a lantern, so constructed as to show a clear, uniform, and unbroken light all round the horizon.

2. If sailing-vessels of 7 tons gross tonnage and upwards, shall carry a white light in a lantern, so constructed as to show a clear, uniform, and unbroken light all round the horizon, and shall also be provided with a sufficient supply of red pyrotechnic lights, which shall each burn for at least thirty seconds, and shall be shown on the approach of or to other vessels in sufficient time to prevent collision.

In the Mediterranean Sea, the vessels referred to in subdivision (*b*) 2 may use a flare-up light in lieu of a pyrotechnic light.

All lights mentioned in subdivision *b* (1) and (2) shall be visible at a distance of at least 2 miles.

3. If sailing-vessels of less than 7 tons gross tonnage, shall not be obliged to carry the white light mentioned in subdivision *b* (2) of this Article, but if they do not carry such light, they shall have at hand, ready for use, a lantern showing a bright white light, which shall, on the approach of or to other vessels, be exhibited where it can best be seen, in sufficient time to prevent collision; and they shall also show a red pyrotechnic light, as prescribed in subdivision *b* (2), or in lieu thereof a flare-up light.

(*c.*) Vessels and boats when line-fishing with their lines out and attached to their lines, and when not at anchor or stationary, shall carry the same lights as vessels fishing with drift-nets.

(*d.*) Fishing-vessels and fishing-boats may at any time use a flare-up light in addition to the lights which they are by this Article required to carry and show. All flare-up lights exhibited by a vessel when trawling or fishing with any kind of drag-net shall be shown at the after part of the vessel, excepting that, if the vessel is hanging by the stern to her fishing gear, they shall be exhibited from the bow.

(*e.*) Every fishing-vessel and every boat when at anchor shall exhibit a white light visible all round the horizon at a distance of at least 1 mile.

(*f.*) If a vessel or boat when fishing becomes stationary in consequence of her gear getting fast to a rock or other obstruction, she shall show the light and make the fog-signal prescribed for a vessel at anchor, respectively. (See Article 15 (*d*), (*e*), and last paragraph.)

(*g.*) In fog, mist, falling snow, or heavy rain-storms, drift-net vessels attached to their nets, and vessels when trawling, dredging, or fishing with any kind of drag-net, and vessels line-fishing with their lines out, shall, if of 20 tons gross tonnage or upwards, respectively, at intervals of not more than one minute, make a blast; if steam-vessels with the whistle or siren, and if sailing-vessels with the fog-horn, each blast to be followed by ringing the bell.

(*h.*) Sailing-vessels or boats fishing with nets or lines or trawls, when under way, shall in daytime indicate their occupation to an approaching vessel by displaying a basket or other efficient signal, where it can best be seen.

The vessels referred to in this Article shall not be obliged to carry the lights prescribed by Article 4 (*a*), and Article 11, last paragraph.

Art. 10. A vessel which is being overtaken by another shall show from her stern to such last-mentioned vessel a white light or a flare-up light.

The white light required to be shown by this Article may be fixed and carried in a lantern, but in such case the lantern shall be so constructed, fitted, and screened that it shall throw an unbroken light over an arc of the horizon of 12 points of the compass, viz., for 6 points from right aft on each side of the vessel, so as to be visible at a distance of at least 1 mile. Such light shall be carried as nearly as practicable on the same level as the side-lights.

Art. 11. A vessel under 150 feet in length, when at anchor, shall carry forward, where it can best be seen, but at a height not exceeding 20 feet above the hull, a white light in a lantern, so constructed as to show a clear, uniform, and unbroken light visible all round the horizon at a distance of at least 1 mile.

A vessel of 150 feet or upwards in length, when at anchor, shall carry in the forward part of the vessel, at a height of not less than 20 and not exceeding 40 feet above the hull, one such light, and at or near the stern of the vessel, and at such a height that it shall be not less than 15 feet lower than the forward light, another such light.

The length of a vessel shall be deemed to be the length appearing in her certificate of registry.

A vessel aground in or near a fairway shall carry the above light or lights and the two red lights prescribed by Article 4 (*a*).

Art. 12. Every vessel may, if necessary in order to attract attention, in addition to the lights which she is by these Rules required to carry, show a flare-up light or use any detonating signal that cannot be mistaken for a distress signal.

Art. 13. Nothing in these Rules shall interfere with the operation of any special Rules, made by the Government of any nation, with respect to additional station and signal-lights for two or more ships of war or for vessels sailing under convoy, or with the exhibition of recognition signals adopted by ship-owners, which have been authorized by their respective Governments and duly registered and published.

Art. 14. A steam-vessel proceeding under sail only, but having her funnel up, shall carry in daytime, forward, where it can best be seen, one black ball or shape 2 feet in diameter.

Sound-Signals for Fog, &c.

Art. 15. All signals prescribed by this Article for vessels under way shall be given—

1. By "steam-vessels" on the whistle or siren.
2. By "sailing-vessels and vessels towed" on the fog-horn.

The words "prolonged blast" used in this Article shall mean a blast of from four to six seconds' duration.

A steam-vessel shall be provided with an efficient whistle or siren, sounded by steam or some substitute for steam, so placed that the sound may not be intercepted by any

obstruction, and with an efficient fog-horn, to be sounded by mechanical means, and also with an efficient bell.* A sailing-vessel of 20 tons gross tonnage or upwards shall be provided with a similar fog-horn and bell.

In fog, mist, falling snow, or heavy rain-storms, whether by day or night, the signals described in this Article shall be used as follows, viz.:—

(*a.*) A steam-vessel having way upon her shall sound, at intervals of not more than two minutes, a prolonged blast.

(*b.*) A steam-vessel under way, but stopped and having no way upon her, shall sound, at intervals of not more than two minutes, two prolonged blasts, with an interval of about one second between them.

(*c.*) A sailing-vesel under way shall sound, at intervals of not more than one minute, when on the starboard tack one blast, when on the port tack two blasts in succession, and when with the wind abaft the beam three blasts in succession.

(*d.*) A vessel when at anchor shall, at intervals of not more than one minute, ring the bell rapidly for about five seconds.

(*e.*) A vessel, at anchor at sea, when not in ordinary anchorage ground and when in such a position as to be an obstruction to vessels under way, shall sound, if a steam-vessel, at intervals of not more than two minutes, two prolonged blasts with her whistle or siren, followed by ringing her bell; or, if a sailing-vessel, at intervals of not more than one minute, two blasts with her fog-horn, followed by ringing her bell.

(*f.*) A vessel, when towing, shall, instead of the signals prescribed in subdivisions (*a*) and (*c*) of this Article, at intervals of not more than two minutes, sound three blasts in succession, viz., one prolonged blast followed by two short blasts. A vessel towed may give this signal, and she shall not give any other.

(*g.*) A steam-vessel wishing to indicate to another "The way is off my vessel, you may feel your way past me," may sound three blasts in succession, viz., short, long, short, with intervals of about one second between them.

(*h.*) A vessel employed in laying or in picking up a telegraph cable shall, on hearing the fog-signal of an approaching vessel, sound in answer three prolonged blasts in succession.

(*i.*) A vessel under way, which is unable to get out of the way of an approaching vessel through being not under command, or unable to manœuvre as required by these Rules, shall, on hearing the fog-signal of an approaching vessel, sound in answer four short blasts in succession.

Sailing-vessels and boats of less than 20 tons gross tonnage shall not be obliged to give the above-mentioned signals, but if they do not, they shall make some other efficient sound-signal at intervals of not more than one minute.

Speed of Ships to be Moderate in Fog, &c.

Art. 16. Every vessel shall, in a fog, mist, falling snow, or heavy rain-storms, go at a moderate speed, having careful regard to the existing circumstances and conditions.

A steam-vessel hearing, apparently forward of her beam, the fog-signal of a vessel the position of which is not ascertained, shall, so far as the circumstances of the case admit, stop her engines, and then navigate with caution until danger of collision is over.

Steering and Sailing Rules.

Preliminary.—Risk of Collision.

Risk of collision can, when circumstances permit, be ascertained by carefully watching the compass bearing of an approaching vessel. If the bearing does not appreciably change, such risk should be deemed to exist.

Art. 17. When two sailing-vessels are approaching one another, so as to involve risk of collision, one of them shall keep out of the way of the other, as follows, viz.:—

(*a.*) A vessel which is running free shall keep out of the way of a vessel which is close-hauled.

* *Note.*—In all cases where the Rules require a bell to be used a drum may be substituted on board Turkish vessels, or a gong where such articles are used on board small sea-going vessels.

(*b.*) A vessel which is close-hauled on the port tack shall keep out of the way of a vessel which is close-hauled on the starboard tack.

(*c.*) When both are running free, with the wind on different sides, the vessel which has the wind on the port side shall keep out of the way of the other.

(*d.*) When both are running free, with the wind on the same side, the vessel which is to windward shall keep out of the way of the vessel which is to leeward.

(*e.*) A vessel which has the wind aft shall keep out of the way of the other vessel.

Art. 18. When two steam-vessels are meeting end on, or nearly end on, so as to involve risk of collision, each shall alter her course to starboard, so that each may pass on the port side of the other.

This Article only applies to cases where vessels are meeting end on, or nearly end on, in such a manner as to involve risk of collision, and does not apply to two vessels which must, if both keep on their respective courses, pass clear of each other.

The only cases to which it does apply are when each of the two vessels is end on, or nearly end on, to the other; in other words, to cases in which, by day, each vessel sees the masts of the other in a line, or nearly in a line, with her own; and by night, to cases in which each vessel is in such a position as to see both the side-lights of the other.

It does not apply, by day, to cases in which a vessel sees another ahead crossing her own course; or by night, to cases where the red light of one vessel is opposed to the red light of the other, or where the green light of one vessel is opposed to the green light of the other, or where a red light without a green light, or a green light without a red light, is seen ahead, or where both green and red lights are seen anywhere but ahead.

Art. 19. When two steam-vessels are crossing, so as to involve risk of collision, the vessel which has the other on her own starboard side shall keep out of the way of the other.

Art. 20. When a steam-vessel and a sailing-vessel are proceeding in such directions as to involve risk of collision, the steam-vessel shall keep out of the way of the sailing-vessel.

Art. 21. Where by any of these Rules one of two vessels is to keep out of the way, the other shall keep her course and speed.

Art. 22. Every vessel which is directed by these Rules to keep out of the way of another vessel shall, if the circumstances of the case admit, avoid crossing ahead of the other.

Art. 23. Every steam-vessel which is directed by these Rules to keep out of the way of another vessel shall, on approaching her, if necessary, slacken her speed or stop or reverse.

Art. 24. Notwithstanding anything contained in these Rules, every vessel overtaking any other shall keep out of the way of the overtaken vessel.

Every vessel coming up with another vessel from any direction more than 2 points abaft her beam, *i.e.*, in such a position, with reference to the vessel which she is overtaking that at night she would be unable to see either of that vessel's side-lights, shall be deemed to be an overtaking vessel; and no subsequent alteration of the bearing between the two vessels shall make the overtaking vessel a crossing vessel within the meaning of these Rules, or relieve her of the duty of keeping clear of the overtaken vessel until she is finally past and clear.

As by day the overtaking vessel cannot always know with certainty whether she is forward of or abaft this direction from the other vessel she should, if in doubt, assume that she is an overtaking vessel and keep out of the way.

Art. 25. In narrow channels every steam-vessel shall, when it is safe and practicable, keep to that side of the fairway or mid-channel which lies on the starboard side of such vessel.

Art. 26. Sailing-vessels under way shall keep out of the way of sailing-vessels or boats fishing with nets, or lines, or trawls. This Rule shall not give to any vessel or boat engaged in fishing the right of obstructing a fairway used by vessels other than fishing-vessels or boats.

Art. 27. In obeying and construing these Rules due regard shall be had to all dangers of navigation and collision, and to any special circumstances which may render a departure from the above Rules necessary in order to avoid immediate danger.

Sound-Signals for Vessels in sight of one another.

Art. 28. The words "short blast" used in this Article shall mean a blast of about one second's duration.

When vessels are in sight of one another, a steam-vessel under way, in taking any course authorized or required by these Rules, shall indicate that course by the following signals on her whistle or siren, viz. :—

One short blast to mean, "I am directing my course to starboard."

Two short blasts to mean, "I am directing my course to port."

Three short blasts to mean, "My engines are going full speed astern."

No Vessel, under any circumstances, to neglect proper Precautions.

Art. 29. Nothing in these Rules shall exonerate any vessel, or the owner, or master, or crew thereof, from the consequences of any neglect to carry lights or signals, or of any neglect to keep a proper look-out, or of the neglect of any precaution which may be required by the ordinary practice of seamen, or by the special circumstances of the case.

Reservation of Rules for Harbours and Inland Navigation.

Art. 30. Nothing in these Rules shall interfere with the operation of a special Rule, duly made by local authority, relative to the navigation of any harbour, river, or inland waters.

Distress Signals.

Art. 31. When a vessel is in distress and requires assistance from other vessels or from the shore, the following shall be the signals to be used or displayed by her, either together or separately, viz. :—

In the daytime—

1. A gun fired at intervals of about a minute;
2. The International Code signal of distress indicated by NC;
3. The distant signal, consisting of a square flag, having either above or below it a ball or anything a resembling a ball;
4. Rockets or shells as prescribed below for use at night;
5. A continuous sounding with any fog-signal apparatus.

At night—

1. A gun fired at intervals of about a minute;
2. Flames on the vessel (as from a burning tar-barrel, oil-barrel, &c.);
3. Rockets or shells, bursting in the air with a loud report and throwing stars of any colour or description, fired one at a time at short intervals;
4. A continuous sounding with any fog-signal apparatus.

The following Resolutions have been approved of by the Conference, and are recommended to the attention of the Powers represented thereat in an Appendix to Rules of the Road :—

1. The power of all lights should be expressed by referring them all to one standard, by which the light issuing from the lantern should be measured.
2. The minimum power only of each light should be definitely fixed, leaving it to the judgment of the parties responsible for fitting out the vessels with proper lanterns to employ lamps of this or greater power.
3. The use of incandescent lamps should be permitted; the use of arc lights, at present, should be excluded for all purposes other than signalling and searching.
4. Each lantern should be so constructed that the minimum power of light can be found at every point where the light is to be visible after the lamp has been fitted with proper screens.
5. The lanterns should be so constructed as to insure the light having, at least, the required minimum power in the ideal line connecting the lantern with the horizon, even though the vessel be heeled one way or the other 10 degrees.
6. The colour of the glasses by which the colouring of the light is to be produced should be so chosen that, if possible, the red light shall have no admixture of green, nor the green light of red rays, and that both colours can be readily and unmistakably distinguished.
7. No detailed description should be internationally adopted for the construction of the lamp or lantern, so that a fair chance may be given to inventors to produce serviceable articles.
8. The side-lights should be so screened as to prevent the most convergent rays of the light being seen across the bows more than half a point.

9. The side-lights should be placed, in steam-vessels, not forward of the masthead-light.

10. To meet the number of complaints as to the absence of proper lights on sailing-vessels, the attention of the Powers is called to the better enforcement of the Regulations in that behalf.

11. All steam-whistles, sirens, fog-horns, and bells should be thoroughly tested as to their efficiency, and should be capable of being heard at a stated minimum distance, and should be so regulated that the tones of whistles and sirens should be as distinct as possible from the sound of fog-horns.

12. Steam-vessels should be provided, if possible, with means of blowing off surplus steam when the engines are stopped, in such a manner as to occasion as little noise as possible.

13. In clear weather at sea no vessel should attempt to cross the bows of the leaders of any squadron of three or more ships of war in regular formation, nor unnecessarily to pass through the lines of such squadron.

14. In every case of collision between two vessels it should be the duty of the master or person in charge of each vessel, if and so far as he can do so without serious danger to his own vessel, crew, and passengers (if any), to stay by the other vessel until he has ascertained that she has no need of further assistance, and to render to the other vessel, her master, crew, and passengers (if any), such assistance as may be practicable and as may be necessary in order to save them from any danger caused by the collision, and also to give to the master or person in charge of the other vessel the name of his own vessel, and her port of registry, or the port or place to which she belongs, and also the name of the ports and places from which and to which she is bound.

General Division II.

Regulations to determine the Seaworthiness of Vessels.

(*a.*) Construction of vessels.
(*b.*) Equipment of vessels.
(*c.*) Discipline of crew.
(*d.*) Sufficiency of crew.
(*e.*) Inspection of vessels.
(*f.*) Uniform certificates of inspection.

1. It is the opinion of the Conference that, upon the subjects contained in the sections of this Division no International Rule could be made which would secure beneficial results. It is thought that the Conference would be limited in each case to a recommendation fixing a minimum for the objects which it is desired to secure under each of these sections. If such a minimum were made the legal requirement it would have an injurious effect upon the present standard of efficiency in many countries.

2. In other countries where such efficiency does not exist, it is thought that it will be best secured by the same means which have secured it elsewhere, leaving each nation to modify such means in ways which will best adapt them to the particular methods of the respective Governments.

3. Again, it is found that the present Rules existing in different countries upon several of these questions are different in many respects, though probably equally efficient. It would, therefore, become necessary, in forming an International Rule in such cases, to recommend changes in the existing Rules of several countries, which to some of them might be impracticable. This is thought to be undesirable. However, the Conference earnestly recommend that—

4. All vessels, whether propelled by steam or sail, should possess a margin of strength over and above that which is required to enable them to perform the work for which they were designed and built. A chain, a bridge, or any other structure, the failure of which would entail the loss of human life, invariably has a considerable reserve of strength provided; in other words, the admitted working load is always much less than the computed strength, or the strength ascertained by actual test; certainly, it is no less important that the hull of a vessel should contain a similar reserve.

5. To attempt to formulate Rules for the construction of vessels of all sizes and for all trades would far exceed the province of this Conference; and, besides, any

arbitrary Rules would probably much hamper the advance in design and the method of construction.

6. Therefore, to obtain as much as seems to be practicable in this direction, it is desirable to rely upon efficient and oft-repeated inspection, when, upon the least indication of distress or of rupture showing, very substantial additions should be made before the vessel is allowed to again proceed to sea.

7. Ocean-going steam-vessels which carry passengers should be additionally protected by having efficient bulkheads, so spaced that when any two compartments be filled with water, the vessels will still remain in a seaworthy condition, and two, at least, of the amidships bulkheads should be tested by water-pressure to the height of the deck next above the water-line.

General Division III.

Draft to which Vessels should be restricted when loaded.

"Uniform maximum load-mark."

The Conference are led to believe that notwithstanding the advantages which would be connected with the introduction of a uniform system of load-marks, this matter is not ripe for consideration by this Conference, and that it ought to be left to the negotiations to be carried on between the Governments of the maritime nations.

General Division IV.

Uniform Regulations regarding the Designating and Marking of Vessels.

(*a.*) Position of name on vessels.
(*b.*) Position of name of port of registry on vessels.
(*c.*) Size of lettering.
(*d.*) Uniform system of draught-marks.

1. The name of every registered merchant-vessel shall be marked upon each bow and upon the stern, and the port of registry of every such vessel shall be marked upon the stern.

These names shall be marked in Roman letters in a light colour on a dark ground, or in a dark colour on a light ground, and to be distinctly visible.

The smallest letters used shall not be less than 4 inches high.

2. The draught of every registered vessels hall be marked upon the stern and stern-post in English feet or decimeteres, in either Arabic or Roman numerals. The bottom of each numeral shall indicate the draft to that line.

General Division V.

Saving Life and Property from Shipwreck.

1. Saving of life and property from shipwreck at sea.
(*a.*) Duties of vessels after collision.
(*b.*) Apparatus for life saving to be carried on board ship. (Life-boats, life-preservers, life-rafts, pumps, and fire-extinguishing apparatus.)
(*c.*) The use of oil and the necessary apparatus for its use.
(*d.*) Uniform inspections as to (*b*) and (*c*).
2. Saving of life and property from shipwreck by operations from shore.
(*a.*) Organization of, and methods employed by, life-saving institutions.
(*b.*) The employment of drilled and disciplined crews at life-saving stations.
(*c.*) The maintenance of a patrol upon dangerous coasts by night, and during thick

weather by day, for warning off vessels standing into danger, and for the early discovery of wrecks.

(*d.*) Uniform means of transmitting information between stranded vessels and the shore.

(*e.*) Life-boats, life-saving apparatus and appliances.

3. Official inquiries into causes and circumstances of shipwrecks and other casualties.

(1.) *Resolved*,—In every case of collision between two vessels, it shall be the duty of the master or person in charge of each vessel, if and so far as he can do so without danger to his own vessel, crew, and passengers (if any), to stay by the other vessel until he has ascertained that she has no need of further assistance, and to render to the other vessel, her master, crew, and passengers (if any), such assistance as may be practicable, and as may be necessary in order to save them from any danger caused by the collision; and also to give to the master or person in charge of the other vessel the name of his own vessel, and of her port of registry, or of the port or place to which she belongs, and also the names of the ports and places from which and to which she is bound.

(2.) *Resolved*,—That the Conference approve of the principle of the Rules made by the Board of Trade of Great Britain under "The Merchant Shipping (Life-Saving Appliances) Act, 1888," relating to boats and appliances to be carried on board ship for saving life; and recommend that the several Governments adopt measures to secure compliance with this principle in regard to such boats and appliances for vessels of 150 tons and upwards gross tonnage.

It is also recommended that the principle of these Rules be extended to all smaller craft, as far as practicable; and that each vessel of this class should carry at least one life-buoy of approved pattern and material, and for every person on board an efficient life-belt or jacket.

(3.) *Resolved*,—That the Conference recommend that the several Governments require all their sea-going vessels to carry a sufficient quantity of animal or vegetable oil, for the purpose of calming the sea in rough weather, together with suitable means for applying it.

(4.) *Resolved*,—That the Conference recommend that all institutions for saving life from wrecked vessels prepare uniform instructions to mariners with reference to their co-operation with those attempting their rescue from the shore, and that said instructions include the following signals:—

Upon the discovery of a wreck by night the life-saving force will burn a red pyrotechnic light or a red rocket to signify "You are seen; assistance will be given as soon as possible."

A red flag waved on shore by day, or a red light, red rocket, or red Roman candle displayed by night will signify "Haul away."

A white flag waved on shore by day, or a white light slowly swung back and forth, or a white rocket or white Roman candle fired by night, will signify "Slack away."

Two flags, a white and a red, waved at the same time on shore by day, or two lights, a white and a red, slowly swung at the same time, or a blue pyrotechnic light burned by night, will signify "Do not attempt to land in your own boats. It is impossible."

A man on shore beckoning, by day, or two torches burning near together, by night, will signify "This is the best place to land."

Any of these signals may be answered from the vessel as follows: In the daytime by waving a flag, a handkerchief, a hat, or even the hand; at night by firing a rocket, a blue light or a gun, or by showing a light over the ship's gunwale for a short time and then concealing it.

And it is recommended that the several Governments take measures to keep all their sea-going vessels supplied with copies of such instructions.

6. *Resolved*,—That the Conference recommend that the several nations provide by legislative enactments for official inquiry into the causes and circumstances of all shipwrecks and other serious casualties happening to their vessels.

General Division VI.

Necessary Qualifications for Officers and Seamen, including Tests for Sight and Colour Blindness.

(*a.*) A uniform system of examination for the different grades.
(*b.*) Uniform tests for visual power and colour-blindness.
(*c.*) General knowledge of methods employed at life-saving stations.
(*d.*) Uniform certificates of qualification.

1. Every man or boy going to sea as a seaman, or with the intention of becoming a seaman, should be examined for visual power and colour-blindness; and no man or boy should be permitted to serve on board any vessel in the capacity of seaman, or where he will have to stand look-out, whose visual power is below one-half normal, or who is red and green colour-blind.

2. Every man who shall qualify as an officer or as a pilot of a registered vessel after the adoption of these Rules, except engineer officers, shall be required to have a certificate that he has the necessary visual power, and that he is not red and green blind. He shall also have a certificate that he is familiar with the Regulations for preventing collisions at sea, and with the duties required of him in co-operating with a life-saving station in case his vessel is stranded.

3. It is recommended that each country provide means which will enable any boy or man intending to go to sea to have his eyes examined for visual power and colour-blindness, and to obtain a certificate of the result, also to enable the master of any vessel to have the eyes of any of his crew tested for the same purpose.

It is the opinion of the Conference that defective visual power and colour-blindness are sources of danger at sea. The first both by day and night, because of the inability of the short-sighted to see objects at a sufficient distance. Colour-blindness is a source of danger, more especially at night, because of the inability of a colour-blind person to distinguish between the red and green side-lights. The inability on the part of an officer or look-out to distinguish the colour of buoys may be a cause of accident in broad daylight.

It is the opinion of the Conference, however, that tests for these defects need not be enforced in the cases of masters and mates who already occcupy such positions.

The Conference purposely avoid making any recommendation as to the methods to be used in making such tests for visual power and colour-blindness, or in conducting the necessary examinations for officers. It is thought that the desired objects will be best secured by leaving each country to employ the methods which may seem most suitable.

General Division VII.

Lanes for Steamers on frequented Routes.

(*a.*) With regard to the avoidance of steamer collisions.
(*b.*) With regard to the safety of fishermen.

After consideration of various routes the Conference concluded to report only upon the North Atlantic route between ports of North America and ports of Northern Europe as the route upon which there was apparently the greater demand for such lanes, if such could be advantageously laid down on any ocean or sea.

It appears that the adherence of fast steam passenger-vessels to certain southerly routes would tend to the avoidance of fog and ice, and the Conference adopted a Resolution to the effect that it was desirable during the spring and summer months that such vessels should follow a southern route which would clear the Banks of Newfoundland, and be likely to be clear of fog and ice, but when it came to proposing any plan to make such ocean lanes compulsory, the Conference found the subject one of such difficulty that they do not recommend a proposition of that nature.

The difficulty of enforcing the present Rule providing for moderate speed in thick weather suggests what greater difficulties would be met with in enforcing lane routes if made compulsory, and it was not thought desirable to lay down routes by international agreement unless they were to be made compulsory for swift steamers.

Routes that might be proposed would be in danger of invasion by ice during the spring and summer months, and at all times would be crossed by sailing-vessels and

steamers going north and south. If laid down on parallels of latitude which seemed to favour one seaport at the expense of another, or the ports of one country at the expense of the ports of another country, they would arouse opposition that would probably prevent their adoption.

It is possible that even in the near future vesels may be employed of such power and speed that all such considerations may have to give way to the paramount consideration of safety, but, so far as shown to the Conference, present conditions do not seem to justify an international agreement to that effect. It was not shown to the Conference that collisions in mid-ocean between fast ocean steamers had taken place, or that the danger was great enough to justify enforced adherence to certain lanes. Collisions between fast steam-ships, so far, have occurred nearer the coasts where all tracks must converge.

The Conference believe, however, that the voluntary establishment of, and adherence to, particular routes by the different Steam-ship Companies, for different seasons of the year, is very desirable. In fact, the Conference are of the opinion that such action by the Steam-ship Companies, with the experience to be gained thereby, would be quite essential before any concerted action by the Maritime Powers could be profitably taken.

The Conference therefore strongly recommend that the Companies interested should, by mutual agreement, after consultation together, establish routes for the different lines, and make them public, in order that the Hydrographic Offices of the various Governments may publish them for the information of navigators.

The Conference have considered the opinions of several persons in the printed matter that has been laid before them. With the exception of one or two definite propositions, the literature before the Conference does not show how such lane routes could be laid down. Even those containing such propositions arrive at the conclusion that such routes could not be made compulsory.

With regard to the safety of fishermen upon the North Atlantic Ocean, the Conference are of opinion that their safety would be best promoted by unceasing vigilance on the part of the fishermen, and by careful compliance by all with the present Rules for the prevention of collisions, especially as to the efficiency of lights and sound-signals. If lanes were established which carried the fast steamers clear of the Banks frequented by the fishermen it might promote such a sense of security on their part as would tend to carelessness with reference to the Rules as at present laid down, and lead to danger from the slower vessels which would still frequent the Banks.

During the months when the fishing-vessels most frequent the Banks the fear of encountering fog and ice leads many of the steamers to go south of them.

Quick passages are what the steam-vessels aim at in response to the public demand for swift passenger and mail service, and if they were compelled to obey existing Rules regarding moderate speed in fogs at all times and in all places they would avoid the Banks still more in order to go clear of fogs; and thus it seems that the solution of the problem before the Conference, namely, of how to induce steam-ships of great speed to take safer routes to avoid fogs, ice, and danger of collision with fishermen and other vessels, is in compelling obedience to the present Rules regarding moderate speed in thick weather. The enforcement of these Rules would make it for the interest of such vessels to take routes comparatively clear of fogs and ice, and thus attain the end which compulsory legislation might fail to do.

From the correspondence placed before the Conference regarding the dangers of fishermen upon the Banks, it will be observed that vigilance regarding lights and sound-signals have been found efficient safeguards in most instances.

General Division VIII.

Night Signals for communicating Information at Sea.

(*a.*) A Code to be used in connection with the International Code Signal Book.

(*b.*) Or a Supplementary Code of limited scope to convey information of special mportance to passing vessels.

(*c.*) Distress signals.

With regard to subsections (*a*) and (*b*) of General Division VIII, the Conference have considered systems of night-signals with ordinary coloured lights, but the objection exists that they cannot be seen so far as a white light. It is the opinion of the Conference

that night-signalling at sea can better be carried on by a system of long and short flashes from a white light than by any system in which coloured lights are used.

The Conference have concluded that the systems of signalling by pyrotechnic lights which have been brought to their notice are too expensive for general use.

The Conference have had before them "a Supplementary Code of limited scope to convey information of special importance to passing vessels," which has been prepared by a Committee of the British Board of Trade, and has been presented by the British Government to the various Powers for their consideration.

The Conference, after careful consideration, recommend the adoption, for optional use, of that Supplementary Code, with the following change: To strike out signal PG, "Beware of derelict dangerous to navigation," and substitute in its place NP, "I want assistance. Remain by me."

The Conference decided upon the following fog-signals, to be allotted to pilots and to vessels seeking pilots:—

For vessels requiring pilots—a prolonged blast followed by a short blast, ——— —.

For pilots wishing to offer their services—short blast followed by a long blast, — ———.

And the Conference recommend that they be inserted in the International Code Book under the Pilot-Signals.

The Conference suggest that the complete alphabet of the Morse Code be inserted in the International Code Book for optional use.

General Division IX.

Warnings of approaching Storms.

(*a.*) The transmission of warnings.
(*b.*) The uniformity of signals employed.

The preparation of weather forecasts and the transmission of warnings regarding expected storms must, by the very nature of the subject, be dealt with locally; and it is in the opinion of the Conference very questionable whether any useful purpose would be gained by the adoption of uniformity of methods, except so far as the general progress of scientific knowledge indicates the direction of possible improvement; and this, it is hardly necessary to say, is more likely to be secured by work carried on independently rather than under any uniform system.

The Conference invite the maritime countries interested to take into consideration the establishment of a uniform system of indicating storm warnings by day and by night, and that such a system should, as far as possible, include signals indicating whether the storm is approaching or has passed the station.

General Division X.

Reporting, marking, and removing Dangerous Wrecks or Obstructions to Navigation.

(*a.*) A uniform method of reporting and marking dangerous wrecks and derelicts.

(*b.*) The division of the labour, cost, and responsiblity among the several maritime nations, either by geographical apportionment or otherwise:—

Of the removal of dangerous derelicts;

And of searching for doubtful dangers with a view of removing them from the charts.

Resolutions submitted for the consideration of the Powers.

1. That it is advisable to make it the duty of any of the officers or of the crew of a wreck or derelict to report, as soon as possible after landing, to the nearest harbour authority, if necessary through their Consul, as follows:—

(*a.*) Name of the vessel abandoned.

(*b.*) Her distinguishing number.

(*c.*) Name of her home port, port from which she sailed, and place of destination.

(*d.*) General description of vessel and her rig.

(*e.*) Place where abandoned (latitude and longitude as near as possible).

(*f.*) Weather and current experienced before leaving the vessel, and in case she was a derelict, the direction in which she would most likely drift.

(*g.*) Whether or not it is intended to take any steps toward her recovery.

2. That a similar report should be made to the same authorities by the master of an vessel sighting a wreck or derelict, and a suitable entry made in the ship's log.

3. That such reports should be published in "Notices to Mariners," the daily press, and, if necessary, by giving telegraphic information to the ports which it most concerns.

4. That it is advisable to make it the duty of every commander or master of a vessel to report the fact that an iceberg or dangerous field ice has been sighted, or a shoal, reef, or other obstruction has been discovered, to the harbour authorities or the Hydrographic Office of that country to which the port next reached belongs, giving a full description of the obstruction, and all facts that may lead to the determination of its position; for instance, the time elapsed since the last reliable astronomical observation, and the rate of the chronometer. If the obstruction be a shoal or reef, the depth of water actually obtained by sounding on it should be given. Also, when land is in sight, the position of any off-lying shoal or reef should be determined by compass bearings of fixed objects in view; the error of the compass being stated, with information as to how and when that error was observed. Angles should also be taken between such objects, and a drawing of the coast and the position of the observer be added.

5. That whenever practicable it shall be the duty of the crew before abandoning a vessel (*a*) to hoist some distinctive signal, as: BCF, "Abandoned by the crew," or CRTG, "Derelict," or a ball, shape, or other similar mark, where it can best be seen, and where it should not be mistaken for any other authorized signal; (*b*) to let go the sheets and halliards of such sails as are not furled.

6. That the different Maritime Powers interested in the navigation of that portion of the North Atlantic Ocean bordering the American coast, and situated westward of a line drawn from the Bermuda Islands to Cape Race, Newfoundland, be invited to come to an agreement respecting the removal of derelicts in these waters under due official supervision.

7. That in countries which, by Treaty, have acknowledged the exterritoriality of subjects of other Powers and their property, the Consul or Consuls concerned shall be instructed not to withhold his or their consent to the destruction of a wreck or parts thereof, if it is shown that the wreck constitutes a danger to passing vessels, and if there is no apparent possibility that it will be removed within a reasonable time by the owners or the Insurance Companies interested.

General Division XI

Notice of Dangers to Navigation.

Notice of Changes in Lights, Buoys, and other Day and Night Marks.

(*a.*) A uniform method of taking bearings, of designating them (whether true or magnetic), and of reporting them.

(*b.*) A uniform method of reporting, indicating, and exchanging information by the several maritime nations, to include the form of "Notices to Mariners."

(*c.*) A uniform method of distributing this information.

The Conference invite the several Maritime Powers to consider the following Resolutions, with a view to establishing uniformity in the subjects treated in "Notices to Mariners" and "Light Lists":—

1. That all bearings should be given from seaward.

2. That the bearings of cuts of different coloured sectors of lights or bearings of lights defining a narrow channel should be expressed in degrees where practicable.

3. That all bearings expressed in degrees should count from north and south, from 0° to 90°, towards east and west.

4. That in designating bearings the letter E shall designate east and the letter W shall designate west.

5. That whenever bearings are given the variation of the compass at the place should be stated.

6. That distances should be expressed in nautical miles and fractions thereof. The word "cable" should mean the tenth part of a nautical mile.

7. That whenever the longitude of a position is given, it should be stated which prime meridian is adopted, and if other than that of Greenwich or Paris, the difference of longitude should also be stated.

8. That in defining the visibility of a light it should be stated whether the distance is for "clear" or "mean" state of the weather.

9. That where the geographical range of a light is given it should be calculated as seen at high water from an observer 15 feet, or 5 metres, above the sea.

10. That a uniform classification of lights, based on luminous intensity and on the character as seen by the mariner, should be adopted.

11. That the Central Offices that issue "Notices to Mariners" or "Light Lists" should be permitted to correspond direct on such subjects.

12. That from countries where "Notices to Mariners" are published only in newspapers, copies of such papers should be sent to the various Hydrographic Offices.

General Division XII.

A uniform System of Buoys and Beacons.

(*a.*) Uniformity in colour of buoys.
(*b.*) Uniformity in numbering of buoys.

On the principle of using four colours to mark the four sides of a shoal, the Conference put forward the following scheme, based on the least change that would be necessary in altering the present systems to a uniform plan, and they bring it to the notice of the countries interested as an example showing that uniformity is attainable if they will agree to consider the subject.

All shoals marked on the compass system to be marked—
On the *North* side by a single Black or White colour.
South side by Red.
East side by half Red and half White combined.
West side by half White and half Black combined.

On Rocks in Fairway, with channels on either hand, to be marked Black or Red, with horizontal bands.

If such colours were adopted, then the following changes of colour would be necessary :—

The marks on the *North* side of a shoal would remain coloured Black or White as they now are in all countries using the compass system.

The marks on the *South* side of a shoal would in—
Norway, have to be changed from White to Red.

The marks on the *East* side of a shoal would in—

Norway,	have to be changed from	Black	to half Red and half White.
Sweden,	do.	Black and White	do.
Denmark,	do.	Red	do.

The marks on the *West* side of a shoal would in—

Norway, Denmark,	have to be changed from	White	to half White and half Black.
Sweden,	do.	Red	do.
Finland,	do.	White and Red	do.

The marks on a rock in Fairway, with channel on either side, if a white horizontal band is generally adopted, would in Russia have to be changed from Black to Black or Red with White horizontal bands, in agreement with the other countries.

The Conference invite the various Powers interested to consider the following general principles, which they put forward as a basis on which to build up a uniform international buoyage system for districts other than those where the compass system is in use.

The term "starboard-hand" shall denote that side of a navigable channel which is on the right hand of the mariner entering from seaward; the term "port-hand" shall denote that side which is on the left hand under the same circumstances.

Colour.—Buoys defining the starboard-hand shall be painted a single red colour.

Buoys defining the port-hand shall be painted a single black colour, or a parti-colour.

Buoys defining middle grounds shall be painted with horizontal bands.

Form.—Wherever form is used as a distinctive character—

Buoys defining the starboard-hand shall be conical, and those defining the port-hand shall be can or spar.

Top Marks.—Countries where form is not used as a distinctive character for buoys may adopt as another distinctive feature for the buoys on either side of a channel, top-marks resembling a cone to be used on the starboard side, or a cylinder on the port side of a channel.

Numbers and Letters.—Numbers, letters, and names may be painted on the buoys, but they must never be so large as to interfere with their distinctive colouring.

Wherever numbers and letters are used they shall be in consecutive order, commencing from seaward.

Buoying and marking of Wrecks.—(*a.*) All buoys and the top-sides of vessels used for the marking of wrecks, shall be painted green with a suitable white inscription.

(*b.*) Where it is practicable, by day one ball shall be exhibited on the side of the vessel nearest the wreck, and two placed vertically on the other side; three fixed white lights similarly arranged, but not the ordinary riding light, shall be shown from sunset to sunrise.

General Division XIII.

The Establishment of a Permanent International Maritime Commission

(*a.*) The composition of the Commission.
(*b.*) Its powers and authority.

Resolved,—That for the present the establishment of a Permanent International Maritime Commission is not considered expedient.

On the 31st December, the programme having been completed, the following Resolutions were adopted:—

On motion of Mr. Hall (Great Britain):

Resolved,—That a cordial vote of thanks be tendered by the Conference to its President, Rear-Admiral Samuel R. Franklin, for his courteous, impartial, and able conduct in the chair.

On motion of Dr. Sieveking (Germany):

Resolved,—That the thanks of the Conference be expressed to the Secretaries of the Conference and to the officers detailed by the United States' Government, for their assiduous services and the valuable assistance given by them to the works of the Conference.

On motion of Captain Richard (France):

That the names of the various Secretaries, given herewith, be added to the Resolution of Dr. Sieveking:—

Lieutenant Vincendon L. Cottman, Mr. Cecil A. Spring Rice, M. Walter Blaess, M. Charles Ribière, Permanent Secretaries;

Lieutenant Frank E. Beatty, Lieutenant Edward D. Bostick, Lieutenant Ridgely Hunt, Lieutenant John F. Newton, Ensign William L. Howard, Secretaries to Committees.

The Conference recommend that a copy of this Final Act be transmitted to the various Powers represented.

In the name of the International Marine Conference,

I am, &c.

(Signed) S. R. FRANKLIN, *Rear-Admiral, United States' Navy, President.*

(Signed) V. L. Cottman,
Lieutenant, United States' Navy, Secretary.

Hon. James G. Blaine, Secretary of State,
Department of State.

TABLE OF CONTENTS.

No.	Name.	Date.	Subject.	Page
1	Sir L. West	Feb. 24, 1888	Reports Senate having voted expenses of Maritime Conference, and indicates its scope and object	1
2	To Board of Trade ..	Mar. 7,	Forwards above	1
3	Board of Trade	20,	Premature to consider question of representation of Her Majesty's Government. Great Britain has hitherto taken the initiative in these matters	2
4	To Sir L. West	27,	Sends copy of above	2
5	„ „	June 13,	What further steps have been taken with regard to proposed Maritime Conference?	2
6	To Board of Trade ..	13,	Informs of above, and of information communicated to Lloyd's	3
7	Mr. Edwardes	July 13,	Act has been signed by President. Copies of Law will be sent in due course	3
8	Sir L. West	20,	Sends copy of Act of Congress	3
9	Mr. Phelps	Aug. 14,	Sends note from his Government explaining scope and object of Conference, and inviting Her Majesty's Government to be represented thereat	4
10	To Board of Trade ..	17,	Sends above, for opinion as to reply which should be returned	6
11	Board of Trade	28,	Matter will be considered. What were the suggestions made in conversation with American Minister?	7
12	To Count Hatzfeldt ..	Sept. 3,	Nothing yet decided as to representation of Her Majesty's Government	7
13	To Board of Trade ..	4,	German Government are inquiring as to intentions of Her Majesty's Government. What are views of Board of Trade?	7
14	„ „ ..	4,	Replies to No. 11. Lord Salisbury merely expressed sympathy with the objects of the Conference in general terms, but reserved any general expression of opinion till Board of Trade had been consulted	8
15	Board of Trade	8,	General observations on scheme of Conference. Subjects for discussion should be limited. Settlement of load-line important, but no mention of it in Act. Inquire as to what principle will be followed as to voting, and what countries will be represented	8
16	To Sir L. West	Oct. 3,	Substance of No. 15, and copy	9
17	Mr. Phelps	5,	Calls attention to proposals made in No. 9. Would like an early reply	10
18	M. Jusserand	5,	What are intentions of Her Majesty's Government with regard to being represented?	11
19	To Mr. Phelps	8,	Replies in terms of No. 16	11
20	To M. Jusserand	18,	Sends extract of No. 16	12
21	To Count Hatzfeldt (also to M. de Soveral)	18,	Ditto	13
22	M. Jusserand	20,	Thanks for No. 20	13
23	Mr. Phelps	26,	United States' Government will adopt suggestion made in No. 16. They consider words of Act wide enough to include load-line question. Would like assent of Her Majesty's Government to being represented as soon as possible	13
24	To Board of Trade ..	29,	Sends above. What reply should be returned? ..	14
25	To Admiralty	29,	Sends correspondence. Will they communicate with Board of Trade as to reply?	14
26	Count Piper	Nov. 2,	Swedish Government want to know intention of Her Majesty's Government as to being represented	15
27	To Count Piper	5,	Sends extract of No. 16	15
28	Admiralty	6,	Will consult Board of Trade, as proposed ..	16
29	Lord Sackville	Oct. 30,	Sends correspondence with United States' Government. The United States' Minister in London has received the necessary instructions ..	16

No.	Name.	Date.	Subject.	Page
30	Admiralty	Dec. 4, 1888	Important to settle points for discussion before accepting invitation	17
31	Board of Trade	8,	Concurrence in foregoing. A Committee is at present engaged on the revision of the International Signal Code	18
32	Count Deym	17,	Austrian Government wish to know intentions of Her Majesty's Government as to being represented	18
33	To Count Deym	22,	Sends extract from No. 16	19
34	Mr. Phelps	22,	For reply to No. 23	19
35	To Mr. Phelps	29,	Her Majesty's Government must see programme of subjects for discussion before they can answer as to being represented	20
36	Mr. Phelps	Jan. 3, 1889	No more detailed programme can be formulated than that contained in the invitation till British adhesion is secured	20
37	To Representatives of Germany, France, Austria, Portugal, and Sweden and Norway in London	24,	Informs of conditions under which Her Majesty's Government accept invitation	20
38	To Mr. Phelps	24,	Her Majesty's Government accept invitation subject to their not being bound by any vote which may be taken unless their Delegate has acceded to it, and subject also to a prior settlement as to what questions are to be discussed	21
39	To Admiralty and Board of Trade	28,	Informs of above	21
40	Mr. Herbert	16,	United States' Government have decided to adjourn meeting of Conference to a later date	22
41	To Board of Trade and Admiralty	Feb. 2,	Sends extract from above	22
42	Mr. Herbert	Jan. 21,	Conference adjourned till autumn	22
43	Mr. White	Feb. 2,	Ditto	22
44	To Mr. White	5,	Acknowledges above	23
45	Admiralty	6,	Is it to be understood that decisions of Conference are to be taken *ad referendum* only ?	23
46	To Admiralty	9,	Answers above in affirmative	24
47	Mr. Herbert	6,	Seven United States' Delegates will now be appointed to draw up a programme of subjects for discussion	24
48	Mr. White	Mar. 12,	Meeting fixed for October. No objection to reservations proposed by Her Majesty's Government	24
49	Mr. Edwardes	1,	Substance of above	25
50	To Board of Trade and Admiralty	15,	Sends No. 48	26
51	Mr. White	May 13,	Sends detailed programme of subjects for discussion	26
52	To Admiralty and Board of Trade	17,	Sends inclosures in foregoing. Suggests that Board of Trade should confer with Lloyd's	30
53	To Mr. White	17,	Acknowledges No. 51	30
54	Sir J. Pauncefote	14,	Sends programme. "Flag signalling" omitted, and "load-line" included. Wishes to know names of Delegates of Her Majesty's Government	31
55	To Board of Trade and Admiralty	31,	Sends foregoing	31
56	M. Catalani	June 7,	Information required by Italian Government. As to representation of Her Majesty's Government	31
57	To M. Catalani	15,	Details not yet determined	32
58	Admiralty	15,	Think discussion should, in first instance, be confined to section 1 of Programme, *i.e.*, Rule of Road at Sea	32
59	Board of Trade	19,	Similar views to above	32
60	Sir G. Baden-Powell, M.P.	17,	Memorandum of questions that might be considered at Conference	33
61	To Sir J. Pauncefote	22,	Substance of No. 59	36
62	To Board of Trade	22,	For observations on No. 60	36
63	To Sir G. Baden-Powell, M.P.	22,	Acknowledges No. 60. Shall receive attention	37
64	Admiralty	26,	Names of their Delegates	37
65	To Count Hatzfeldt	July 2,	Informs of above	37
66	Board of Trade	2,	Answers No. 62. Not desirable to add any more subjects to programme	37
67	" "	9,	Names of their Delegates	38
68	To Treasury	15,	Sends correspondence respecting proposed Conference	38

No.	Name.	Date.	Subject.	Page

Correspondence respecting the International Marine Conference, held at Washington, 1888-89.

No. 1.

Sir L. West to the Marquis of Salisbury.—(Received March 7.)

(Extract.) *Washington, February 24, 1888.*

I HAVE the honour to inform your Lordship that a Bill has been passed by the Senate appropriating 30,000 dollars for an International Maritime Conference to be held in Washington in October next. It authorizes and requests the President to invite the Government of each maritime nation to send Delegates to a Marine Conference, and to appoint five Delegates to represent the United States.

The object of this Conference is to revise and amend the "Rule of the Road at Sea," and the "International Code of Flag and Night Signals;" to adopt a uniform system of marine signals or other means of plainly indicating the direction in which vessels are moving in fog, mist, falling snow, and thick weather, and at night; to compare and discuss the various systems employed for the saving of life and property from shipwreck; for reporting, marking, and removing dangerous wrecks or obstructions to navigation; for designating vessels for conveying to mariners and persons interested in shipping, warnings of approaching storms, of dangers to navigation, of changes in lights, buoys, and other day and night marks; and to formulate and submit for ratification to the Governments of all maritime nations proper International Regulations for the prevention of collision and other avoidable marine disasters.

No. 2.

Foreign Office to Board of Trade.

Sir, *Foreign Office, March 7, 1888.*

I AM directed by the Secretary of State for Foreign Affairs to transmit to you, to be laid before the Board of Trade, the accompanying despatch* respecting a Bill which has been passed by the United States' Senate, proposing an International Conference on the subject of the Rule of the Road at Sea, and I am to request the favour of the Board's observations on the matter.

I am, &c.
(Signed) T. V. LISTER.

---

* No. 1.

No. 3.

Board of Trade to Foreign Office.—(*Received March* 21.)

Sir, *Board of Trade, London, March* 20, 1888.

I AM directed by the Board of Trade to acknowledge the receipt of your letter of the 7th instant respecting a Bill which has been passed by the United States' Senate, proposing an International Conference on the subject of the Rule of the Road at Sea, and other questions, and requesting their observations on the matter.

In reply, I am to state, for the information of the Marquis of Salisbury, that, as Her Majesty's Government do not appear to have been yet invited to send Delegates to the proposed Congress, it would seem premature to enter at length or in detail into the questions raised by the proposal; but I am to observe that the Rule of the Road at Sea, as laid down in the International Regulations for the prevention of collisions at sea, is now accepted by all the great maritime countries (including the United States), with some slight exceptions in regard to the lights to be carried by fishing-vessels off the coast of Europe lying north of Cape Finisterre. There would seem, therefore, to be no need for an International Conference to revise and amend these Regulations, and the Board of Trade have received no intimation whatever that any Maritime State thinks their amendment desirable. As regards the International Code of Signals, I am to state that that Code is now under revision by a Committee appointed by the Board of Trade. The terms of the reference to this Committee will be seen by the inclosed copy of the minute of appointment.

I am to add that, as the initiative with regard to this and other such matters has hitherto been taken by this country, the Board of Trade would suggest, for Lord Salisbury's consideration, the desirability of London, and not Washington, being selected for a Conference, if such a Conference is needed.

I have, &c.
(Signed) HENRY G. CALCRAFT.

No. 4.

The Marquis of Salisbury to Sir L. West.

Sir, *Foreign Office, March* 27, 1888.

I CAUSED your despatch of the 24th ultimo, respecting the proposals of the United States' Senate for an International Maritime Conference to be held at Washington to amend the Rule of the Road at Sea and the International Code of Signals, &c., to be communicated to the Board of Trade; and I now inclose, for your information and guidance, a copy of a letter which I have received from that Department on the subject.*

I am, &c.
(Signed) SALISBURY.

No. 5.

The Marquis of Salisbury to Sir L. West.

Sir, *Foreign Office, June* 13, 1888.

WITH reference to my despatch of the 27th March, I should be glad to learn whether any further steps have been taken in the matter of the Bill passed by both Houses of the United States' Congress for holding a Maritime Congress at Washington.

I am, &c.
(Signed) SALISBURY.

* No. 3.

No. 6.

Foreign Office to Board of Trade.

Sir, *Foreign Office, June* 13, 1888.

I AM directed by the Marquis of Salisbury to request you to state to the Board of Trade that Her Majesty's Minister at Washington has been furnished, for his information and guidance, with a copy of your letter of the 20th March last respecting the Bill passed by both Houses of the United States' Congress for holding a Maritime Conference at Washington.

The Committee of Lloyd's having requested that they might have an opportunity of bringing some matters under the consideration of the Secretary of State, in the event of Her Majesty's Government sending a Representative to the Conference, they have been informed of the general sense of your above-mentioned letter, and of the action taken on it.

Her Majesty's Minister at Washington has now been requested to report whether anything further has been done in the matter of the proposed Conference.

I am, &c.

(Signed) JAMES FERGUSSON.

No. 7.

Mr. Edwardes to the Marquis of Salisbury.—(Received July 23.)

My Lord, *Washington, July* 13, 1888.

WITH reference to your Lordship's despatch of the 13th ultimo, I have the honour to state that the Act to provide for an International Marine Conference for securing greater safety for life and property at sea was signed by the President on the 10th instant.

The Law has not yet been printed, but copies of it shall be forwarded to your Lordship as seon as they can be obtained.

I have, &c.

(Signed) H. G. EDWARDES.

No. 8.

Sir L. West to the Marquis of Salisbury.—(Received August 6.)

(Extract.) *Beverly, Massachusetts, July* 20, 1888.

WITH reference to Mr. Edwardes' despatch of the 13th instant, I have the honour to inclose to your Lordship herewith copies of an Act providing for an International Maritime Conference to secure greater safety for life and property at sea, which has been passed by Congress, and approved by the President.

Inclosure in No. 8.

[Public.—No. 167.]

An Act providing for an International Marine Conference to secure greater Safety for Life and Property at Sea.

BE it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that the President of the United States be, and he hereby is, authorized and requested to invite the Government of each maritime nation to send Delegates to a Marine Conference that shall assemble at such time and place as he may designate, and to appoint seven Delegates, two of whom shall be officers of the United States' navy and one an official of the Life Saving Service, two masters from the merchant marine (one from the sailing marine and one from the steam marine), and two citizens familiar with shipping and Admiralty practice, to represent the said United States at said Marine Conference, and to fill vacancies in their number.

Sec. 2. That it shall be the object of said Marine Conference to revise and amend the Rules, Regulations, and practice concerning vessels at sea, and navigation generally, and the "International Code of Flag and Night Signals;" to adopt a uniform system of marine signals, or other means of plainly indicating the direction in which vessels are moving in fog, mist, falling snow, and thick weather, and at night; to compare and discuss the various systems employed for the saving of life and property from shipwreck; for reporting, marking, and removing dangerous wrecks or obstructions to navigation; for designating vessels for conveying to mariners and persons interested in shipping, warnings of approaching storms, of dangers to navigation, of changes in lights, buoys, and other day and night marks, and other important information; and to formulate and submit for ratification to the Governments of all maritime nations proper International Regulations for the prevention of collisions and other avoidable marine disasters.

Sec. 3. That the sum of 20,000 dollars, or so much thereof as shall be necessary, is hereby appropriated, out of any money in the Treasury of the United States not otherwise appropriated, for the necessary expenses of said Marine Conference, including the pay and allowances of the Representatives of the United States States therein, which shall be at the rate of 5,000 dollars per annum, and actual necessary expenses, for such Delegates as are not salaried officers of the United States, and the latter shall be allowed their actual necessary expenses. The Secretary of the Navy is hereby authorized to provide the Conference with such facilities as may be deemed necessary. The powers and authority conferred by this Act upon the persons appointed by the President by force thereof shall terminate on the 1st day of January, A.D. 1890, or sooner at the discretion of the President.

Sec. 4. That it shall be the duty of the Secretary of State to transmit to Congress a detailed statement of the expenditures which may have been incurred under the provisions of this Act.

Approved July 9, 1888.

No. 9.

Mr. Phelps to the Marquis of Salisbury.—(*Received August* 15.)

My Lord, *Legation of the United States, London, August* 14, 1888.

REFERRING to the conversation I had with your Lordship yesterday relative to the invitation sent by my Government to Her Majesty's Government, and to those of other maritime nations, to take part in an International Conference at Washington in April next, the object of which is to revise existing Regulations for preventing the loss of life at sea by collision and other accidents, I have now the honour to transmit to your Lordship copies of the instructions I have received on the subject from the Secretary of State of the United States, and of the Act of Congress upon which it is based.

The reasons for the proposed Conference are so fully set forth in this instruction, and were so far considered in the conversation above mentioned, that I can add no further suggestions likely to be useful.

I may, however, express the hope entertained by my Government that Her Majesty's Government may see their way to participating in a proposal so important and so interesting, in which the interests of the two countries are altogether in common, and in the consideration of which their views will be probably so harmonious.

If it should be found, as was suggested by your Lordship yesterday, that the range of the proposed inquiry is larger than may be deemed advisable, I venture to think that when the Conference assembles no difficulty will be encountered in restricting its deliberations, nor, on the other hand, in including within them any topic germane to the purpose of the Conference which has not been specifically mentioned in the instruction of the Secretary of State.

I have, &c.

(Signed) E. J. PHELPS.

Inclosure 1 in No. 9.

Mr. Bayard to Mr. Phelps.

Sir, *Department of State, Washington, July* 30, 1888.

THE Congress of the United States has passed an Act, which received the President's approval on the 9th of the present month, providing for an International Marine Conference to secure greater safety for life and property at sea. By this Act the President is requested to invite the other Maritime Powers of the world to take part in a Conference the objects of which are, in brief, to revise the present International Regulations for preventing collisions at sea, especially with reference to signalling in fog; to revise the existing code of flag signals; to compare and discuss the various systems employed for the saving of life and property from shipwreck; to devise methods of reporting, marking, and removing dangerous wrecks and obstructions to navigation; and to establish uniform means of conveying to mariners warnings of storms and other information.

The great interest and importance of this subject justifies an extended reference to the principal objects of the proposed Conference, and to the steps already taken in the same direction.

In 1863 the Government of Great Britain invited the other maritime nations, in the interest of commerce at large, to examine the Code of Laws adopted by it in 1862 for preventing collisions at sea, and, if found suitable, to legalize them.

In the course of the next two years thirty-four of the principal maritime nations of the world had approved and adopted these Laws.

In 1877, it having been found that the Laws so adopted did not fulfil the requirements of marine commerce, the British Government took steps, by the appointment of a Commission, to frame a revised set of Laws. These, when formulated, were submitted to all the maritime nations, and after sixteen of these Powers had signified their approval, they went into effect on the 1st September, 1880.

These Regulations, however, are believed to be inadequate to the present needs of commerce, in respect especially to the sound signals for use in fog, mist, or falling snow. The increasing number and speed of steam-vessels has greatly added to the dangers of collision in thick weather, and the opinion has recently been expressed by the best authorities that the present system of signals for steam-vessels is insufficient.

The present Code of Flag Signals is also believed to stand in need of careful revision. This system originated in Great Britain in 1856, and experience has shown the necessity of extending the list of names of places and words and phrases, as well as of considering whether greater rapidity and accuracy in signalling cannot be attained.

With respect to the protection of life and property from shipwreck, no general International Agreement is regard to on and off shore signalling, or as to the *modus operandi* of the life-saving service of the different nations, is known to exist. In spite of the utmost efforts of those engaged in the life-saving service of the United States, lives have been lost from foreign vessels stranded on our coast because of a misunderstanding of our methods; and it is believed that the experience of other countries in this regard is similar to our own.

The destruction, or at least the frequent and accurate reporting, of dangerous derelicts is also a matter of the highest importance; and it is obvious that this work can be thoroughly done only by means of the hearty co-operation of the principal maritime nations.

Closely connected with the subject of reporting derelicts is that of conveying warning of storms, and of giving information of recently discovered dangers to navigation, and changes in lights, buoys, and other day or night marks, which can probably best be undertaken by the adoption of some carefully considered international system.

Another important topic, although not enumerated in the Act of Congress which gives rise to the present invitation, is that of an uniform system for the loading of vessels. This subject has recently attracted earnest attention in Great Britain, and a Royal Commission on the Loss of Life at Sea, appointed in 1884, reported in August 1887, recommending that Her Majesty's Government should take steps to invite a Conference of Maritime States to consider how far it might be possible to agree upon such Rules and upon Regulations for their enforcement. Additional

force would attach to the recommendations of the projected Conference, were the British view in regard to overloading at sea to be brought up by Her Majesty's Delegates as pertinent to the general objects of the Conference, rather than as matter for an independent comparison of international views.

This review of the general purposes of the Conference indicates the great interest and the active measures which Great Britain has always taken in the subjects to which I have referred. In view of this, as well as of the importance and extent of British maritime interests, the President recognizes the necessity of the adhesion of Her Majesty's Government to the plan of the proposed Conference, and, indeed, of its active co-operation therein, if the labours of that body are to meet with general acceptance and success.

By direction, therefore, of the President of the United States, you will tender to the Government of Great Britain a cordial invitation to be represented, by such number of Delegates as may seem to it convenient, at an International Conference to be convened at the city of Washington, on Wednesday, the 17th day of April, 1889; the purposes of such Conference being "to revise and amend the Rules, Regulations, and practice concerning vessels at sea, and navigation generally, and the 'International Code of Flag and Night Signals;' to adopt a uniform system of marine signals, or other means of plainly indicating the direction in which vessels are moving in fog, mist, falling snow, and thick weather, and at night; to compare and discuss the various systems employed for the saving of life and property from shipwreck, for reporting, marking, and removing dangerous wrecks or obstructions to navigation, for designating vessels for conveying to mariners and persons interested in shipping, warnings of approaching storms, of dangers to navigation, of changes in lights, buoys, and other day and night marks, and other important information; and to formulate and submit for ratification to the Governments of all maritime nations proper International Regulations for the prevention of collisions and other avoidable marine disasters."

It will be understood by all States taking part in this Conference that no questions relating to the regulation of trade and commerce are within the scope of the discussion, and that in the disposition of questions to come before the Conference no State shall be entitled to more than one vote, whatever be the number of Delegates it may send.

* * * * * *

Your own discretion will doubtless suggest to you the most effective manner of making known the great interest taken by the President in the benevolent purposes of the projected Conference, and his desire and expectation that, in the universal interest of seafaring humanity, Her Majesty's Government will receive and respond to our invitation in the same spirit in which it is extended.

I am, &c.

Sir, *Board of Trade, London, August* 28, 1888.

I AM directed by the Board of Trade to acknowledge the receipt of your letter of the 17th instant, inclosing a note and other papers received from the American Minister in London on the subject of a Maritime Conference which the Government of the United States propose shall be held in Washington, and expressing the hope of that Government that the Government of Her Majesty may be represented thereat.

These papers have been read by the President of this Board, and he proposes to be at this Office on the 4th September proximo, to consider the matter further; and, in the meantime, has expressed a wish that he may be furnished with the purport of the suggestions made by Lord Salisbury in the conversation between his Lordship and Mr. Phelps referred to in that gentleman's letter addressed to Lord Salisbury on the 14th instant.

I am to add that it will be convenient that the information now asked for should be sent before the 4th proximo.

Foreign Office to Board of Trade.

SIR VILLIERS LISTER presents his compliments to the Assistant Secretary, Marine Department, and is directed by the Marquis of Salisbury to state, for the information of the Board of Trade, with reference to the letter of the 28th ultimo, which was forwarded to his Lordship at Royat, that in his conversation with the United States' Minister at this Court on the subject of the proposed Maritime Conference at Washington, he reserved the expression of any opinion till the Board had been consulted. Lord Salisbury only expressed general sympathy with the objects of the Conference, and suggested that the best way of obtaining a practical result in any inquiry was to abstain from including too large a number of subjects.

Mr. Phelps' note of the 14th ultimo is herewith returned.

Foreign Office, September 4, 1888.

No. 15.

Board of Trade to Foreign Office.—(Received September 11.)

Sir, *Board of Trade, London, September* 8, 1888

WITH reference to previous correspondence, and more particularly to your letter of the 17th ultimo, transmitting, by direction of the Secretary of State for Foreign Affairs, a note from the American Minister in London on the subject of the Maritime Conference which it is proposed to hold in Washington next April, and expressing the hope of the United States' Government that the Government of Her Majesty may be represented thereat, I am directed by the Board of Trade to lay before you the following observations for the consideration of Lord Salisbury.

The Board of Trade are fully alive to the advantages which might arise from a thorough and practical discussion of some of the questions which are proposed to be referred to the Conference.

In their opinion, it would be of the greatest benefit if all the Maritime Powers could be brought to a common agreement on such matters as the "load line," and other Regulations which have been adopted by this country for the purpose of securing the safety and health of crews and passengers at sea; and therefore they note with special satisfaction Mr. Bayard's suggestion that the adoption of an uniform system for the loading of vessels should be brought before the proposed Conference by the Delegates of Her Majesty's Government. But it is to be observed that this subject, though peculiarly important to the British mercantile marine, is not specifically mentioned in the Act of Congress, so that its consideration by the Conference could only be justified by those general words of the Act which are wide enough to include any matter affecting vessels at sea; while, on the other hand, one of the questions named, viz., the question of flag signals, has already been to some extent dealt with in another manner. Some time since, an important Committee was appointed, consisting of the best experts of the day, to revise the present Code. That inquiry has resulted in a partial rearrangement of the Code, and it is about to be sent out to all the foreign Maritime Powers for their observations and consideration; it would therefore hardly seem necessary to include this subject in the order of reference to a Conference embracing so many other matters of importance.

The Board of Trade entirely concur in the view expressed by Lord Salisbury, that the best way of obtaining a practical result in any inquiry would be to abstain from including too large a number of subjects; and in order in insure this, they think that the wide range of discussion which would be possible under the provisions of the Act of Congress should be limited before the meeting of the Conference, and they would suggest that the attention of the United States' Government should be called to the points above referred to, and that they should be asked, in the first place, to forward an order of reference showing in detail the exact questions to which the deliberations of the Conference should be confined.

The Board of Trade would further observe that it is not stated what countries have been invited to send Delegates to the Conference, or what position has been

taken up by those countries. This involves a point which requires grave consideration before the invitation to the Conference could be properly accepted by Her Majesty's Government. The exceptional importance and extent of British maritime interests are fully admitted by Mr. Bayard, yet it is proposed that, in the disposition of questions to come before the Conference, no State is to be entitled to more than one vote. It cannot, of course, be supposed that Great Britain, whose tonnage is nearly equal to that of all other nations combined, would submit to be outvoted on matters of vital importance to shipping by Powers hardly possessing any mercantile marine at all, but difficulties might arise even in matters of minor consequence. For instance, it is possible that inventors might, through the medium of the Delegates of some of the smaller Powers, press upon the Conference the merits of their inventions, and by the votes of those Powers obtain the sanction of the Conference to contrivances which, although showing some mechanical skill, would be useless in practical seamanship. It would manifestly be very disadvantageous to British shipping that an important Conference should recommend appliances the use of which might entail a large and unnecessary expense.

The Board of Trade are not aware whether any precedents exist for a suggestion that the Powers taking part in the Conference shall be allowed such number of votes as would be fairly proportioned to their maritime interests, but they would be glad if the Foreign Office would consider the advisability of proposing such an arrangement to the Government of the United States. The extent of the mercantile marine of some of our Colonies, especially of Canada, affords additional reason in its favour. Should, however, any scheme of the kind be found impracticable, the Board of Trade think it absolutely essential that the Delegates who may be appointed to represent Her Majesty's Government should be distinctly instructed to inform the Conference that any proposals which they might make, or any action which the Conference might adopt, would not bind Her Majesty's Government, but would only be taken *ad referendum*.

In the event of Her Majesty's Government deciding to be represented at the proposed Conference, the Board of Trade will be prepared to name Delegates who they think would adequately represent British interests, and they have raised the above points, not with any desire to throw obstacles in the way of an acceptance of the cordial invitation of the United States' Government, but because it is necessary to bear in mind the exceptional disproportion between the interests of Great Britain in the subject-matter of the Conference and those of the other countries.

Should these points be satisfactorily arranged, the Board of Trade believe that a full and ample discussion at the Conference would be beneficial to the mercantile marine of this country.

I have, &c.
(Signed) HENRY G. CALCRAFT.

No. 16.

The Marquis of Salisbury to Sir L. West.

Sir, *Foreign Office, October* 3, 1888.

I INCLOSE a copy of a note from the United States' Minister,* expressing, on behalf of his Government, the hope that Her Majesty's Government will be represented at the Maritime Conference which it is proposed to hold at Washington, and which formed the subject of your despatch of the 20th July last.

Her Majesty's Government are fully alive to the advantages which would arise from a thorough and practical discussion of some of the questions which are to be referred to the Conference. It would, in their opinion, be of the greatest benefit if all the Maritime Powers could be brought to a common agreement on such matters as the "load line," and other Regulations which have been adopted by this country for the purpose of securing the safety and health of crews and passengers at sea; and they therefore received with special satisfaction Mr. Bayard's suggestion that the adoption of an uniform system for the loading of vessels should be brought before the proposed Conference by the Delegates of Her Majesty's Government. But it is to be observed that this subject, though peculiarly important to the British

* No. 9.

mercantile marine, is not specifically mentioned in the Act of Congress, so that its consideration by the Conference, if the latter is to be entirely subject to the Act in question, would only be justified by those general words of the Act which are wide enough to include any matter affecting vessels at sea. It is to be observed, however, that one of the questions named, viz., flag signals, has already been to some extent dealt with in another manner. Some time since an important Committee was appointed, consisting of the best experts of the day, to revise the present Code. That inquiry has resulted in a partial rearrangement of the Code, which, in its amended form, is about to be sent to all the Maritime Powers for their observations and consideration; it would therefore hardly seem necessary to include this subject in the order of reference to a Conference embracing so many other matters of importance.

Her Majesty's Government are very decidedly of opinion that the best way of obtaining a practical result at the Conference would be to abstain from including too large a number of subjects on its agenda paper. They would therefore suggest that the wide range of discussion which would be possible under the provisions of the Act of Congress should be limited before the meeting of the Conference; and they would be glad to receive an order of reference, or programme of the subjects to be discussed, showing in detail the exact questions which the deliberations of the Conference will comprise.

Her Majesty's Government would also be glad to know what countries have been invited to take part in the Conference, as well as the conditions and reservations, if any, under which their acceptance of the invitation has been given.

Should Her Majesty's Government be represented, it must, of course, be understood that, as is the constant practice at Technical Conferences of this nature, Great Britain will be represented by Delegates who will not have power to bind Her Majesty's Government to any proposals which the British Delegates may make, and, likewise, any action which the Conference may adopt or recommend would, in the usual course, be *ad referendum* only for the consideration and decision of the Governments represented.

I have to request you to address to the Government of the United States a communication in the sense of the above.

I inclose, for your private information, a copy of the letter from the Board of Trade on the subject of the proposed Conference.*

I am, &c.
(Signed) SALISBURY.

No. 17.

Mr. Phelps to the Marquis of Salisbury.—(*Received October* 6.)

My Lord, *Legation of the United States, London, October* 5, 1888.

I AM requested by my Government to recall your Lordship's attention to its proposal, which I had the honour to communicate to you by note of the 14th August last, that Her Majesty's Government should send Delegates to an International Conference which it is intended to hold at Washington for the purpose of proposing improvements in the existing Regulations for preventing the loss of life and property at sea by collision and other accidents.

I am now requested by the Secretary of State of the United States to ask for as early a reply as may be convenient to this proposal, for the reason that action in respect to it, under the Acts of Congress relating to the subject, is desirable and cannot usefully be taken until such reply is received.

As in my former note I inclosed to your Lordship a copy of the instruction I had received from my Government, in which the scope of the proposed Conference, and the necessity for it, are fully and clearly set forth, and as in the conversation I had the honour to hold with your Lordship relating to it the subject was fully gone into, I add nothing further to what has thus been laid before you.

I beg respectfully to refer to my former note and its inclosures. And I venture to express the hope that Her Majesty's Government may see their way to concur

* No. 15.

with that of the United States in a proposal so humane and desirable, and which without such concurrence must largely fail of effect.

I have, &c.

No. 19.

The Marquis of Salisbury to Mr. Phelps.

Sir, *Foreign Office, October 8*, 1888.

I HAVE the honour to acknowledge the receipt of your note of the 5th instant respecting the representation of Her Majesty's Government at the forthcoming Maritime Conference, and, in reply, I have to request that you will be good enough to convey the following observations to the United States' Government.

Her Majesty's Government are fully alive to the advantages which would arise from a thorough and practical discussion of some of the questions which are to be referred to the Conference. It would, in their opinion, be of the greatest benefit if all the Maritime Powers could be brought to a common agreement on such matters as the "load line" and other Regulations which have been adopted by this country for the purpose of securing the safety and health of crews and passengers at sea; and they therefore received with special satisfaction Mr. Bayard's suggestion that the adoption of an uniform system for the loading of vessels should be brought before the proposed Conference by the Delegates of Her Majesty's Government. But it is to be observed that this subject, though peculiarly important to the British

mercantile marine, is not specifically mentioned in the Act of Congress, so that its consideration by the Conference, if the latter is to be entirely subject to the Act in question, would only be justified by those general words of the Act which are wide enough to include any matter affecting vessels at sea. It is to be observed, however, that one of the questions named, viz., flag signals, has already been to some extent dealt with in another manner. Some time since, an important Committee was appointed, consisting of the best experts of the day, to revise the present Code. That inquiry has resulted in a partial rearrangement of the Code, which in its amended form is about to be sent to all the Maritime Powers for their observations and consideration; it would therefore hardly seem necessary to include this subject in the order of reference to a Conference embracing so many other matters of importance.

Her Majesty's Government are very decidedly of opinion that the best way of obtaining a practical result at the Conference would be to abstain from including too large a number of subjects on its agenda paper. They would therefore suggest that the wide range of discussion which would be possible under the provisions of the Act of Congress should be limited before the meeting of the Conference; and they would be glad to receive an order of reference, or programme of the subjects to be discussed, showing in detail the exact questions which the deliberations of the Conference will comprise.

Her Majesty's Government would also be glad to know what countries have been invited to take part in the Conference, as well as the conditions and reservations, if any, under which their acceptance of the invitation has been given.

Should Her Majesty's Government be represented, it must of course be understood that, as is the constant practice at Technical Conferences of this nature, Great Britain will be represented by Delegates who will not have power to bind Her Majesty's Government to any proposals which the British Delegates may make, and, likewise, any action which the Conference may adopt or recommend would, in the usual course, be *ad referendum* only for the consideration and decision of the Government represented.

Her Majesty's Minister at Washington has already been instructed to address a communication to your Government in the above sense.

M. le Ministre, *Foreign Office, November* 5, 1888.

I HAVE the honour to acknowledge the receipt of your note of the 2nd instant, inquiring, on behalf of the Swedish Government, whether Her Majesty's Government intend to take part in the Maritime Conference which the United States' Government propose to hold at Washington in April next.

In reply, I have the honour to inclose, for the information of the Swedish Government, an extract of a despatch which I addressed, on the 3rd ultimo, to Her Majesty's Minister at Washington,* stating the views of Her Majesty's Government respecting the proposed Conference.

Her Majesty's Minister was instructed to address a note to the United States' Government in the sense of these observations.

I have, &c.

No. 29.

Lord Sackville to the Marquis of Salisbury.—(*Received November* 12.)

My Lord, *Washington, October* 30, 1888.

I HAVE the honour to acknowledge the receipt of your Lordship's despatch of the 3rd instant, relative to the International Maritime Conference which it is proposed to hold at Washington, and to forward herewith copy of a note which I have addressed to the United States' Government.

It will be seen from the reply which I have received from the United States' Government, copy of which I also inclose, that the United States' Minister in London has been instructed to inform your Lordship that the representation of Her Majesty's Government at the Conference *ad referendum* would be satisfactory, and that as soon as the invitation shall be definitely accepted by Her Majesty's Government, the American Commission will be appointed. and will at once formulate a programme and will make every effort to simplify it so as to meet the views of Her Majesty's Government.

I have, &c.
(Signed) SACKVILLE.

Inclosure 1 in No. 29.

Sir L. West to Mr. Bayard.

Sir, *Washington, October* 22, 1888.

WITH reference to the invitation conveyed to Her Majesty's Government by the Government of the United States to take part in an International Maritime Conference to be held at Washington in April next, I have the honour to inform you that I am instructed by the Marquis of Salisbury to state that Her Majesty's Government are fully alive to the advantages which would arise from a thorough and practical discussion of the questions which are to be referred to it. It would be, in their opinion, of the greatest benefit if all the Maritime Powers could be brought to a common agreement on such matters as the "load line" and other Regulations which have been adopted by Great Britain for the purpose of securing the safety and health of crews and passengers at sea, and they therefore received with special satisfaction your suggestion that the adoption of an uniform system for the loading of vessels should be brought before the proposed Conference by the Delegates of Her Majesty's Government. But it is to be observed that this subject, though peculiarly important to the British mercantile marine, is not specifically mentioned in the Act of Congress, so that its consideration by the Conference, if the latter is to be entirely subject to the Act in question, would only be justified by those words of the Act which are wide enough to include any matter affecting vessels at sea. It is, however, to be observed that one of the questions named, viz., "flag signals," has already been to some extent dealt with in another manner. Some time since, an important Committee was appointed, consisting of the best experts of the day, to revise the present Code. That inquiry resulted in a partial rearrangement of the Code, which, in its amended form, is about to be sent to all the Maritime Powers for their observations and consideration; it would therefore seem hardly necessary to include this subject in the order of reference to a Conference embracing so many other matters of importance.

Her Majesty's Government are very decidedly of opinion that the best way of obtaining a practical result at the Conference would be to abstain from including too large a number of subjects on its agenda paper. They would therefore suggest that the wide range of discussion which would be possible under the provisions of the Act of Congress should be limited before the meeting of the Conference, and they would be glad to receive an order of reference, or programme of the subjects to be discussed, showing in detail the exact questions which the deliberations of the Conference will comprise.

Her Majesty's Government would also be glad to know what countries have been invited to join in the Conference, as well as the conditions and reservations, if any, under which their acceptance of the invitation has been given. Should Her Majesty's Government be represented, it must of course be understood that, as is the constant practice at Technical Conferences of this nature, Great Britain will be represented by Delegates who will not have power to bind Her Majesty's Government. Any proposals which the British Delegates may make, and likewise any action which the Conference may adopt or recommend, would, in the usual course, be *ad referendum* only for the consideration and decision of the Government represented.

I have, &c.
(Signed) L. S. SACKVILLE WEST.

Inclosure 2 in No. 29.

Mr. Rives to Lord Sackville.

My Lord, *Washington, October* 24, 1888.

I HAVE the honour to acknowledge the receipt of your note of the 22nd instant, making certain suggestions on behalf of your Government with a view to arriving at an understanding as to the precise questions to be submitted to the proposed Washington International Maritime Conference.

In reply, I have the honour to inform you that the views of Her Britannic Majesty's Government with reference to this subject, substantially as expressed in your note, having been learned through the American Legation at London, this Department, on the 22nd instant, before the receipt of your communication, had instructed Mr. Phelps by telegraph to say to Lord Salisbury that the representation of his Government at the Conference *ad referendum* would be satisfactory, and that as soon as the invitation shall be definitely accepted by Her Majesty's Government, the American Commission will be appointed, and will at once formulate a programme, and will make every effort to simplify it so as to meet the views of Her Majesty's Government.

The Department hopes that the above explanation will enable Her Majesty's Government to see its way clear to definitely accepting the invitation, in view of the fact that but little time remains for preliminaries, and early action is therefore very desirable.

I have, &c.
(Signed) G. L. RIVES, *Acting Secretary.*

No. 30.

Admiralty to Foreign Office.—(Received December 5.)

Sir, *Admiralty, December* 4, 1888.

REFERRING to your letter of the 29th October last, I am commanded by my Lords Commissioners of the Admiralty to state, for the information of the Marquis of Salisbury, that their Lordships have been in consultation with the Board of Trade in regard to the reply which should be returned to the proposal of the United States' Government that Her Majesty's Government should be represented at an International Maritime Conference to be held at Washington.

2. In regard to such of the subjects proposed for discussion at the Conference as affect the Naval Service, my Lords desire me to offer the following remarks:—

(1.) Their Lordships are not favourable to the idea of a Conference on any o the subjects in question, some of them not appearing to require any international settlement, whilst in respect to the others their Lordships do not consider that a Conference would be the best method of arriving at a mutual agreement.

(2.) My Lords are of opinion that the number of subjects in the proposal as it

stands is far too great, and the scope of the subjects themselves too wide, to afford any probability that a useful result would be arrived at; and their Lordships consider that the adhesion of Her Majesty's Government to the principle of a Conference should not, in any case, be given until the subjects have been reduced in number and are better defined.

(3.) On the supposition, however, that Her Majesty's Government may deem it desirable to consent to a Conference, my Lords are of opinion that such Conference should not meet until the points to be discussed in connection with each subject admitted have been defined by previous correspondence between the Governments sending Delegates. It would also be desirable, in my Lords' opinion, that the propositions and amendments to be brought forward should be, as far as possible, determined beforehand, and communicated to the different Delegates.

The only subjects which my Lords consider are in any way suitable for international discussion are:—

(*a.*) Signals in fog, &c., to indicate a ship's course.

(*b.*) Such portion of the proposition relating to navigational warnings as may relate to an uniform system of buoyage.

(*c.*) The Regulations for preventing collisions at sea; provided that the points to be discussed are strictly laid down beforehand.

3. The above subjects would, in the opinion of my Lords, afford ample material for discussion by the proposed Conference, apart from any questions which come within the province of the Board of Trade only.

I am, &c.
(Signed) EVAN MACGREGOR.

No. 31.

Board of Trade to Foreign Office.—(*Received December* 10.)

Sir, *Board of Trade, London, December* 8, 1888.

WITH reference to previous correspondence, I am directed by the Board of Trade to state, for the information of the Marquis of Salisbury, that, in accordance with the desire expressed in your last letter, they have consulted with the Lords Commissioners of the Admiralty as to the reply which should be returned to the invitation of the United States' Government. As the result of that consultation, the Board learn that the Lords Commissioners of the Admiralty have addressed a letter to the Foreign Office fully embodying their views in regard to such of the subjects suggested for consideration at the Conference as more particularly affect the Naval Service, and with the views expressed therein the Board of Trade entirely concur.

As regards those points more particularly affecting the mercantile marine, and dealt with by the Board of Trade, they have to observe that, as regards signals in fog, &c., to indicate a ship's course, a Committee is now sitting to consider the revision of the International Code of Signals, and that such Committee is composed of members most competent to deal with the matter. To this Committee the various proposed systems of fog signals, &c., have been submitted for consideration, and it appears to the Board that, upon the receipt of the Committee's Report in the matter, a good basis will have been arrived at to work on, and that, at present, further consideration of the matter is unnecessary.

Until a more definite reply is received from the United States' Government, defining more clearly the actual subjects proposed to be considered, the Board are not in a position to go beyond the substance of their letter of the 8th September.

On the whole, the Board of Trade fully concur with the Lords Commissioners of the Admiralty in their doubts as to the usefulness of a Conference unless the subjects to be discussed are clearly laid down.

I have, &c.
(Signed) HENRY G. CALCRAFT.

I HAVE the honour to inform your Lordship that it was stated in this morning's newspapers here that the United States' Government had withdrawn the invitations to the proposed International Conference owing to the difficulties alleged to have been made by Great Britain with regard to the project.

I have this afternoon received a letter from the Assistant Secretary of State, with whom I immediately communicated on the subject, in which he (the Assistant Secretary of State) informs me that the report is incorrect, but he says, at the same time, that the United States' Government have decided to postpone the meeting of the Conference until the autumn.

Mr. Rives adds that the date originally fixed for the meeting is just three months from to-day, and that the authorities of the Navy Department are of opinion that this would be too short a time in which to prepare the preliminaries, even if the adhesion of Great Britain were now assured. It has therefore become necessary to postpone it until after the hot weather is over.

I have, &c.

* Also to Admiralty.

† No. 40.

15th January, of which I inclose a copy herewith, the President has deemed it advisable to postpone the meeting of the International Maritime Conference from the 17th April to the early autumn of this year; and I beg furthermore to add that the date of meeting, when fixed, will be communicated without delay to Her Majesty's Government.

I have, &c.
(Signed) HENRY WHITE.

Inclosure in No. 43.

Mr. Bayard to Mr. Phelps.

Sir, *Department of State, Washington, January* 15, 1889.

REFERRING to my instruction of the 30th July last, which directed you to tender to the Government of Great Britain an invitation to be represented at an International Conference to meet in the city of Washington on Wednesday, the 17th April, 1889, for the purpose of securing greater safety for life and property at sea, I have now to inform you that, owing to the unexpected delay in receiving the responses of important maritime countries, and in particular that of Great Britain, and in view of the limited time remaining within which to prepare the programme of the subjects to be brought before the Conference, and communicate the same to the several Governments for their information and use in instructing their Delegates, the President has deemed it advisable to postpone the meeting of the Conference until a later date permitting the seasonable completion of the necessary preliminary arrangements.

By direction of the President, therefore, I have to request you to inform the Government of Great Britain, through the Minister for Foreign Affairs, that the meeting of the Conference in question, which was set for the 17th April next, is postponed until some time in the early autumn of this year, 1889, and that the date, when fixed, will be communicated as soon as possible.

I am, &c.

No. 45.

Admiralty to Foreign Office.—(Received February 7.)

Sir, *Admiralty, February* 6, 1889.

I AM commanded by my Lords Commissioners of the Admiralty to acknowledge the receipt of your letter of the 28th ultimo, notifying to my Lords that Her Majesty's Government have accepted the invitation of the United States' Government to the proposed Maritime Conference, to be held at Washington, subject to two reservations.

2. Under the wording of the first of these reservations, it appears to my Lords that if the British Representative at the Conference does agree to any Resolution arrived at, Her Majesty's Government will be bound by such Resolution; and as under such an arrangement their Lordships may find themselves committed to inconvenient propositions, I am to request that you will move the Secretary of State

to cause my Lords to be informed whether they are correct in presuming that any conclusions the Conference may arrive at will still be *ad referendum*.

I am, &c.
(Signed) EVAN MACGREGOR.

No. 46.

Foreign Office to Admiralty.

Sir, *Foreign Office, February* 9, 1889.

IN reply to your letter of the 6th instant, I am directed by the Marquis of Salisbury to state, for the information of the Lords Commissioners of the Admiralty, that any conclusions arrived at by the International Maritime Conference, to be held at Washington, will be merely *ad referendum*.

I am, &c.
(Signed) JAMES FERGUSSON.

No. 47.

Mr. Herbert to the Marquis of Salisbury.—(Received February 19.)

My Lord, *Washington, February* 6, 1889.

MR. RIVES told me to-day that your Lordship's note to Mr. Phelps of the 24th ultimo, announcing the acceptance, with certain reservations by Her Majesty's Government of the invitation of the United States, Government to take part in the Maritime Conference, had just been received, and that the appointment of the American Delegates would consequently be made out almost immediately.

These gentlemen, who are to be seven in number, will shortly meet in Washington and draw up a programme, which will be submitted in about six weeks' time to the various Powers who have consented to join the Conference.

I have, &c.
(Signed) MICHAEL H. HERBERT.

No. 48.

Mr. White to the Marquis of Salisbury.—(Received March 13.)

My Lord, *Legation of the United States, London, March* 12, 1889.

WITH reference to my note of the 2nd ultimo relative to the postponement of the meeting of the International Marine Conference, I now have the honour to acquaint your Lordship, in accordance with instructions contained in a despatch, of which I inclose a copy herewith, that the Conference will meet at Washington on Wednesday, the 16th October next.

The Delegates on the part of the United States, whose names will be found in the inclosed despatch, have already been appointed, and they have been directed to formulate a detailed programme for the deliberation of the Conference, which will be submitted, as soon as prepared, to the several Powers who are to be there represented.

Should this programme, when submitted, not be satisfactory, it is understood that, in view of the reservations made in your Lordship's note to Mr. Phelps of the 24th January last, Her Majesty's Government will be at liberty to withdraw their acceptance of the invitation of the United States' Government to the Marine Conference.

With regard to the first of these reservations, namely, that Her Majesty's Government will not be bound by any vote to which Her Majesty's Representative at the Conference has not assented, I am authorized to state that the understanding of my Government has been, that a representation of all the Powers *ad referendum* would be entirely satisfactory.

And with respect to the second reservation, viz., that the particular questions to be submitted to the Conference shall be agreed upon beforehand by the Governments to take part in it, I beg to add that there is likewise no objection on the part of my

Government, whose intention has always been that, as soon as such assurances of adhesion had been received from a sufficient number of the maritime Powers as to warrant reasonable expectations of success, the United States' Delegates should be appointed (as they now have been), and proceed to formulate a detailed programme for the deliberations of the Conference.

I have, &c.
(Signed) HENRY WHITE.

Inclosure in No. 48.

Mr. Bayard to Mr. White.

Sir, *Department of State, Washington, February* 27, 1889.

REFERRING to my instruction of the 15th January last, which informed you of the necessary postponement of the meeting of the Marine Conference intended to have been held at this capital on the 17th April next, I have now to inform you that since the date of that instruction additional replies have been received from several of the countries invited to participate.

The Governments of Brazil, Chile, Costa Rica, Denmark, France, Germany, Great Britain, Guatemala, Hawaii, Italy, Japan, the Netherlands, Nicaragua, Spain, Sweden and Norway, and Uruguay have all expressed their intention of being represented, and some have already appointed their Delegates.

The acceptance by these important maritime Powers gives gratifying assurance of the success of the Conference in effecting results of practical and lasting benefit; and a date may now be fixed for the meeting of the Conference, and steps taken to frame a detailed and definite programme. By direction of the President, therefore, I have to request you to inform Her Majesty's Government, through the appropriate channel, that the meeting of the Conference, which had been at one time proposed for the 17th April next, will take place on Wednesday, the 16th day of October, 1889.

I have further to inform you that the President has appointed the following-named persons as Delegates on the part of the United States, viz. :—

Rear-Admiral Samuel R. Franklin, United States' Navy; Commander William T. Sampson, United States' Navy; Sumner I. Kimball, General Superintendent United States' Life-Saving Service; James W. Norcross; John W. Shackford; William W. Goodrich; and Clement A. Griscom.

These Delegates have been instructed to assemble in Washington at an early date, and they will forthwith proceed to frame a detailed programme, in general accordance with the terms of the Act of Congress and of the instructions addressed to you on the 30th July last, which explained the President's views in regard to the scope and purposes of the intended Conference. It is expected that this programme will be ready by the 1st May next, and that it will then be submitted through our Legations abroad to the several Powers who have signified their intention to be represented.

It is proper also to observe—as the question has been asked by several Governments—that any proposals which the Delegates of the various Powers may make will be *ad referendum* only for the consideration and decision of the respective Governments.

Should the Government to which you are accredited have not already accepted the invitation extended through you, in accordance with my instructions of the 30th July, you are hereby directed to notify it of the fact of the postponement of the Conference, and to renew the invitation.

I am, &c.
(Signed) T. F. BAYARD.

My Lord, *Legation of the United States, London, May* 13, 1889.

WITH reference to my note of the 12th March and to previous correspondence, I have the honour, in accordance with instructions from my Government, to transmit herewith to your Lordship twelve copies of the programme framed by the Delegates on the part of the United States of subjects to be considered at the International Marine Conference which is to assemble at Washington in October next.

I have, &c.
(Signed) HENRY WHITE.

Inclosure in No. 51.

Programme of Subjects to be considered by the International Marine Conference, October 1889.

Department of State, International Marine Conference,
Sir, *Washington, April* 3, 1889.

I HAVE the honour to inform you that, in conformity with the instructions of the State Department of the 27th February, 1889, the Delegates, on the part of the United States to the International Marine Conference, met on Monday, the 25th ultimo, organized, and proceeded to the consideration of a detailed programme of the subjects to be considered by the International Conference for transmission to the several Powers.

This programme was completed on the 30th ultimo, and is herewith inclosed.

The correspondence between the State Department and the British Government on this subject was examined, and, in conformity with the intentions of our Government therein expressed, a consideration of the "International Code of Flag Signals" was excluded from the programme, and a consideration of the "load-line" was included. With this exception and this addition, the entire subject-matter of the Act of Congress of the 9th July, 1888, was arranged in general divisions, following as nearly as possible the precise language of the Act. These general divisions were then carefully considered, and each was arranged under subdivisions and subheads.

It is believed that this arrangement in detail is sufficiently broad to include all matters bearing directly upon the principal topics, and care has been taken at the

* Also to Admiralty.

† No. 48.

same time to avoid extending the field of deliberations of the Conference beyond the limits indicated in the Act of Congress and its interpretation by the State Department.

Very respectfully,
(Signed) S. R. FRANKLIN, *Rear-Admiral, U. S. N.*,
President of the Board of American Delegates.

Hon. James G. Blaine, Secretary of State.

Detailed Programme of Subjects to be considered by the International Marine Conference.—Framed by the American Delegates in accordance with Instructions from the Department of State, March 1889.

General Division I.

Marine Signals or other Means of plainly Indicating the direction in which Vessels are moving in Fog, Mist, falling Snow, and thick Weather, and at Night.

Rules for the Prevention of Collisions and Rules of the Road.

1. Visibility, number, and position of lights to be carried by vessels.

(*a.*) Steamers under way.
(*b.*) Steamers towing.
(*c.*) Vessels under way, but not under command, including steamers laying cable.
(*d.*) Sailing-vessels under way.
(*e.*) Sailing-vessels towing.
(*f.*) Vessels at anchor.
(*g.*) Pilot vessels.
(*h.*) Fishing-vessels.

2. Sound signals; their character, number, range, and position of instruments.
(*a.*) For use in fog, mist, falling snow, and thick weather, as position signals.

For steamers under way.
For steamers towing.
For sailing-vessels under way.
For sailing-vessels towing.
(These signals to show the approximate course steered if possible.)
For vessels at anchor.
For vessels under way, but not under command, including steamers laying cable.

(*b.*) For use in all weathers as helm signals only.

For steamers meeting or crossing.
For steamers overtaking.
For steamers backing.

(*c.*) Whether helm signals shall be made compulsory or remain optional.

3. Steering and Sailing Rules.
(*a.*) Sailing-vessels meeting, crossing, overtaking, or being overtaken by each other.
(*b.*) Steamers meeting, crossing, overtaking, or being overtaken by each other.
(*c.*) Sailing-vessels meeting, crossing, overtaking, or being overtaken by steamers.
(*d.*) Steamers meeting, crossing, overtaking, or being overtaken by sailing-vessels.
(*e.*) Special Rules for channels and tide-ways, where no local Rules exist.
(*f.*) Conflict of international and local Rules.
(*g.*) Uniform system of commands to the helm.
(*h.*) Speed of vessels in thick weather.

General Division II.

Regulations to determine the Sea-worthiness of Vessels.

(*a.*) Construction of vessels.
(*b.*) Equipment of vessels.
(*c.*) Discipline of crew.
(*d.*) Sufficiency of crew.
(*e.*) Inspection of vessels.
(*f.*) Uniform certificates of inspection.

General Division III.

Draft to which Vessels should be Restricted when Loaded.

Uniform maximum load mark.

General Division IV.

Uniform Regulations regardiny the Designating and Marking of Vessels.

(*a.*) Position of name on vessels.
(*b.*) Position of name of port of registry on vessels.
(*c.*) Size of lettering.
(*d.*) Uniform system of draft marks.

General Division V.

Saving Life and Property from Shipwreck.

1. Saving of life and property from shipwreck at sea.
(*a.*) Duties of vessels after collision.
(*b.*) Apparatus for life-saving to be carried on board ship. (Life-boats, life-preservers, life-rafts, pumps, and fire-extinguishing apparatus.)
(*c.*) The use of oil and the necessary apparatus for its use.
(*d.*) Uniform inspections as to (*b*) and (*c*).
2. Saving of life and property from shipwreck by operations from shore.
a.) Organization of, and methods employed by life-saving institutions.
(*b.*) The employment of drilled and disciplined crews at life-saving stations.
(*c.*) The maintenance of a patrol upon dangerous coasts by night, and during thick weather by day, for warning off vessels standing into danger, and for the early discovery of wrecks.
(*d.*) Uniform means of transmitting information between stranded vessels and the shore.
(*e.*) Life-boats, life-saving apparatus and appliances.
3. Official inquiries into causes and circumstances of shipwrecks and other casualties.

General Division VI.

Necessary Qualifications for Officers and Seamen, including Tests for Sight and Colour Blindness.

(*a.*) A uniform system of examination for the different grades.
(*b.*) Uniform tests for visual power and colour blindness.
(*c.*) General knowledge of methods employed at life-saving stations.
(*d.*) Uniform certificates of qualification.

General Division VII.

Lanes for Steamers on Frequented Routes.

(*a.*) With regard to the avoidance of steamer collisions.
(*b.*) With regard to the safety of fishermen.

General Division VIII.

Night Signals for communicating Information at Sea.

(*a.*) A code to be used in connection with the International Code Signal Book.

(*b.*) Or a supplementary code of limited scope to convey information of special importance to passing vessels.

(*c.*) Distress signals.

General Division IX.

Warnings of Approaching Storms.

(*a.*) The transmission of warnings.

(*b.*) The uniformity of signals employed.

General Division X.

Reporting, Marking, and Removing Dangerous Wrecks or Obstructions to Navigation.

(*a.*) A uniform method of reporting and marking dangerous wrecks and derelicts.

(*b.*) The division of the labour, cost, and responsibility among the several maritime nations, either by geographical apportionment or otherwise:

Of the removal of dangerous derelicts;

And of searching for doubtful dangers with a view of removing them from the Charts.

General Division XI.

Notice of Dangers to Navigation.—Notice of Changes in Lights, Buoys, and other Day and Night Marks.

(*a.*) A uniform method of taking bearings, of designating them (whether true or magnetic), and of reporting them.

(*b.*) A uniform method of reporting, indicating, and exchanging information by the several maritime nations—to include the form of notices to mariners.

(*c.*) A uniform method of distributing this information.

General Division XII.

A uniform System of Buoys and Beacons.

(*a.*) Uniformity in colour of buoys.

(*b.*) Uniformity in numbering of buoys.

General Division XIII.

The Establishment of a Permanent International Maritime Commission.

(*a.*) The composition of the Commission.

(*b.*) Its powers and authority.

Proposed Grouping of Subjects for Consideration by Committees of the International Marine Conference.

1. Rules of the road and signals—General Divisions I and VIII.

2. Saving of life and property from shipwreck by operations from shore—General Division V, Subdivision No. 2.

3. Construction and equipment of vessels, and saving of life and property from shipwreck at sea—General Divisions II, III, and IV, and Subdivision No. 1 of V.
4. Qualifications of officers and seamen—General Division VI.
5. Steam lanes—General Division VII.
6. Official inquiries into shipwrecks and other casualties—General Division V, Subdivision No. 3.
7. Transmission of warnings and information, buoys, &c.—General Divisions IX, X, XI, and XII.
8. Permanent Maritime Commission—General Division XIII.

All of which is respectfully submitted.

(Signed) S. R. FRANKLIN, *Rear-Admiral.*
W. P. SAMPSON,
Commander, United States' Navy.
S. I. KIMBALL,
General Superintendent Life-Saving Service.

*Foreign Office to Admiralty.**

Sir, *Foreign Office, May* 17, 1889.

WITH reference to the letter from this Office of the 15th March last, I am directed by the Marquis of Salisbury to transmit herewith, to be laid before the Lords Commissioners of the Admiralty, for their consideration, four copies of the programme framed by the Delegates of the United States of subjects to be considered at the International Marine Conference which is to assemble at Washington in October next.

[†I am to suggest, for the consideration of the Board, whether it might not be desirable to consult Lloyd's on the programme, as the Secretary has lately made inquiries of this Department on the subject.]

I am, &c.
(Signed) JAMES FERGUSSON.

No. 53.

The Marquis of Salisbury to Mr. White.

Sir, *Foreign Office, May* 17, 1889.

I HAVE the honour to acknowledge the receipt of your note of the 13th instant, inclosing twelve copies of the programme framed by the United States' Delegates of subjects to be considered at the International Marine Conference to be held at Washington, and I beg leave to inform you, in reply, that I have referred your note to the proper Departments of Her Majesty's Government.

I have, &c.
(Signed) SALISBURY.

* Also to Board of Trade. † To Board of Trade only.

No. 54.

Sir J. Pauncefote to the Marquis of Salisbury.—(*Received May* 28.)

My Lord, *Washington, May* 14, 1889.

WITH reference to Mr. Herbert's despatch of the 6th February, and to previous correspondence on the subject of the International Marine Conference to be held in Washington next October, I have the honour to inclose copies of the detailed programme of the subjects to be considered, which has been framed by the Board of American Delegates in accordance with instructions from the Department of State.*

Your Lordship will see from the letter (attached to the inclosure) from the President of the Board to the Secretary of State, that the correspondence on the subject between Her Majesty's Government and the United States' Government has been examined, and in conformity with the intentions of the United States' Government, as therein expressed, the consideration of the "International Code of Flag Signals" has been excluded from the programme, and a consideration of the "load-line" has been included.

In view of the great interest which is attached in this country to the meeting of this Conference, and of the very important subjects to be discussed at it, I should be much obliged if your Lordship will inform me, as early as possible, of the names of the Delegates whom Her Majesty's Government propose to send to Washington to take part in the Conference.

The copy of the programme herewith inclosed has been sent to the Legation privately, but I will endeavour to procure other copies for transmission by to-day's mail.

I have, &c.
(Signed) J. PAUNCEFOTE.

No. 55.

Foreign Office to Board of Trade.†

Sir, *Foreign Office, May* 31, 1889.

WITH reference to the letter from this Office of the 17th instant, I am directed by the Marquis of Salisbury to transmit to you, to be laid before the Board of Trade, copy of a despatch from Her Majesty's Minister at Washington,‡ inclosing copy of the detailed programme of the subjects to be considered at the International Marine Conference to be held at Washington in October.

I am, &c.
(Signed) JAMES FERGUSSON.

No. 56.

M. Catalani to the Marquis of Salisbury.—(*Received June* 11.)

(Translation.)

My Lord, 20, *Grosvenor Square, June* 7, 1889.

UNDER the auspices of the Government of the United States, there will meet at Washington in October next an International Conference convoked with a view to establish a uniform system of Rules and Signals for preventing collisions at sea.

In communicating to me the above information, the King's Government expresses a wish to know how many Delegates will represent the British Government, and what will be their rank: this information will be used to guide the Italian Government in choosing the Italian Delegates.

* See Inclosure in No. 51.

† Also to Admiralty. ‡ See No. 54

I should therefore be obliged if your Excellency, with your usual kindness, would put me in a position to answer the request made to me be my Government.

With anticipated thanks, I have, &c.

(Signed) T. CATALANI.

No. 57.

The Marquis of Salisbury to M. Catalani.

M. le Chargé d'Affaires, *Foreign Office, June* 15, 1889.

I HAVE the honour to acknowledge the receipt of your note of the 7th instant respecting the Maritime Conference at Washington, and, in reply, I beg to state that the number and rank of the British Delegates have not yet been decided on. When a decision has been come to, I shall do myself the honour to communicate it to you.

I have, &c.

(Signed) SALISBURY.

No. 58.

Admiralty to Foreign Office.—(Received June 18.)

Sir, *Admiralty, June* 15, 1889.

MY Lords Commissioners of the Admiralty have had under their consideration your letter of the 17th ultimo, forwarding copies of the programme framed by the Delegates of the United States of the subjects to be considered at the International Maritime Conference at Washington, and before replying have been in consultation with the Board of Trade on the subject.

2. In reply to your letter, and in reference to previous correspondence, my Lords request that you will state to the Marquis of Salisbury that they are of opinion that the programme is of so extensive a nature that there is no hope that any conclusion will be arrived at by the Conference within a reasonable time, seeing, especially, that each question has been a subject for argument for many years.

3. I am further to point out that the different subjects in which the Admiralty is interested would require an extension of the number of Delegates, in order that they may be discussed by officers properly acquainted with diverse technicalities.

4. My Lords are therefore of opinion (in which the Board of Trade concur) that, in the first instance, the deliberations of the Conference should be strictly confined to the consideration of General Section 1 (viz., regulations for prevention of collisions at sea), which would, from its complicated nature, and from the manner in which it is proposed to throw every detail open for discussion, afford ample food for many sittings.

5. Their Lordships would further suggest that when the discussion of this section, with its numerous subheads, has been brought to a conclusion, the question of the desirability of continuing the Conference should be considered in the light of experience, and a decision arrived at as to future action, observing that such a course would also give Her Majesty's Government an opportunity of considering whether future deliberations should not be held in England, as the country undoubtedly mostly interested in maritime matters.

I am, &c.

(Signed) EVAN MACGREGOR.

No. 59.

Board of Trade to Foreign Office.—(Received June 19.)

Sir, *Board of Trade, June* 19, 1889.

I AM directed by the Board of Trade to acknowledge the receipt of your letter of the 17th ultimo, forwarding, for their consideration, copies of the programme,

framed by the Delegates of the United States, of subjects to be considered at the International Marine Conference which is to assemble at Washington in October next.

In reply I am to state, for the information of the Marquis of Salisbury, that, as the consent of Her Majesty's Government to take part in the Conference is at present conditional on their acceptance of this programme, the Board of Trade have carefully considered it, in consultation with the Admiralty, and have arrived at the following conclusions.

While they see no reason at the present moment to object to the subjects contained in the programme as in themselves unsuitable for international discussion, the scope of the programme as a whole appears to them far too extensive to afford any prospect that the Conference would arrive at valuable conclusions on all the subjects proposed within any session of reasonable duration. They are also of opinion that if each country were to send Delegates specially qualified to discuss the various and intricate technical questions involved, it would be impossible to confine the number of the members of the Conference within convenient limits.

It should, moreover, be borne in mind that circumstances may arise at any moment during the Conference which might render the discussion of some or other of the subjects unnecessary or highly inconvenient, and that it is therefore desirable that Her Majesty's Government should not be committed to the whole programme, and that the order in which the divisions of it are taken should not be wholly at the discretion of the Conference.

For these reasons the Board of Trade would suggest, for the consideration of the Secretary of State for Foreign Affairs, that the consent of Her Majesty's Government to the programme should be provisional only; and that British Delegates should not be sent to the Conference except on the distinct understanding that (1) the proceedings will at first be strictly confined to the consideration of the subjects included in General Division 1, viz., lights and signals to be used on board ship, and Rules for the prevention of collisions at sea; and (2) that when the deliberations of the Conference on these subjects have come to an end, and before the Conference proceeds to the discussion of other questions, Her Majesty's Government will be allowed the opportunity of reviewing their position with regard to it.

They would then be in a position to send, if necessary, other Delegates specially chosen for their knowledge of the subject next selected for discussion, to suggest modifications of the programme, or even to withdraw from the Conference altogether. It might also be then a matter for consideration whether the further meetings of the Conference might not be more conveniently held at London or some other European capital.

I am to add that the Board of Trade observe with satisfaction that, as stated in your letter of the 28th January last, the Government of the United States agree that Her Majesty's Government shall not be bound by any decision to which their Representatives do not assent, but I am to point out that the opinion expressed in their letter of the 8th September last went somewhat further than this, and that they adhere to the view that Her Majesty's Government should not be bound even by the assent of their Representatives, because they consider that the Conference should rather be intrusted with the discussion and formation of international opinion than with the absolute decision of the questions referred to it. In order that this point may be quite clear, the Board of Trade think it highly desirable that the different questions before the Conference should not be put to the vote, but that the opinions of the Delegates of each country should be simply recorded, and regarded as strictly *ad referendum*.

I have, &c.
(Signed) HENRY G. CALCRAFT.

No. 60.

Sir G. Baden-Powell, M.P., to Foreign Office.—(*Received June* 20.)

Dear Sir James, *House of Commons, June* 17, 1889.

RECENTLY I had had many communications from my constituents in Liverpool and many others connected with shipping as to the matters about to be

discussed, and perhaps adjudicated upon, at the forthcoming Maritime Conference in Washington, and as to the probable action of Her Majesty's Government.

I have drawn up the inclosed Memorandum on the subject, hoping it may be of some service. I think all shipping constituencies would be much pleased to think that represention from them in the matter would be cordially attended to.

I am sending a copy of the Memorandum to the Board of Trade, but inclose for you a copy of my pamphlet on territorial waters.

Believe me, &c.

(Signed) GEORGE BADEN-POWELL.

Inclosure in No. 60.

Memorandum on Proposed Maritime Conference at Washington, 1889.

IN view of the International Maritime Conference which is announced to be held in Washington in the autumn of 1889, it may be well to set out in detail the subjects with which that Conference may deal, and the points on which it might be desirable to have beforehand the opinions of the great shipping interests of the United Kingdom.

2. Authority, jurisdiction, and legalized regulations must, sooner or later, be set up on the high seas in a form more palpable and uniform than has hitherto prevailed.

Oversea intercourse has developed in a very remarkable degree, partly owing to the growth of new populations in America, Australia, and other distant lands, and partly to the substitution of steam for wind as the motive power, with the consequent increase in the certainty, speed, safety, and number of voyages.

The actual results are best seen in the records of the gross tonnage using the high seas:—

Year.	Tonnage.		
	Total.	Sailing.	Steam.
	Tons.	Tons.	Tons.
1850	7,100,000	6,900,000	200,000
1860	11,500,000	10,750,000	750,000
1888	18,000,000	10,500,000	7,500,000

3. The results of a Maritime Conference are of the highest importance to the British Empire, because British ships outnumber those of all other nations added together, whereas at an International Conference a Convention may be agreed to by a majority of States of a character greatly damaging to British shipping, even though the United Kingdom stand aloof.

4. In recent years many matters of jurisdiction or action on the high seas have been in dispute; as fishery rights, civil and criminal jurisdiction, salvage, right of search, rule of the road, and other matters; in all of which it is to the general interest of British shipping that full equality and reciprocity should rule among ships of all nationalities.

5. With reference to matters which may be brought before the International Maritime Conference, there are many bearing upon the prevention of loss of life and property, or establishing uniformity in the navigation and equipment of vessels on the high seas.

6. The following is a list of detailed subjects which have been named as proper for discussion at the approaching Conference:—

(A.)—*Casualties.*

i. Log entries of casualties: to be on uniform plan.

ii. Legal inquiries: put end to existing varieties of procedure, rules of evidence, &c.

iii. Helm orders: to be on one instead of two systems.

iv. Lights, including those for fishing and pilot vessels.

v. Signals in fog, and for distress day and night.

vi. Rule of the road on high seas and in narrow waters.
vii. Ocean routes: *e.g.*, Maury's Lanes.
viii. Life-saving appliances on board.
ix. Passenger regulations, number to be carried, &c.
x. Crew: adequate number, competency.
xi. Officers: number, certificates of competency.
xii. Hull: seaworthiness, safety bulkheads.
xiii. Machinery: condition, power, inspection.
xiv. Cargo: over-loading, stowage (grain).
xv. Derelicts and floating wreckage, power to destroy.
xvi. Salvage regulations.

(B.)—*General Points.*

i. Flag: right to carry national colours.
ii. Transfer to other flag, for unseaworthiness, in war-time, &c.
iii. Marking name, port, draught, &c.
iv. Tonnage measurement (present systems may differ by 15 to 50 per cent. in steamers).
v. Estates of deceased seamen.
vi. Accommodation of shipwrecked crews.
vii. Deserters from merchant-ships.
viii. Boarders and runners.
ix. Jurisdiction in civil cases (*e.g.*, pilots).
x. Communication at sea: signals.
xi. General police: as in North Sea fisheries.

(C.)—*General Rights.*

i. Right of search (*e.g.*, starboarding).
ii. Right to fish, including whaling, sealing, &c.
iii. Private property at sea in war-time.
iv. Uniformity in buoyage systems.
v. Uniformity in commercial law (*e.g.*, general average, bills of lading, &c.).
vi. Uniformity in compiling statistics.
vii. Rendering all International Rules in some one language on which to base judgments (so avoiding mistranslations, as in the case of the "City of Mecca").

7. Many of these matters have already been discussed, and in many cases partial or more complete International Agreement has been come to, as, for instance, in regard to "rule of the road," lights, signals of distress, and tonnage measurement. The Imperial Government would early decide on the limits of the programme it would agree to discuss.

8. The Conference would also take into consideration the means by which any International Agreement would be ratified, as—

i. Simultaneous and identic legislation.
ii. International Conventions.
iii. A permanent International Commission, acting through its own Bureau.

9. Many valuable indications are contained in the numerous Treaties and Conventions, and the records of Conferences, as, for instance, that held at Antwerp on Commercial Law, 1885; at London on International Law, 1887; at London on Colonial Affairs, 1887; and the Maritime Conferences at Gothenburg, 1883, and Copenhagen, 1888.

10. It may be suggested that a small Committee or Commission of, say, three qualified authorities, might be forthwith appointed to collect and collate, confidentially if desirable, the opinions and requirements of British shipping interests, on the points likely to come before the proposed Maritime Conference.

(Signed) GEORGE BADEN-POWELL.

June 15, 1889.

No. 61.

The Marquis of Salisbury to Sir J. Pauncefote.

Sir, *Foreign Office, June* 22, 1889.

HER Majesty's Government have carefully considered the programme of the discussions of the Maritime Conference which is to be held at Washington during the coming autumn, copies of which programme were inclosed in your despatch of the 13th ultimo.

You will have perceived from the inclosures in my despatch of the 24th January last, to Mr. Herbert, that the consent of Her Majesty's Government to take part in the Conference is as yet conditional on their acceptance of the programme. While they do not see any reason at the present moment to object to the subjects contained in the programme, as in themselves unsuitable for international discussion, the scope of the programme appears to them far too extensive to afford any prospect that the Conference would arrive at valuable conclusions on all the subjects proposed within any session of reasonable duration. They are also of opinion that if each country were to send Delegates specially qualified to discuss the various and intricate technical questions involved, it would be impossible to confine the number of the members of the Conference within convenient limits.

It should, moreover, be borne in mind, that circumstances may arise at any moment during the Conference which might render the discussion of some or other of the subjects unnecessary or highly inconvenient, and that it is therefore desirable that Her Majesty's Government should not be committed to the whole programme, and that the order in which the divisions of it are to be taken should not be wholly at the discretion of the Conference.

For these reasons, the assent of Her Majesty's Government to the programme can be but provisional, and they will not be able to send British Delegates to the Conference except on the distinct understanding (1) that the proceedings will at first be strictly confined to the consideration of the subjects included in General Division I, viz., lights and signals to be used on board ship, and Rules for the prevention of collisions at sea; and (2) that when the deliberations of the Conference on these subjects have come to an end, and before the Conference proceeds to the discussion of other questions, Her Majesty's Government will be allowed the opportunity of reviewing their position with regard to it.

They would then be in a position to send, if necessary, other Delegates, specially chosen for their knowledge of the subject next selected for discussion, to suggest modifications of the programme, or even, under certain conceivable circumstances, to abstain from taking any further part in the deliberations of the Conference.

I have to request you to address a communication to the United States' Government in the sense of this despatch. You should, at the same time, remind the United States' Government that, as stated in my despatch to Sir L. West of the 3rd October last, it was made a condition of the acceptance of Her Majesty's Government of the invitation of the United States' Government, that the British Delegates would not have power to bind Her Majesty's Government. That any proposals which they might make, and any action which the Conference might adopt or recommend, would be, *ad referendum*, only for the consideration and decision of the Government represented.

I am, &c.
(Signed) SALISBURY.

No. 64.

Admiralty to Foreign Office.—(Received June 27.)

(Extract.) *Admiralty, June* 26, 1889.

WITH reference to previous correspondence, I am commanded by my Lords Commissioners of the Admiralty to request that you will state to the Marquis of Salisbury that they have selected Rear-Admiral Sir Robert H. M. Molyneux, K.C.B., and Rear-Admiral Nathaniel Bowden-Smith, to represent the Admiralty as Delegates at the Maritime Conference to be held at Washington in October next to consider the subjects included in General Division 1 of the programme of the Conference.

No. 65.

The Marquis of Salisbury to Count Hatzfeldt.

THE Marquis of Salisbury presents his compliments to Count Hatzfeldt, and, with reference to the inquiry which his Excellency caused to be made respecting the nomination of British Delegates to the proposed Maritime Conference at Washington, has the honour to state that the Lords of the Admiralty have selected Rear-Admiral Sir Robert H. M. Molyneux, K.C.B., and Rear-Admiral Nathaniel Bowden-Smith to represent the Admiralty on this occasion.

Lord Salisbury has not been informed as yet of the nominations made by the Board of Trade.

No. 67.

Board of Trade to Foreign Office.—(Received July 10.)

(Extract.) *Board of Trade, July 9, 1889.*

WITH reference to previous correspondence respecting the proposed Maritime Conference at Washington, I am directed by the Board of Trade to state, for the information of the Marquis of Salisbury, that they have decided to nominate Mr. Thomas Gray, C.B. (Assistant Secretary of the Marine Department, Board of Trade); Mr. Charles Hall, Q.C., M.P.; Captain Wyatt (of the Peninsular and Oriental Company's Service); and Captain Edmund Richard Peel (a member of the Liverpool Local Marine Board), to be the Delegates to represent the Board of Trade at the Conference.

No. 68.

Foreign Office to Treasury.

(Extract.) *Foreign Office, July 15, 1889.*

I AM directed by the Marquis of Salisbury to request that you will lay before the Lords Commissioners of Her Majesty's Treasury the correspondence herewith inclosed* respecting an International Marine Conference to be held at Washington in October next. The object and scope of this Conference is fully set forth in Mr. Phelps' note and inclosures of the 14th August last, and also in the detailed programme of subjects to be discussed, which has since been communicated to Her Majesty's Government, and is herewith inclosed.

The recent communications which have passed between this Office, the Board of Trade, and Admiralty (the Departments of Her Majesty's Government primarily interested in the proceedings of this Conference), have resulted in instructions being addressed to Her Majesty's Minister at Washington, copy of which is herewith inclosed.

No. 69.

The Marquis of Salisbury to Count Hatzfeldt.

THE Marquis of Salisbury presents his compliments to Count Hatzfeldt, and, with reference to his note of the 2nd instant, has now the honour to inform his Excellency that it is proposed that the Board of Trade shall be represented at the Marine Conference, to be held at Washington in October next, by Mr. Thomas Gray, C.B., Assistant Secretary, Marine Department, Board of Trade; Mr. Charles Hall, Q.C., M,P.; and two officers of the merchant navy.

It is, however, possible that so full a representation may not be ultimately carried out.

Foreign Office, July 16, 1889.

No. 70.

The Marquis of Salisbury to M. Catalani.

M. le Chargé d'Affaires, *Foreign Office, July 16, 1889.*

WITH reference to my note of the 15th ultimo, I have now the honour to inform you that it is proposed that the British Board of Admiralty, at the forthcoming Marine Conference at Washington, shall be represented by Rear-Admiral Sir Robert H. M. Molyneux, K.C.B., and Rear-Admiral Nathaniel Bowden-Smith; and the Board of Trade by Mr. Thomas Gray, C B., Assistant Secretary to the Marine Department of that Office; Mr. Charles Hall, Q.C., M.P., who is a leading Counsel in marine cases; and two officers of the merchant service.

It is, however, possible that so full a representation may not be finally sanctioned.

I have, &c.
(Signed) SALISBURY.

No. 71.

*Foreign Office to Admiralty.**

Sir, *Foreign Office, July* 19, 1889.

IN reply to your letter of the 26th ultimo, I am directed by the Marquis of Salisbury to request that you will inform the Lords of the Admiralty that his Lordship has caused a communication to be made to the Lords of the Treasury respecting the expenses of the Delegates to the International Maritime Conference to be held at Washington.

I am, &c.
(Signed) JAMES FERGUSSON.

No. 72.

Board of Trade to Foreign Office.†—(Received July 20.)

(Extract.) *Board of Trade, July* 19, 1889.

WITH reference to previous correspondence on the subject of the proposed Maritime Conference at Washington, I am directed by the Board of Trade to acquaint you, for Lord Salisbury's information, that Captain Peel intimates that he is unable to serve on the Conference, and that the Board have therefore appointed Captain T. G. Kendall, of the City of Dublin Steam Packet Company.

No. 73.

Treasury to Foreign Office.—(Received July 26.)

(Extract.) *Treasury Chambers, July* 25, 1889.

THE Lords Commissioners of Her Majesty's Treasury have had before them your letters of the 15th and 20th‡ instant respecting the representation of the United Kingdom at the proposed International Marine Conference at Washington.

As regards the number of British Delegates—

The Admiralty name two: Rear-Admiral Sir H. M. Molyneux, K.C.B.; Rear-Admiral N. Bowden-Smith.

The Board of Trade name four: Mr. T. Gray, C.B., Assistant Secretary, Marine Department; Mr. Charles Hall, Q.C., M.P.; Captain Wyatt, of the Peninsular and Oriental Company's service; Captain Kendall, of the City of Dublin Steam Packet Company.

My Lords presume that this large number is thought necessary, although the programme of the Conference is to be confined, in the first instance, to the subjects mentioned in Division I, because the United States will have six Representatives. The Foreign Office alone can judge whether it would not be practicable to arrange that no country should have more than three or four Delegates at a time, with a view to reducing the cost.

No. 74.

Board of Trade to Foreign Office.—(Received July 31.)

Sir, *Board of Trade, July* 30, 1889.

WITH reference to previous correspondence concerning the proposed International Maritime Conference at Washington, I am directed by the Board of Trade to state, for the information of the Marquis of Salisbury, that they have selected Admiral Sir G. S. Nares, K.C.B., to act as an additional Representative of this Department at the Conference in question.

I have, &c.
(Signed) HENRY G. CALCRAFT.

(Telegraphic.) *Berlin, August* 3, 1889, 6·25 P.M.

WASHINGTON Marine Conference.

Views of German Government are identical with those of Her Majesty's Government, with one exception. They will send expert Delegates, probably four in number. They regard subjects for discussion as technical rather than political. Their Delegates will not be Plenipotentiaries, and their Minister will not take part in the Conference. But they cannot make condition as to confining deliberations to first section of programme, as they have accepted entire programme for discussion by their Delegates *ad referendum*.

No. 79.

The Earl of Lytton to the Marquis of Salisbury.—(Received August 5.)

(Extract.) *Paris, August* 3, 1889.

WITH reference to your telegram of yesterday's date, M. Clavery, the Director of the Commercial Department of the French Foreign Office, informs me that the French Government share generally the views held by Her Majesty's Government with regard

to the technical rather than political character of the Maritime Conference it is proposed to hold at Washington.

M. Clavery stated that the French Government had originally intended only to send a naval officer of high rank and a merchant captain to represent France at the Conference; but that, having heard from M. Waddington that it was the intention of the British Admiralty to send two superior naval officers, and that the Board of Trade intended to send two, if not three, representatives (two experts and one lawyer), the French Government would send a competent lawyer to accompany the experts, who would not in any case be Plenipotentiaries.

Sir Clare Ford to the Marquis of Salisbury.—(Received August 5.)

(Telegraphic.) *Madrid, August 5, 1889.*

WASHINGTON Marine Conference.

Spanish Government regard Conference as of a purely technical character, and have named two naval officers as Delegates, who will report result of deliberations. They have made no reserve with regard to programme such as proposed by Her Majesty's Government.

Spanish Minister will not take part in Conference unless Representatives of other Powers be directed to do so.

No. 81.

Mr. Dering to the Marquis of Salisbury.—(Received by telegraph August 5.)

(Extract.) *Rome, August 5, 1889.*

ON the receipt of your Lordship's telegram of the 2nd instant, I addressed a note to Signor Crispi, copy of which I have the honour to inclose, and stated that I would call at the Foreign Office to-day, in hopes of being able to inform your Lordship of the views of the Italian Government as to sending technical Delegates to the Maritime Conference at Washington, with instructions to refer the result of their deliberations to their Government for consideration instead of acting as Plenipotentiaries.

I was to-day informed by Signor Crispi's Confidential Secretary that the wish of the Italian Government was to adopt the course taken by that of Her Majesty, who had far greater interests in it than themselves. They would propose accordingly to send technical Delegates in the manner suggested by your Lordship, with instructions to refer home for consideration the result of their deliberations, and they would not instruct their Minister to take part in the Conference unless other Powers should do so.

Signor Mayor promised me that an official communication to the above effect should be forwarded to me without delay.

Inclosure in No. 81.

Mr. Dering to Signor Crispi.

M. le Ministre, *Rome, August 2, 1889.*

AS your Excellency is aware, a Commercial Maritime Conference is shortly to be held at Washington. I am instructed by the Marquis of Salisbury to inform your Excellency that Her Majesty's Government, regarding the subjects for discussion as technical rather than political, have expressed their readiness to send expert Delegates, on the condition that the deliberations will in the first instance be confined to the first sections of the programme, and will then be submitted to Her Majesty's Government for approval. The Delegates will therefore not be Plenipotentiaries.

To this proposal the Government of the United States have not yet replied.

Her Majesty's Government do not propose that their Minister shall take part in the Conference unless the Representatives of other Powers be also directed to do so, and I shall be glad if your Excellency will enable me to inform Lord Salisbury with as little delay as possible what is the view of the Italian Government on this subject.

I avail, &c.

No. 82.

Sir F. Plunkett to the Marquis of Salisbury.—(*Received August* 6.)

(Telegraphic.) *Stockholm, August* 5, 1889.

REFERENCE to your Lordship's telegram of 2nd instant.

This Government send three technical Delegates to the Washington Marine Conference, but their Minister at Washington will not take any part, and everything will have to be submitted home here for approval. They have made no reserve with regard to programme, and are willing to discuss the whole.

No. 83.

Sir F. Plunkett to the Marquis of Salisbury.—(*Received August* 8.)

My Lord, *Stockholm, August* 5, 1889.

ON the receipt of your Lordship's telegram of the 2nd instant, I called upon Count Guldenstolpe, who is acting temporarily as Secretary-General of the Foreign Department, and is in charge during the absence, on leave, of Baron Akerhielm and M. de Bildt.

I informed Count Guldenstolpe that Her Majesty's Government regard the subjects proposed for discussion at the Marine Conference about to be held in Washington as having more of a technical than a political character, and have expressed their readiness to send expert Delegates, on the condition that the deliberations will in the first instance be confined to the first section of the programme, and will then be submitted to Her Majesty's Government for approval.

I explained that these expert Delegates would not be Plenipotentiaries, and that Her Majesty's Minister at Washington would not take part in the Conference unless the Representatives of other foreign Powers were instructed to do so.

I then inquired what action the Swedish-Norwegian Government would take in this matter.

Yesterday Count Guldenstolpe informed me that the Swedish-Norwegian Government concurred in the view taken by Her Majesty's Government, that the subjects for discussion were of a technical rather than of a political character. Their Minister at Washington had therefore not been instructed to take part in the Conference, and technical Delegates only had been named. Sweden would send a navy captain only, but Norway would send both a navy captain and a marine insurance agent.

These gentlemen have no authority to agree to anything, but must submit everything to the decision of the home Government.

Sweden and Norway have made no reserve with regard to the programme suggested for the deliberations of the Conference, and are ready to discuss it as proposed.

I have, &c.
(Signed) F. R. PLUNKETT.

YOUR telegram of the 13th: Marine Conference.

Send summary of United States' considerations therein referred to by telegraph.

No. 89.

Mr. Dering to the Marquis of Salisbury.—(Received August 17.)

My Lord, *Rome, August 14, 1889.*

WITH reference to my despatch of the 5th instant, I have the honour to forward herewith translation of a note which I have this day received from the

Italian Government in confirmation of the telegram which I was authorized to forward to your Lordship on that day concerning the Marine Conference at Washington.

Your Lordship will perceive therefrom that while the Italian Government are quite prepared to conform their action in all ways in the matter to that of Her Majesty's Government, they would be glad to be informed, with the view of preparing instructions for their Delegate, of the grounds upon which your Lordship considers it desirable that Delegates should in the first instance confine their deliberations to the first section of the programme.

His Excellency further expresses the wish to be informed of the reply of the United States' Government to that of Her Majesty as soon as it shall have been received.

I have, &c.
(Signed) HENRY NEVILL DERING.

Inclosure in No. 89.

Signor Damiani to Mr. Dering.

(Translation.)
M. le Chargé d'Affaires, *Rome, August* 13, 1889.

IN your note of the 2nd instant you were good enough to inform me that the British Government, regarding the subjects for discussion at the forthcoming Commercial and Maritime Conference at Washington as technical rather than political, have expressed their intention of sending as their Representatives one or more experts, on condition that the deliberations of the Conference shall be submitted to Her Majesty's Government for approval; thus the English Delegates will not be Plenipotentiaries.

Further, the Cabinet of St. James' do not propose that the British Minister in Washington shall take part in the Conference unless in the event of the Representatives of the other Powers receiving instructions to do so.

I hasten to inform you that the Italian Government on this point agree entirely with the view of the Cabinet of London, as Italy also will be represented at the Conference, not by His Majesty's Minister at Washington, or by a Plenipotentiary, but simply by an expert, who has already been appointed.

As regards the programme of the Conference referred to in your above-mentioned note, the Government of His Majesty have not, up to the present time, had occasion to give special instructions to its Delegates; but they will willingly examine whether it would not be better to decide that the deliberations of the Conference shall be limited to one part only of the proposed programme.

Wishing to proceed, on this point also, in accord with Her Majesty's Government, I should be obliged if you would procure me fuller and more precise information concerning the limitations which, according to the Cabinet of St. James', would be proposed in this respect, and the reasons which, in their opinion, would recommend these limitations. I should further be grateful if you would let me know in due time the reply which the Government of the United States makes to the communication addressed to them by the British Government.

(Signed) DAMIANI, *Under-Secretary of State.*

No. 90.

Mr. Edwardes to the Marquis of Salisbury.—(*Received August* 20, 8 A.M.)

(Telegraphic.) *Newport* (*Rhode Island*), *August* 20, 1889.

YOUR telegram of 16th respecting Marine Conference.

Secretary of State's note calls the attention of Her Majesty's Government to following considerations:—

In note of 24th January to United States' Minister in London, Lord Salisbury accepted the invitation of the Government of the United States, subject to two reservations:

1. Her Majesty's Government will not be bound by any vote to which the British Delegate had not assented; and

2. The questions to be submitted to the Conference were to be agreed upon beforehand by the Governments taking part in it.

These reservations were agreed to by the note of the United States' Chargé d'Affaires in London of the 12th March. That note further stated that the Government of the United States understood that a representation of all the Powers *ad referendum* would be satisfactory. The Governments who had accepted the invitation appointed their Delegates on that understanding. The United States' Government entirely agree with the statement contained in Sir L. West's note to the United States' Secretary of State of the 22nd October last, from the words "should Her Majesty's Government be represented," down to "decision of the Government represented."

As this is the distinct understanding as to the effect of the participation of Her Majesty's Government in the Conference, and as it is also understood that the programme of the United States' Delegates is suggestive only, the Government of the United States' think that the first and third objections raised in the note of Her Majesty's Minister might be submitted by Her Majesty's Government through their Delegates for the consideration of the Conference in the preliminary proceedings.

In connection with the *ad referendum* character of the Conference, it is particularly to be noted, with reference to the third objection raised by Her Majesty's Government, that it does not appear that the Delegates of any Government need discuss subjects which in their opinion are unnecessary or inconvenient. It is also observed, with reference to the second objection, that all the subjects suggested in the programme are analogous in their nature, and that those in General Divisions 1 to 4 inclusive, 6 to 8 inclusive, and 10 to 17 inclusive, are matters with which all practical seamen are conversant, with exception of that of construction; the subjects in General Divisions 5 and 9, however, would require special knowledge.

The Government of the United States have appointed seven Delegates, viz., four practical seamen, one expert in life-saving, one Admiralty lawyer, and one President of a Steam-ship Company. Her Majesty's Government are at liberty to appoint as many Delegates as they think proper.

The United States' note concludes as stated in my telegram of the 13th.

No. 91.

Foreign Office to Board of Trade.

Sir, *Foreign Office, August* 21, 1889.

I AM directed by the Marquis of Salisbury to forward the inclosed copy of a telegram from Her Majesty's Chargé d'Affaires at Washington,* for the information of the Board of Trade, and to suggest that a telegram to the following effect should be addressed to Mr. Edwardes:—

He should be informed that, as the date fixed for the meeting of the Maritime Conference is too near to permit a full discussion of the matters raised in the reply of the United States, and in order to avoid the inconvenience to other Powers which might be caused by a postponement of the day of meeting, Her Majesty's Government will refrain from any further observations which may be necessary upon the order of proceeding until the Conference has assembled. Their Delegates will then indicate the reserves which it will be their duty to make in regard to certain subjects which appear in the later portion of the programme.

The assurance of the Government of the United States that they fully concur in the statements contained in the last two paragraphs of Sir L. West's despatch of the 22nd October, 1888, is quite satisfactory.

I am, &c.
(Signed) JAMES FERGUSSON.

No. 92.

Mr. Edwardes to the Marquis of Salisbury.—(*Received August* 23.)

My Lord, *Washington, August* 12, 1889.

ON receipt of your Lordship's despatch of the 22nd June last, Sir Julian Pauncefote addressed a note to the Secretary of State, a copy of which I have the

* No. 90.

honour to inclose, setting forth the understanding on which Her Majesty's Government would consent to take part in the International Marine Conference to be held in Washington during the autumn.

On the 2nd instant I received your Lordship's telegram inquiring whether the United States' Government agreed to that understanding, and I accordingly addressed a letter to Mr. Wharton, Assistant Secretary at the Department of State, begging him to enable me to forward as early as possible the information desired by Her Majesty's Government.

On the 7th instant I had the honour to report to your Lordship, by telegraph, that Mr. Wharton had informed me unofficially that the United States' Government could not agree to the understanding presented by Her Majesty's Minister in his note of the 12th ultimo. Mr. Wharton added that the official reply of the United States' Government to Sir Julian Pauncefote's note should be sent to me later, and it reached me two days ago. I have the honour to inclose herewith a copy thereof.

The reply of the United States' Government commences by citing the reasons set forth in the note of Her Majesty's Minister why Her Majesty's Government are unwilling to accept unconditionally the programme of subjects suggested for discussion at the Conference, and the conditions on which Her Majesty's Government would be willing to send Delegates to the same.

The Secretary of State goes on to say that, after careful consideration of the objections made by Her Majesty's Government which have induced them to give only a provisional assent to the programme of the Conference, the United States' Government, in view of all the circumstances surrounding the inception of the Conference and of the advanced stage of the preparations for its meeting, are constrained to express themselves as unable to consent to the conditions presented in Sir Julian Pauncefote's note above referred to.

Mr. Blaine then proceeds to review the communications on the subject which passed between Her Majesty's Government and the United States' Legation in London in the month of January last, and between Lord Sackville and Mr. Bayard anterior to that date, reiterating, for the consideration of Her Majesty's Government, explanations with regard to the programme of the Conference; and he states, in conclusion, that if, upon a review of the considerations presented in his note, Her Majesty's Government find it possible to waive their objections set forth in the note of Sir Julian Pauncefote to the Secretary of State, and conclude to send Delegates to the Conference, it will be a subject of much gratification to the Government of the United States, who are most desirous to secure the attendance and co-operation in the Conference of the Representatives of Her Majesty's Government, a Government who, above all others, have, in the past, manifested such great interest and effected so much in the direction of the deliberations of the coming Conference.

I have, &c.

(Signed) H. G. EDWARDES.

Inclosure 1 in No. 92.

Sir J. Pauncefote to Mr. Blaine.

Sir, *Washington, July* 12, 1889.

WITH reference to previous correspondence in relation to the International Marine Conference to be held in Washington during the autumn, I have the honour to inform you that I have received instructions from the Marquis of Salisbury to make the following communication to you.

As you are aware, the consent of Her Majesty's Government to take part in the Conference was given conditionally, and on the understanding that their representation thereat should be *ad referendum*, and that the programme of the subjects to be discussed should be previously communicated to them, and should meet with their acceptance. This appears from Lord Sackville's note of the 22nd October last, and from the reply of the State Department dated the 24th of the same month.

Her Majesty's Government have now carefully considered the programme of discussions, and, while they do not consider the subjects contained in it as in themselves unsuitable for international discussion, the scope of the programme appears to them far too extensive to afford any prospect that the Conference would arrive at valuable conclusions on all the subjects proposed within any session of reasonable duration.

They are also of opinion that, if each country were to send Delegates specially

qualified to discuss the various and intricate technical questions involved, it would be impossible to confine the number of the members of the Conference within convenient limits.

Her Majesty's Government also think it possible that circumstances may arise at any moment during the Conference which might render the discussion of some or other of the subjects unnecessary or highly inconvenient; they are therefore unwilling to be committed to the whole programme, and would consider it undesirable that the order in which the divisions of it are to be taken should be wholly at the discretion of the Conference.

For these reasons, Her Majesty's Government can only give their provisional assent to the programme, and, before they can engage to send British Delegates to the Conference, they would be glad if the United States' Government would consent that the proceedings should be at first strictly confined to the consideration of the subjects included in General Division I, viz., lights and signals to be used on board ship, and rules for the prevention of collisions at sea; and that when the deliberations of the Conference on these subjects have come to an end, and before the Conference proceeds to the discussion of other questions, Her Majesty's Government should be allowed an opportunity of reviewing their position with regard to it.

Her Majesty's Government would then be in a position to send, if necessary, other Delegates, specially chosen for their knowledge of the subject next selected for discussion, to suggest modifications of the programme, or even, under certain conceivable circumstances, to abstain from taking any further part in the deliberations of the Conference.

I should be much obliged if you would be good enough to inform me as early as may be convenient whether the conditions upon which Her Majesty's Government are prepared to send Delegates to the Conference are acceptable to your Government.

I have, &c.

(Signed) JULIAN PAUNCEFOTE.

Inclosure 2 in No. 92.

Mr. Blaine to Mr. Edwardes.

Sir, *Department of State, Washington, August* 8, 1889.

I HAVE the honour to acknowledge the receipt of the note of Sir J. Pauncefote of the 12th ultimo, relating to the International Marine Conference to be held in this city during the coming autumn. In that note Sir Julian informs the Secretary of State that he is instructed by the Marquis of Salisbury to communicate to the Government of the United States that Her Majesty's Government, while not considering the subjects contained in the programme of subjects to be discussed by the Conference as in themselves unsuitable for international discussion, are unwilling to accept unconditionally the programme suggested, for the following reasons:—

1. That the scope of the programme is too extensive to afford any prospect that the Conference would arrive at valuable conclusions on all the subjects proposed within any session of reasonable duration.

2. That, if each country were to send Delegates specially qualified to discuss the various and intricate technical questions involved, it would be impossible to confine the number of the members of the Conference within convenient limits.

3. That circumstances might arise at any moment during the Conference which might render the discussion of some or other of the subjects unnecessary or highly inconvenient, and therefore it is undesirable that the order in which the several divisions of the programme should be taken up should be wholly at the discretion of the Conference.

In view of the above objections, Her Majesty's Government, before engaging to send British Delegates to the Conference, express themselves desirous that the United States' Government should consent—

1. That the proceedings of the Conference be at first strictly confined to the consideration of subjects included in General Division I.

2. That when the deliberations of the Conference on those subjects have come to an end, and before the Conference proceeds to the discussion of other questions, Her Majesty's Government should be allowed the opportunity of reviewing their position in regard to it.

The Government of the United States have given careful consideration to all the

objections presented by Her Majesty's Government which have induced that Government to give only their provisional assent to the programme of the Conference.

The Government of the United States are exceedingly desirous of removing, if possible, all obstructions in the way of an unconditional acceptance by Her Majesty's Government of the invitation to send Delegates to the Conference, in order that the Conference in its deliberations may have the exceedingly valuable advice and counsel of Her Majesty's Representatives. But the United States' Government, in view of all the circumstances surrounding the inception of the Conference, and considering also the present advanced stage of the preparations for its meeting, are constrained to express themselves as unable to consent to the conditions presented in Sir J. Pauncefote's note above referred to.

It is proper in this connection to draw the attention of Her Majesty's Government with reference to the first and third objections suggested in Sir J. Pauncefote's communication to the following considerations.

The Marquis of Salisbury, in his note to Mr. Phelps of the 24th January, 1889, stated that Her Majesty's Government accepted the invitation of the United States' Government to the proposed Conference, subject to two reservations:—

1. That Her Majesty's Government will not be bound by any vote to which Her Majesty's Representative at the Conference has not assented; and

2. That the particular questions to be submitted to the Conference shall be agreed upon beforehand by the Governments to take part in it.

These reservations were assented to by the Government of the United States in a note from Mr. White, at that time Chargé d'Affaires in London, to the Marquis of Salisbury, dated the 12th March, 1889. In that note Mr. White said that he was authorized by the Government of the United States to state that the understanding of his Government had been that a representation of all the Powers *ad referendum* would be entirely satisfactory. It is with this understanding that the Government of the countries which have already accepted the invitation to take part in the Conference have intimated their readiness to send Delegates, and in many instances have already appointed them.

The Government of the United States agree entirely with the statement made in the note of Lord Sackville to Mr. Bayard dated the 22nd October, 1888, that, "should Her Majesty's Government be represented, it must of course be understood that, as is the constant practice at technical Conferences of this nature, Great Britain will be represented by Delegates who will not have power to bind Her Majesty's Government. Any proposals which the British Delegates make, and likewise any action which the Conference may adopt or recommend, would, in the usual course, be *ad referendum* only for the consideration and decision of the Government represented."

This being the distinct understanding of the effect of a participation by Her Majesty's Government in the deliberations of the Conference, and it being, moreover, as distinctly understood that the programme presented by the Delegates of the United States is suggestive only, so far as the Conference is concerned, and subject to be dealt with by the Conference in such manner as it shall determine, it is suggested by the Government of the United States that the first and third objections presented in Sir J. Pauncefote's note are such as Her Majesty's Government might submit to the Conference, through its Delegates, for the consideration of the Conference in its preliminary proceedings held in the determination of its final programme; and it is particularly to be noted in connection with the *ad referendum* character of the conclusions of the Conference, that, so far as the third objection of Her Majesty's Government is concerned, it does not appear that it will be incumbent upon the Delegates of any Government to take part in the discussion of any subject which is thought by them to be unnecessary or inconvenient to discuss.

It is also to be observed in connection with the second objection in Sir J. Pauncefote's note that all the subjects suggested in the programme of the United States' Delegates are analogous in their nature, and that the subjects in General Divisions from I to IV inclusive, VI to VIII inclusive, and X to XIII inclusive, are all matters with which practical seamen must be held to be thoroughly conversant, excepting the subject of construction, which would require special expert knowledge. The subjects in General Divisions V and IX would also, it is conceived, require special information. The Government of the United States intend to be efficiently and capably represented in the Conference, and to this end have appointed seven Delegates, four of whom are practical seamen, one an expert in life saving, one an Admiralty lawyer, and one the President of a Steam-ship Company. Moreover, the number of Delegates which may be appointed by any Government is unlimited, and

Her Majesty's Government may be represented by as many Delegates as may seem to them convenient.

If, upon a review of the considerations above presented, Her Majesty's Government find it possible to waive their objections set forth in the note of Sir J. Pauncefote to the Secretary of State, and conclude to send Delegates to the Conference, it will be a subject of much gratification to the Government of the United States, who are most desirous to secure the attendance and co-operation in the Conference of the Representatives of Her Majesty's Government, a Government who above all others have in the past manifested such great interest and effected so much in the direction of the deliberations of the coming Conference.

I have, &c.
(Signed) W. F. WHARTON.

No. 93.

Board of Trade to Foreign Office.—(Received August 23.)

Sir, *Board of Trade, London, August 22, 1889.*

I AM directed by the Board of Trade to acknowledge the receipt of your letter of yesterday's date (as corrected by your communication of to-day), and to state that the Board of Trade concur in the terms of the telegram which it is proposed to send to Her Majesty's Chargé d'Affaires at Washington in reply to his communication respecting the International Maritime Conference which is to assemble there in October next.

The Board of Trade desire me, at the same time, to suggest, for the consideration of the Marquis of Salisbury, that the British Delegates should be instructed to state, when the Conference has assembled, that they are only authorized to discuss General Division I of the detailed programme prepared by the United States' Delegates, and that Her Majesty's Government reserve to themselves the right, when the deliberations of the Conference on the subjects included in this Division have come to an end, of reviewing their position with regard to the Conference.

I have, &c.
(Signed) HENRY G. CALCRAFT.

No. 94.

The Marquis of Salisbury to Mr. Edwardes.

(Telegraphic.) *Foreign Office, August 23, 1889, 4 P.M.*

YOUR telegram of 20th respecting the Maritime Conference.

The date given for the meeting being too near to allow of full discussion of the questions raised in the answer of the United States' Government, and as inconvenience might be caused to other Powers by postponing the date of meeting, Her Majesty's Government will not make any further observations which they may consider to be necessary upon the order of procedure until the Conference shall have assembled. The British Delegates will then state the reservations which it will be their duty to make respecting certain subjects which appear in the latter part of the programme.

Her Majesty's Government consider the assurance given by the United States' Government that they fully concur in the statements contained in the last two paragraphs of Sir L. West's despatch of the 22nd October, 1888, to be quite satisfactory.

Answer United States' Government in this sense.

No. 95.

The Marquis of Salisbury to Mr. Dering.

(Telegraphic.) *Foreign Office, August 24, 1889, 5·30 P.M.*

YOUR telegram of 14th.

British Delegates will attend Maritime Conference at date fixed by United States, and will then make reserves as to later portions of programme. They will act *ad referendum* only.

No. 100.

Mr. C. Hall, M.P., to Foreign Office.—(*Received September* 2.)

MR. CHARLES HALL presents his compliments to Sir Philip Currie, and begs to acknowledge the receipt of his letter of the 27th ultimo, inclosing the draft instructions to the British Delegates to the Maritime Conference. Mr. Hall begs to call Sir Philip Currie's attention to the suggestions he has made in the margin of the draft which he returns herewith. Mr. Hall would point out that this is the first intimation which he, and, so far as he is aware, any of the Delegates, has received that the question of the draught to which vessels should be restricted when loaded (General Division No. III) is to be discussed by the British Delegates, and he would suggest that notice should be given as early as possible, not only to the Delegates, but to all the members of the Committee appointed to inquire into the matters intended to be raised at the Conference, that this question is to be discussed by the Delegates, so that data and information upon this point may be prepared for the next meeting of the Committee, which Mr. Hall has called for the 30th instant.

Mar Lodge, Braemar, Aberdeenshire, N.B.,
August 29, 1889.

No. 101.

Sir F. Plunkett to the Marquis of Salisbury.—(*Received September* 2.)

My Lord, *Stockholm, August* 29, 1889.

I CALLED at the Foreign Department to-day and informed Count Gyldenstolpe, as instructed by your Lordship's despatch of the 26th instant, that the British Delegates, who have authority to act *ad referendum* only, will attend the Maritime Conference at Washington on the date fixed by the United States' Government, and that they will, at the opening of the deliberations, state the reserves which Her Britannic Majesty's Government make respecting the later portions of the programme prepared for the discussion of the Conference.

Count Gyldenstolpe expressed his thanks for this communication, and said he would at once inform Baron Akerhielm of it.

Count Gyldenstolpe repeated what I have already reported in my despatch of the 5th instant, viz., that the Swedish-Norwegian Delegates would act only *ad referendum*, but were authorized to discuss the whole programme as proposed.

No. 102.

Mr. Beauclerk to the Marquis of Salisbury.—(*Received September* 2.)

My Lord, *Berlin, August* 30, 1889.

I HAVE the honour to inclose herewith to your Lordship translation of a note which I have received from the German Government respecting the attendance of their Delegates at the forthcoming Marine Conference at Washington.

I have, &c.

Foreign Office to Board of Trade.

Sir, *Foreign Office, September* 13, 1889.

WITH reference to your letter of the 22nd ultimo respecting the Maritime Conference at Washington, I am directed by the Marquis of Salisbury to transmit to you, to be laid before the Board of Trade, the accompanying drafts of despatches which it is proposed to address to the British Delegates appointed to attend the Conference on behalf of Her Majesty's Government.

The draft of instructions has been prepared in the usual form, as this Office is not aware that Mr. Hall is to receive instructions separate from those addressed to the other British Delegates, although separate letters of appointment will be given. Mr. Hall has suggested that the Delegates and all the members of the Committee appointed to inquire into the matters intended to be raised at the Conference should receive notice and information respecting the question of the load line in readiness for discussion at their meeting on the 30th instant.

Lord Salisbury would be glad to learn, at the Board's earliest convenience, whether these drafts meet with their concurrence, and, if not, in what manner the Board would wish them to be altered.

Your colleagues will be Mr. Charles Hall, Q.C., M.P., who is appointed to be First British Delegate, Admiral Bowden-Smith, Admiral Sir G. Nares, K.C.B., Mr. Thomas Gray, C.B., Captain H. Wyatt, and Captain Kendall.

I inclose, for your information, the correspondence which has passed with reference to this Conference.

The instructions for the guidance of the British Delegates will be contained in a subsequent despatch.

Mr. C. A. Spring-Rice, of this Office, has been selected to act as Secretary to the British Delegates at this Conference, and will receive in this capacity a Commission as Acting Second Secretary to Her Majesty's Legation at Washington.

I am, &c.

(Signed) SALISBURY.

No. 117.

The Marquis of Salisbury to the British Delegates at the Marine Conference.

Gentlemen, *Foreign Office, September* 27, 1889.

THE programme of subjects which the Maritime Conference will be invited to discuss has already been communicated to you in the correspondence inclosed in my previous despatch of this day's date. While Her Majesty's Government do not see any reason at the present moment to object to the subjects contained in the programme, as in themselves unsuitable for international discussion, the scope of the programme appears to them far too extensive to afford any prospect that the Conference can arrive at valuable conclusions on all the subjects proposed within any session of reasonable duration.

It should also be borne in mind that circumstances may arise at any moment during the Conference which may render the discussion of some or other of the subjects unnecessary or highly inconvenient. Her Majesty's Government wish it to be clearly understood that for the present the British Delegates have authority to discuss those matters only which are set down in General Division No. I of the programme, together with the question of the draught to which vessels should be restricted when loaded, which question forms General Division No. III.

Her Majesty's Government also wish it to be clearly understood that, in accordance with the constant practice of Conferences of this nature, the British Delegates will not have power to bind Her Majesty's Government; any proposal which the British Delegates may make, and any action which the Conference may adopt or recommend, will be *ad referendum* only for the consideration and decision of Her Majesty's Government.

I have to instruct you to insert upon the Protocol of the first sitting a statement to this effect.

In technical Conferences considerable latitude is permitted to discussion and to statements made in them; you will bear this in mind, but you will be careful either not to sign any document or recommendation without express authority to do so, or to intimate distinctly that in signing any instrument with your colleagues, the Delegates of the foreign Powers represented, it is not to be assumed that Her Majesty's Government accept any text or document which has not been submitted to them and approved.

You will report home the proceedings of the Conference, and ask for further instructions on such points as you and your colleagues may think necessary.

You will announce your arrival at Washington to Her Majesty's Representative,

* Similar letters, *mutatis mutandis*, to Admiral Bowden-Smith, Admiral Sir G. Nares, Mr. Gray, Captain Wyatt, and Captain Kendall.

who has been requested to take the necessary steps with the view to place you in communication with the proper authorities, and to give you all the assistance and advice which you may require.

I am, &c.
(Signed) SALISBURY.

No. 118.

The Marquis of Salisbury to Mr. Edwardes.

Sir, *Foreign Office, September* 27, 1889.

YOU will have learnt from my telegram of the 23rd ultimo that Her Majesty's Government have finally decided to send Delegates to the Marine Conference at Washington, and I now inclose, for your information, a copy of the instructions which I have addressed to the gentlemen appointed to take part in the Conference on behalf of Her Majesty's Government.*

The British Delegates will be:—

Mr. Charles Hall, Q.C., M.P.; two Representatives selected by the Admiralty, namely, Admiral Sir R. Molyneux, K.C.B., and Admiral Bowden-Smith; and four Representatives selected by the Board of Trade, namely, Admiral Sir George Nares, K.C.B.; Mr. Thomas Gray, Assistant Secretary of the Marine Department of the Board of Trade; Captain H. Wyatt, of the Peninsular and Oriental Service; and Captain Kendall, of the City of Dublin Steam Packet Company, who has a large experience of navigation in narrow and crowded waters. These gentlemen will be accompanied by Mr. C. A. Spring-Rice, of this Office, who will be temporarily attached to the Legation at Washington, and will act as Secretary to them.

I have to request you to announce the above appointments to the Government of the United States.

The British Delegates will announce their arrival to you; and I have to request that you will place them in communication with the proper authorities, and that you will afford them all the assistance and advice they may require.

I am, &c.

Committee on Collisions at Sea to Board of Trade.

Sir, 7, *Whitehall Gardens, London, September* 30, 1889.

WE have to state that, in compliance with the request of Sir M. Hicks-Beach, we have carefully considered the present International Regulations for preventing collisions at sea, with the object of deciding what principles should guide the Delegates who will represent Her Majesty's Government at the Washington Maritime Conference.

We do not think it necessary to alter the Regulations in principle, but we inclose a Paper showing in detail what modifications we think might be made the subject of consideration.

We think the British Delegates should be guided by these suggestions, but they will, of course, at the same time, be prepared to give careful consideration to any proposals that may be brought forward at the Conference. We have the honour to request that you will communicate this letter, together with a copy of the proposed amended Regulations, to the Secretary of the Admiralty.

We desire, in conclusion, to express our strong appreciation of the valuable assistance rendered to the Committee by the Secretary, Mr. W. J. Howell. It is mainly owing to his expedition and energy that we have been enabled to bring our sittings to a close within so limited a time, and we trust that you will be able to mark our sense of his services by a suitable acknowledgment.

No. 125.

British Delegates to Marine Conference to the Marquis of Salisbury.—(*Received October* 28.)

My Lord, *Washington, October* 16, 1889.

AT an informal meeting which we held this afternoon with certain members of the American and other Delegations, it was proposed by Admiral Franklin, President of the Conference, and seconded by Mr. Goodridge, Delegate of the United States, that before proceeding to discuss any one Division the Conference should be asked to vote *seriatim* as to whether it should deal with each of the Divisions included in the general programme drawn up by the United States' Representatives.

Mr. Hall pointed out that this course was undesirable, as the discussion of General Division No. I would probably be of so lengthy and complicated a nature as to make it possible, and even probable, that by the time it was completed the Delegates might consider that it was unnecessary to proceed to the discussion of any other matter included in the programme.

After considerable discussion this view was acceded to by Admiral Franklin and Mr. Goodridge, and they agreed to propose the inclosed Resolutions at the next meeting of the Conference.

We have, &c.

British Delegates to Marine Conference to the Marquis of Salisbury.—(*Received October* 28.)

My Lord, *Washington, October* 17, 1889.

WE have the honour to inform your Lordship that the second meeting of the Marine Conference took place to-day.

Four Secretaries were elected: Mr. Cottman, Secretary to the United States' Delegation; M. Blaers, Secretary to that of Germany; M. Ribière, one of the Delegates of France; and Mr. Spring-Rice.

We then, through Mr. Hall, made a statement, as instructed by your Lordship, to the effect that we have authority to discuss those matters only which are set down in General Divisions Nos. I and III of the programme, and that any proposal we may make, and any action the Conference may adopt or recommend, will be *ad referendum* only.

A copy of the statement is inclosed herewith.

In accordance with the understanding arrived at at the informal meeting held yesterday, referred to in our immediately preceding despatch, Mr. Goodrich, an American Delegate, made the proposals agreed upon, which were carried unanimously.

Pursuant to the terms of the Resolutions above mentioned, the Conference then proceeded to the discussion of General Division No. I. They agreed that the discus-

sion should be based on the International Rules of the Road, and began to consider *seriatim* the Articles in the English text.

Various amendments were proposed, which were ordered to be printed for subsequent consideration.

We have, &c.

Statement by British Delegates.

Mr. President,

BEFORE proceeding to the discussion of the various matters to be dealt with in this Conference, I think it is desirable that I should state briefly the instructions which Her Majesty's Government have given to my colleagues and myself.

I need not say that Her Majesty's Government are most anxious that the deliberations of this Conference should have a permanent result in arriving at conclusions upon these very important matters, in which the interests of all maritime nations are altogether in common, and in the consideration of which their views will probably be harmonious.

Her Majesty's Government recognize that in the institution of this Conference by the United States their object and aim has been to promote the universal interests and welfare of the whole of seafaring humanity.

Under these circumstances Her Majesty's Government have thought it desirable to limit their instructions to my colleagues and myself to the matters set down in General Divisions Nos. I and III. In doing this they wish it to be clearly understood that, whilst they do not see any reason at the present moment to object to the subjects contained in the programme as in themselves unsuitable for international discussion, the scope of the programme appears to them too extensive to afford any prospect that the Conference can arrive at valuable conclusions on all the subjects proposed within any session of reasonable duration.

I may also point out that circumstances may arise during the Conference which may render the discussion of some or other of the subjects unnecessary. And it is for these reasons, and from their anxious desire that a practical result may flow from the proceedings of this Conference, that Her Majesty's Government have thought it desirable to limit their instructions as I have mentioned.

I may add, on behalf of my colleagues and myself, that we shall use our best endeavours to render to the Conference all the assistance that lies in our power, and we beg to offer our hearty congratulations to our foreign colleagues upon our having been able to secure the valuable co-operation of yourself as their President.

In accordance with the understanding arrived at between the United States' Government and that of Her Majesty's Government, the British Delegates will not have power to bind Her Majesty's Government. Any proposal which the British Delegates will make, and any action which the Conference may adopt or recommend, will be *ad referendum* only for the consideration and decision of Her Majesty's Government.

No. 127.

British Delegates to Marine Conference to the Marquis of Salisbury.—(Received October 28.)

My Lord, *Washington, October* 18, 1889.

WE have the honour to inform your Lordship that the third meeting of the Conference took place to-day.

The President announced that the Protocols were not yet prepared.

It was proposed and passed that "a Committee of three should be appointed to prepare material for printing the English version of the International Rules of the Road, with memoranda of the modifications introduced by the law of the United States and of other countries."

The Conference then proceeded with the discussion of the Rules, various amendments in which were proposed and ordered to be printed.

We have, &c.

Inclosure in No. 128.

Protocol of Meeting, Wednesday, October 16, 1889.

Washington, October 16, 1889.

IN response to the invitation extended by the President of the United States to all the Maritime Governments to be represented at an International Marine Conference to secure greater safety for life and property at sea, Delegates from the following countries, Austria-Hungary, Belgium, China, Chile, Denmark, France, Germany, Great Britain, Guatemala, Honduras, Italy, Japan, Mexico, Norway, Russia, Spain, Sweden, Siam, the Netherlands, the United States of America, and Venezuela, assembled at 11 o'clock in the forenoon of the 16th October, 1889, in the Diplomatic Reception Room of the State Department.

After the presentation of the Delegates to the Secretary of State, the latter welcomed them in the following words:—

"Gentlemen,

"It is the cause of extreme gratification to the Government of the United States that its invitation to the Maritime Powers of the world has been met with so general a response. Representatives from Asia, from Europe, from North and South America, and from the isles of the sea, will compose the Conference. On behalf of the United States I welcome you all, gentlemen, to the honourable, the scientific, the philanthropic duties which lie before you. The already and the rapidly increasing intercourse between continent and continent, between nation and nation, demands that every protection against the dangers of the sea and every guard for the safety of human life shall be provided.

"The spoken languages of the world will continue to be many; but necessity commands that the unspoken language of the sea shall be one. That language must be as universal as the needs of man for commerce and intercourse with his fellow-man. The deep interest which the maritime nations have taken in the questions at issue is

shown by the eminent character and the wide experience of the Delegates to whom they have committed the important work. Again, gentlemen, I welcome you, and after your preliminary organization is completed, it will be my pleasure to present you in person to the President of the United States."

The Delegates having then assembled for permanent organization, Mr. Charles Hall, Q.C., M.P., one of the Delegates from Great Britain, being granted the floor, nominated Rear-Admiral S. R. Franklin, one of the Delegates from the United States of America, as permanent President of the Conference; this motion being seconded by several Delegates and voted upon in the affirmative unanimously, Rear-Admiral S. R. Franklin was declared unanimously elected to the chair, in accepting which honour he addressed the Conference in the following words:—

"Before proceeding to the further organization of the Conference, I desire to express to the Delegates my high appreciation of the distinguished honour they have conferred upon me in selecting me to preside over their deliberations.

"The little experience which my profession affords in the Parliamentary duties I am now called upon to perform encourages me to hope for the indulgence of the Conference in any errors of judgment I may commit.

"I feel that it is needless for me to say that in any rulings or decisions which I may be called upon to make I shall endeavour to be governed by a spirit of entire fairness, and I trust that my efforts will meet the approval of the Conference.

"Thanking you, gentlemen, for the honour you have done me, I now declare the Conference ready for its further organization."

Mr. William W. Goodrich, a Delegate from the United States of America, then moved that the Conference adjourn until 11 o'clock in the forenoon of Thursday, the 17th October, 1889, to meet at the Wallach House. This motion being voted upon and carried unanimously, the meeting was declared adjourned.

The Delegates were afterwards formally presented to the President of the United States; the latter, standing in the centre of the semicircle, spoke a few informal words of welcome, expressing his gratification that the Conference had assembled under such pleasant auspices. He expressed his deep personal interest in the result which might be anticipated and, he trusted, attained by the Conference, and hoped that the passage of the seas might be made as safe as it has been made rapid.

The President, in conclusion, said that the object for which the Conference had assembled was one which would attract universal interest, and its attainment would be warmly welcomed by all nations.

Sir J. Pauncefote to the Marquis of Salisbury.—(*Received November* 1.)

(Telegraphic.) *Washington, November* 1, 1889.

FOR the Admiralty, from the Delegates to Marine Conference:—

"What are the latest Regulations with regard to rays from side lights crossing bows of vessels?"

No. 130.

Admiralty to Foreign Office.—(*Received November* 2.)

THE Secretary of the Admiralty presents his compliments to the Under-Secretary of State for Foreign Affairs, and begs to inclose the latest Regulations as to the "rays from side lights," for communication to the Delegates to the Marine Conference at Washington, in reply to the telegram of the 1st November, forwarded in the Under-Secretary's note of yesterday.

Admiralty, November 2, 1889.

No. 131.

The Marquis of Salisbury to British Delegates to Marine Conference.

Gentlemen, *Foreign Office, November* 2, 1889.

I INCLOSE, for your information, a copy received from the Admiralty of the latest Regulations on "rays from side lights," asked for in your telegram of the 1st instant.*

I am, &c.
(Signed) SALISBURY.

No. 132.

Foreign Office to Board of Trade.†

Sir, *Foreign Office, November* 4, 1889.

I AM directed by the Secretary of State for Foreign Affairs to transmit to you, to be laid before the Board of Trade, the accompanying copies of despatches, as marked in the margin,‡ respecting the proceedings of the International Maritime Conference at Washington.

I am, &c.
(Signed) T. V. LISTER.

No. 133.

Foreign Office to Board of Trade.†

Sir, *Foreign Office, November* 8, 1889.

I AM directed by the Secretary of State for Foreign Affairs to transmit to you, to be laid before the Board of Trade, the accompanying further printed correspondence, as marked in the margin,§ respecting the Maritime Conference now sitting at Washington.

I am, &c.
(Signed) T. V. LISTER.

No. 134.

The Marquis of Salisbury to Sir J. Pauncefote.

(Telegraphic.) *Foreign Office, November* 8, 1889, 7·20 P.M.

THE Maritime Conference has made so much progress with the matters referred to it that Her Majesty's Government are of opinion that the British Delegates should remain to discuss the remaining subjects. It is possible that further technical assistance may be necessary for this purpose.

Telegraph the Delegates' wishes in this respect.

Mr. Wimshurst, of the Board of Trade, and Mr. Scott, might attend in regard to the construction of vessels and to meteorology respectively.

---

* No. 130. † Also to Admiralty. ‡ Nos. 124, 125, 126, and 127. § No. 128.

No. 135.

Sir J. Pauncefote to the Marquis of Salisbury.—(*Received November* 10.)

(Telegraphic.) *Washington, November* 9, 1890.

THE British Delegates to the Maritime Conference request me to say, in reply to your Lordship's telegram of 8th, that they will be happy to remain and discuss the rest of the programme. They will be glad if Mr. H. E. Brown and Mr. Scott could be sent out immediately, as Committees were appointed yesterday and a British member will have to be added to each. Messrs. Gray and Kendal will probably return when Ist and IIIrd Divisions are completed. Matters are proceeding most satisfactorily.

No. 136.

The Marquis of Salisbury to Sir J. Pauncefote.

(Telegraphic.) *Foreign Office, November* 15, 1889.

IN reply to your telegram of the 9th respecting the Maritime Conference, the Board of Trade request that the British Delegates be informed that they do not think it necessary to nominate Mr. Scott a separate Delegate to discuss meteorological matters. If, however, it should be considered absolutely necessary, they will be ready, on receiving a representation to that effect, to reconsider the question.

Mr. James Wimshurst, the Principal Shipwright Surveyor for Iron Vessels, will go out to-morrow by the "Servia," to assist in the discussion of General Division II in place of Mr. Brown.

Despatch follows by post.

No. 137.

The British Delegates to International Marine Conference to the Marquis of Salisbury.—(*Received November* 22.)

My Lord, *Washington, November* 9, 1889.

WE have the honour to inform your Lordship that Sir Julian Pauncefote has communicated to us your telegram of yesterday's date, stating that Her Majesty's Government consider that their Representatives should remain to discuss the rest of the programme, and instructing him to telegraph our views and wishes.

We informed him, in reply, that we should be happy to remain and discuss the rest of the programme as originally proposed by the United States' Government; and in regard to the offer of Her Majesty's Government to supply any technical assistance that might be required, we requested that Mr. Scott and Mr. H. E. Browne might be immediately dispatched to Washington in order that they might serve on Committees.

We urged at the same time that there might be no delay in dispatching these gentlemen, as four Committees were appointed yesterday to consider the subjects contained in General Divisions II, IV, VI, VII, VIII, IX, X, XI, XII, and XIII.

We added that the discussion of the Rules of the Road was progressing in a satisfactory manner.

We have, &c.

No. 138.

The British Delegates to International Marine Conference to the Marquis of Salisbury.—
(Received November 22.)

My Lord, *Washington, November 11, 1889.*

IN compliance with the instructions contained in your Lordship's telegram to Sir J. Pauncefote of the 8th instant, we have the honour to inform your Lordship that, on the meeting of the Conference to-day, we made, through Mr. Hall, the statement, copy of which is inclosed herewith, to the effect that Her Majesty's Government has instructed us to discuss the rest of the programme, and that, acting upon these instructions, we have telegraphed home for all papers and technical assistance necessary.

On the proposal of the United States' Delegates, it was decided that two additional members should be appointed on each of the Committees dealing with General Divisions II, IV, V, VI, VII, VIII, IX, X, XI, XII, and XIII.

We have, &c.

(Signed) CHARLES HALL.
R. H. MORE MOLYNEUX.
THOMAS GRAY.
G. S. NARES.
H. WYATT.

Inclosure in No. 138.

Statement made by Mr. Hall in Conference.

Mr. President,

BEFORE proceeding to discuss the business of to-day, I should like to be permitted to make a statement with regard to the programme which is now before the Conference in its entirety. The Delegates will remember that at the opening of our proceedings I stated that Her Majesty's Government had instructed us to confine ourselves to the discussion of Divisions I and II, as the scope of the programme appeared to them too extensive to afford the prospect that the Conference could arrive at valuable conclusions on all the subjects proposed within any Session of reasonable duration.

I also pointed out that these instructions were prompted by an anxious desire on the part of Her Majesty's Government that there should be a practical outcome of the proceedings of the Conference.

Since that time, however, the Conference, owing in a great measure to the assistance it has received from the various Committees which have dealt with matters included in Division I, has made more rapid progress than we had anticipated; and we are able now to form some approximate forecast of the time necessary for the completion of that Division and of Division III.

Under these circumstances, I have much pleasure in stating that Her Majesty's Government have instructed us to discuss the rest of the programme, and that, acting upon those instructions, we have at once telegraphed home for all papers and technical assistance necessary. We hope to have the assistance of experts in meteorology and construction of vessels, so as to be able personally to lay before the Conference the information and knowledge in our possession; and I have the authority of my colleagues to say that they will be most happy if they can contribute anything which will be of use and assistance to the Conference in the consideration of these questions, which are of so much importance to the whole of the maritime world.

No. 139.

The British Delegates to International Marine Conference to the Marquis of Salisbury.—
(Received January 13, 1890.)

My Lord, *Washington, December 31, 1889.*

WE have the honour to inform your Lordship that the Conference terminated its labours to-day.

We beg to inclose herewith the following documents:—

1. The Protocols of the Conference containing a *verbatim* report of the proceedings.
2. A Summary of the above which we have prepared for convenience of reference.
3. The Report of a Committee appointed to prepare the material for printing the International Rules of the Road, so as to show the divergence between the Rules as enacted in the Laws of the different Powers.
4. The Report of the Committee on Lights, and further Report of the same.
5. The Report of the Committee on Sound Signals.
6. The second Report of the above Committee as to the adoption of certain new fog-signals.
7. The Report of the Committee on Systems and Devices.
8. The Report of the Committee appointed to consider the lights to be carried or shown on small vessels, pilot-vessels, and fishing-vessels.

These Reports were all considered in relation to the discussion of the International Rules of the Road.

9. The final Report of the Committee on the Collocation of the Rules containing (*a*) the Regulations for preventing collisions at sea as finally agreed on by the Conference, and (*b*) Resolutions approved of by the Conference, and recommended to the attention of the Powers represented thereat.
10. The Report of the Committee on Life Saving Systems and Devices, appointed to consider the subjects mentioned in General Division V of the Programme.
11. The Report of the Committee on the subject of a uniform load mark, General Division III.
12. The Reports of the Committee on the subjects contained in General Division 2 (Regulations to determine the seaworthiness of vessels), General Division IV (regarding the designation and marking of vessels), and General Division VI (necessary qualifications for officers and seamen, including tests for sight and colour-blindness).
13. The Report of the Committee appointed to consider General Division VII (lanes for steamers on frequented routes), and General Division VIII (night signals for communicating information at sea).
14. The Report of the Committee appointed to consider General Division IX (warnings of approaching storms), Division X (reporting, marking, and removing dangerous wrecks or obstructions to navigation), General Division XI (notice of dangers to navigation), and General Division XII (a uniform system of buoys and beacons).
15. The Report of the Committee on General Division XIII, on the establishment of a Permanent Maritime Commission.

The above Reports (Inclosures 10 to 15 inclusive) have been considered by the Conference and adopted.

We wish, in conclusion, to bring to your Lordship's notice the valuable services which have been rendered to us by Mr. C. A. Spring-Rice, who was attached to the Delegation as Secretary. He has been most active and zealous throughout the protracted sittings of the Conference, and we have much pleasure in acknowledging the great assistance we have received from him upon all points.

We have, &c.
(Signed) CHARLES HALL.

Inclosure 1 in No. 139.

Protocols of the International Marine Conference, held at Washington, October to December 1889.

[Printed separately.]

Inclosure 2 in No. 139.

Summary of Proceedings.

October 17, 1889.

IT was resolved that the Articles of the Revised Regulations for Preventing Collisions at Sea, and known as the International Rules, be considered Article by Article in numerical order.

The Rules were accordingly read, and various amendments were proposed which were printed for consideration.

The Rules are appended.

REGULATIONS FOR PREVENTING COLLISIONS AT SEA.

Article 1. In the following Rules every steam-ship which is under sail and not under steam is to be considered a sailing-ship; and every steam-ship which is under steam, whether under sail or not, is to be considered a ship under steam.

Rules concerning Lights.

Art. 2. The lights mentioned in the following Articles, numbered 3, 4, 5, 6, 7, 8, 9, 10, and 11, and no others, shall be carried in all weathers, from sunset to sunrise.

Art. 3. A sea-going steam-ship when under way shall carry—

(*a.*) On or in front of the foremast, at a height above the hull of not less than 20 feet, and if the breadth of the ship exceeds 20 feet, then at a height above the hull not less than such breadth, a bright white light, so constructed as to show an uniform and unbroken light over an arc of the horizon of 20 points of the compass, so fixed as to throw the light 10 points on each side of the ship, viz., from right ahead to two points abaft the beam on either side, and of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 5 miles.

(*b.*) On the starboard side, a green light, so constructed as to show an uniform and unbroken light over an arc of the horizon of 10 points of the compass, so fixed as to throw the light from right ahead to 2 points abaft the beam on the starboard side, and of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 2 miles.

(*c.*) On the port side, a red light, so constructed as to show an uniform and unbroken light over an arc of the horizon of 10 points of the compass, so fixed as to throw the light from right ahead to 2 points abaft the beam on the port side, and of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 2 miles.

(*d.*) The said green and red side lights shall be fitted with inboard screens projecting at least 3 feet forward from the light, so as to prevent these lights from being seen across the bow.

Art. 4. A steam-ship, when towing another ship, shall, in addition to her side lights, carry two bright white lights in a vertical line one over the other, not less than 3 feet apart, so as to distinguish her from other steam-ships. Each of these lights shall be of the same construction and character, and shall be carried in the same position, as the white light which other steam-ships are required to carry.

Art. 5. (*a.*) A ship, whether a steam-ship or a sailing-ship, which from any accident is not under command, shall at night carry, in the same position as the white light which steam-ships are required to carry, and, if a steam-ship, in place of that light, three red lights in globular lanterns, each not less than 10 inches in diameter, in a vertical line one over the other, not less than 3 feet apart, and of such a character as to be visible on a dark night with a clear atmosphere at a distance of at least 2 miles; and shall by day carry in a vertical line one over the other, not less than 3 feet apart, in front of but not lower than her foremast head, three black balls or shapes, each 2 feet in diameter.

(*b.*) A ship, whether a steam-ship or a sailing-ship, employed in laying or in picking up a telegraph cable, shall at night carry in the same position as the white light which steam-ships are required to carry, and, if a steam-ship, in place of that light, three lights in globular lanterns each not less than 10 inches in diameter, in a vertical line over one another, not less than 6 feet apart; the highest and lowest of these lights shall be red, and

the middle light shall be white, and they shall be of such a character that the red lights shall be visible at the same distance as the white light. By day she shall carry in a vertical line one over the other not less than 6 feet apart, in front of but not lower than her foremast head, three shapes not less than 2 feet in diameter, of which the top and bottom shall be globular in shape and red in colour, and the middle one diamond in shape and white.

(*c.*) The ships referred to in this Article, when not making any way through the water, shall not carry the side lights, but when making way shall carry them.

(*d.*) The lights and shapes required to be shown by this Article are to be taken by other ships as signals that the ship showing them is not under command, and cannot therefore get out of the way. The signals to be made by ships in distress and requiring assistance are contained in Article 27.

Art. 6. A sailing-ship under way, or being towed, shall carry the same lights as are provided by Article 3 for a steam-ship under way, with the exception of the white light, which she shall never carry.

Art. 7. Whenever, as in the case of small vessels during bad weather, the green and red side lights cannot be fixed, these lights shall be kept on deck, on their respective sides of the vessel, ready for use; and shall, on the approach of or to other vessels, be exhibited on their respective sides in sufficient time to prevent collision, in such manner as to make them most visible, and so that the green light shall not be seen on the port side nor the red light on the starboard side.

To make the use of these portable lights more certain and easy, the lanterns containing them shall each be painted outside with the colour of the light they respectively contain, and shall be provided with proper screens.

Art. 8. A ship, whether a steam-ship or a sailing-ship, when at anchor, shall carry, where it can best be seen, but at a height not exceeding 20 feet above the hull, a white light, in a globular lantern of not less than 8 inches in diameter, and so constructed as to show a clear uniform and unbroken light visible all round the horizon, at a distance of at least 1 mile.

Art. 9. A pilot-vessel, when engaged on her station on pilotage duty, shall not carry the lights required for other vessels, but shall carry a white light at the masthead, visible all round the horizon, and shall also exhibit a flare-up light or flare-up lights at short intervals, which shall never exceed fifteen minutes.

A pilot-vessel, when not engaged on her station on pilotage duty, shall carry lights similar to those of other ships.

Art. 10. Open boats and fishing-vessels of less than 20 tons net registered tonnage, when under way and when not having their nets, trawls, dredges, or lines in the water, shall not be obliged to carry the coloured side lights; but every such boat and vessel shall in lieu thereof have ready at hand a lantern with a green glass on the one side and a red glass on the other side, and on approaching to or being approached by another vessel such lantern shall be exhibited in sufficient time to prevent collision, so that the green light shall not be seen on the port side nor the red light on the starboard side.

The following portion of this Article applies only to fishing-vessels and boats when in the sea off the coast of Europe lying north of Cape Finisterre:—

(*a.*) All fishing-vessels and fishing-boats of 20 tons net registered tonnage, or upwards, when under way and when not required by the following Regulations in this Article to carry and show the lights therein named, shall carry and show the same lights as other vessels under way.

(*b.*) All vessels when engaged in fishing with drift-nets shall exhibit two white lights from any part of the vessel where they can be best seen. Such lights shall be placed so that the vertical distance between them shall be not less than 6 feet and not more than 10 feet; and so that the horizontal distance between them measured in a line with the keel of the vessel shall be not less than 5 feet and not more than 10 feet. The lower of these two lights shall be the more forward, and both of them shall be of such a character, and contained in lanterns of such construction, as to show all round the horizon, on a dark night with a clear atmosphere, for a distance of not less than 3 miles.

(*c.*) A vessel employed in line-fishing with her lines out shall carry the same lights as a vessel when engaged in fishing with drift-nets.

(*d.*) If a vessel when fishing becomes stationary in consequence of her gear getting fast to a rock or other obstruction, she shall show the light and make the fog-signal for a vessel at anchor.

(*e.*) Fishing-vessels and open boats may at any time use a flare-up in addition to the lights which they are by this Article required to carry and show. All flare-up lights exhibited by a vessel when trawling, dredging, or fishing with any kind of drag-net shall

be shown at the after part of the vessel, excepting that, if the vessel is hanging by the stern to her trawl, dredge, or drag-net, they shall be exhibited from the bow.

(*f.*) Every fishing-vessel and every open boat when at anchor between sunset and sunrise shall exhibit a white light visible all round the horizon at a distance of at least 1 mile.

(*g.*) In fog, mist, or falling snow, a drift-net vessel attached to her nets, and a vessel when trawling, dredging, or fishing with any kind of drag-net, and a vessel employed in line-fishing with their lines out, shall at intervals of not more than two minutes make a blast with her fog-horn and ring her bell alternately.

Art. 11. A ship which is being overtaken by another shall show from her stern to uch last-mentioned ship a white light or a flare-up light.

Sound Signals for Fog, &c.

Art. 12. A steam-ship shall be provided with a steam-whistle or other efficient steam-sound signal, so placed that the sound may not be intercepted by any obstructions, and with an efficient fog-horn to be sounded by a bellows or other mechanical means, and also with an efficient bell.* A sailing-ship shall be provided with a similar fog-horn and bell.

In fog, mist, or falling snow, whether by day or night, the signals described in this Article shall be used as follows; that is to say:—

(*a.*) A steam-ship under way shall make with her steam-whistle, or other steam-sound signal, at intervals of not more than two minutes, a prolonged blast.

(*b.*) A sailing-ship under way shall make with her fog-horn, at intervals of not more than two minutes, when on the starboard tack one blast, when on the port tack two blasts in succession, and when with the wind abaft the beam three blasts in succession.

(*c.*) A steam-ship and a sailing-ship, when not under way, shall at intervals of not more than two minutes ring the bell.

Speed of Ships to be moderate in Fog, &c.

Art. 13. Every ship, whether a sailing-ship or a steam-ship, shall, in a fog, mist, or falling snow, go at a moderate speed.

Steering and Sailing Rules.

Art. 14. When two sailing-ships are approaching one another, so as to involve risk of collision, one of them shall keep out of the way of the other, as follows, viz.:—

(*a.*) A ship which is running free shall keep out of the way of a ship which is close-hauled.

(*b.*) A ship which is close-hauled on the port tack shall keep out of the way of a ship which is close-hauled on the starboard tack.

(*c.*) When both are running free with the wind on different sides, the ship which has the wind on the port side shall keep out of the way of the other.

(*d.*) When both are running free with the wind on the same side, the ship which is to windward shall keep out of the way of the ship which is to leeward.

(*e.*) A ship which has the wind aft shall keep out of the way of the other ship.

Art. 15. If two ships under steam are meeting end on, or nearly end on, so as to involve risk of collision, each shall alter her course to starboard, so that each may pass on the port side of the other.

This Article only applies to cases where ships are meeting end on, or nearly end on, in in such a manner as to involve risk of collision, and does not apply to two ships which must, if both keep on their respective courses, pass clear of each other.

The only cases to which it does apply are, when each of the two ships is end on, or nearly end on, to the other; in other words, to cases in which, by day, each ship sees the masts of the other in a line, or nearly in a line, with her own; and by night, to cases in which each ship is in such a position as to see both the side lights of the other.

It does not apply, by day, to cases in which a ship sees another ahead, crossing her own course; or by night, to cases where the red light of one ship is opposed to the red light of the other, or where the green light of one ship is opposed to the green light of the other, or where a red light without a green light, or a green light without a red light, is seen ahead, or where both green and red lights are seen anywhere but ahead.

* In all cases where the Regulations require a bell to be used a drum will be substituted on board Turkish vessels.

Art. 16. If two ships under steam are crossing, so as to involve risk of collision, the ship which has the other on her own starboard side shall keep out of the way of the other.

Art. 17. If two ships, one of which is a sailing-ship, and the other a steam-ship, are proceeding in such directions as to involve risk of collision, the steam-ship shall keep out of the way of the sailing-ship.

Art. 18. Every steam-ship when approaching another ship so as to involve risk of collision shall slacken her speed, or stop and reverse, if necessary.

Art. 19. In taking any course authorized or required by these Regulations, a steam-ship under way may indicate that course to any other ship which she has in sight by the following signals on her steam-whistle, viz. :—

One short blast to mean "I am directing my course to starboard."

Two short blasts to mean "I am directing my course to port."

Three short blasts to mean "I am going full speed astern."

The use of these signals is optional, but if they are used the course of the ship must be in accordance with the signal made.

Art. 20. Notwithstanding anything contained in any preceding Article, every ship, whether a sailing-ship or a steam-ship, overtaking any other, shall keep out of the way of the overtaken ship.

Art. 21. In narrow channels every steam-ship shall, when it is safe and practicable, keep to that side of the fairway or mid-channel which lies on the starboard side of such ship.

Art. 22. Where by the above Rules one of two ships is to keep out of the way, the other shall keep her course.

Art. 23. In obeying and construing these Rules, due regard shall be had to all dangers of navigation, and to any special circumstances which may render a departure from the above Rules necessary in order to avoid immediate danger.

No Ship, under any circumstances, to neglect proper Precautions.

Art. 24. Nothing in these Rules shall exonerate any ship, or the owner, or master, or crew thereof, from the consequences of any neglect to carry lights or signals, or of any neglect to keep a proper look-out, or of the neglect of any precaution which may be required by the ordinary practice of seamen, or by the special circumstances of the case.

Reservation of Rules for Harbours and Inland Navigation.

Art. 25. Nothing in these Rules shall interfere with the operation of a special Rule, duly made by local authority, relative to the navigation of any harbour, river, or inland navigation.

Special Lights for Squadrons and Convoys.

Art. 26. Nothing in these Rules shall interfere with the operation of any special Rules made by the Government of any nation with respect to additional station and signal lights for two or more ships of war or for ships sailing under convoy.

Art. 27. When a ship is in distress and requires assistance from other ships or from the shore, the following shall be the signals to be used or displayed by her, either together or separately; that is to say—

In the daytime—

1. A gun fired at intervals of about a minute;
2. The International Code signal of distress indicated by N C;
3. The distant signal, consisting of a square flag, having either above or below it a ball or anything resembling a ball.

At night—

1. A gun fired at intervals of about a minute;
2. Flames on the ship (as from a burning tar barrel, oil barrel, &c.);
3. Rockets or shells, throwing stars of any colour or description, fired one at a time, at short intervals.

October 21 *and* 22.

Further amendments were proposed and printed for consideration.

October 28.

Article 1.—*Mr. Goodrich* (United States) proposed to substitute the word "vessel" for "ship"; the word "vessel" being a generic term.

Mr. Hall (Great Britain) proposed that a steam-vessel being towed should be treated as a sailing-vessel.

The first amendment was adopted, the second postponed.

Mr. Hall (Great Britain) proposed to add to Article 1 the words, "Steam-vessels shall include all vessels propelled by machinery," so as to include modern vessels propelled by a motive power other than steam.

A discussion arose on the wording, and it was decided to put the amendment in principle, leaving the actual wording to a later stage. In this form it was carried.

Article 2.—*Captain Mensing* (Germany) proposed that Article 2 be amended by the addition of the words, "and no others which might be mistaken for such lights," in order to avoid the danger of misleading lights, while recognizing the faat that other lights may be carried on board ship.

This amendment was accepted by the British Delegates, who preferred it to a somewhat similar amendment proposed by Captain Salvesen (Norway) as involving less change in the wording, and carried unanimously.

Mr. Hall (Great Britain) proposed an addition to the Rule to the effect that in cases where the breadth of the ship is over 40 feet the light need not be carried at a greater height above the water than 40 feet.

Some discussion arose owing to a Delegate of the United States stating that the Rule would change the system existing in the harbour and waters of New York. It was, however, pointed out that he was under a misapprehension, and the amendment was carried as proposed.

Article 3.—*Mr. Goodrich* (United States) proposed that the first line be amended as follows, "Every steam-vessel when under way," omitting the word "sea-going" in order that the Rules might be made to apply to all waters alike, the several nations to make their own exceptions as to their own waters.

Mr. Hall (Great Britain) said that, so far as he was aware, the word had no reference to jurisdiction, but that its object was to classify vessels in a general way, sea-going vessels being presumably large enough to carry the lights provided for vessels which navigated the sea.

A clause would have to be inserted excluding vessels too small to carry such lights.

It was pointed out that the word was omitted in the Rules of Austria, Denmark, Germany, Italy, Mexico, Norway, and Sweden.

Dr. Sieveking (Germany) said that the word was omitted in the German Rules because there were no local Rules on the German rivers.

The motion was carried.

November 1.

Extra amendments were proposed.

November 4.

Article 3.—*Captain Mensing* (Germany) proposed: "That a certain candle power be substituted as the standard for the visibility of lights mentioned in these Rules in lieu of the standard now in force."

After discussion, the following amendment was proposed: "That a certain candle power be adopted as a standard for the visibility of light mentioned in these Rules, the candle power to be hereafter determined."

It was agreed that this should be recorded in the shape of a note to the Rules, and it was accepted upon these terms by the *Delegates of Great Britain*, and carried by the Conference.

Mr. Verney (Siam) proposed that the word "uniform" before "unbroken light" be struck out, on the ground that the light could not be made uniform.

The amendment was accepted by *Mr. Hall* (Great Britain), and carried.

Article 4.—Amendment proposed by *Mr. Hall* (Great Britain), that the distance between the lights be 6 feet instead of 3 feet.

The United States' Delegates proposed that the distance be 4 feet.

The former amendment was carried.

Captain Shackford (United States) proposed an amendment to the effect that a vessel towing shall carry a small bright light abaft the funnel for the vessel being towed to steer by.

Mr. Hall suggested that the Rule should be made permissive.

It was put in the following form :—

"A small bright light abaft the funnel or after mast may be carried for the vessel being towed to steer by, such light to be only visible from right astern to four points on each quarter."

It was opposed by *Captain Richard* (France), and put to the vote.

The Delegates of France, Norway, Sweden, and *the Netherlands* voted against it; and it was carried by 15 to 4.

November 5.

Mr. Shackford proposed a change in his amendment as to lights on vessels towing, viz., "not to be visible before the beam," instead of "to be visible from right astern to four points abaft the beam."

Mr. Hall (Great Britain) supported the change on the ground of simplicity; and it was carried.

Captain Malmberg (Sweden) proposed that a sailing-vessel towing another vessel should carry the same lights as a vessel not under command.

After some discussion, during which *Mr. Hall* (Great Britain) stated that he had no objection to giving such a ship a distinctive light, provided such a light could be found, the amendment was carried in a modified form as follows :—

"A sailing-vessel towing a disabled vessel shall carry some distinctive light, provided such light can be determined upon by the Conference."

Mr. Hall (Great Britain) proposed an amendment to Article 5 to add the words, "These signals are not signals of ships in distress and requiring assistance. Such signals are contained in Article 27;" a change of verbiage in order to make the Article plainer.

The amendment was carried.

Article 5.—*M. van Steyn* (Netherlands) proposed an amendment :—

"A ship, whether a steam-ship or a sailing-ship, which from any accident is not under command, shall at night carry in the same position as the white lights which steam-ships are required to carry, and if a steam-ship, in place of that light, three red lights in globular lanterns not less than 6 feet apart, and of such a character as to be visible on a dark night, in a clear atmosphere, at a distance of at least 2 miles, and shall by day," &c.

Mr. Hall (Great Britain) stated that he intended to propose two lights and two balls instead of three, but that it would not affect the principle of the amendment.

The amendment was carried.

M. van Steyn (Netherlands) proposed an amendment :—

"(*b.*) A ship, whether a steam-ship or a sailing-ship, employed in laying or in picking up a telegraph cable, shall at night carry, in the same position as the white light which steam-ships are required to carry, and if a steam-ship, in place of that light, three lights in globular lanterns in a vertical line over one another, not less than 6 feet apart. The highest and lowest of these lights shall be red, and the middle light shall be white, and they shall be of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 2 miles. By day she shall carry, in a vertical line, one over the other, not less than 6 feet apart, where they can best be seen, three shapes not less than 2 feet in diameter, of which the top and bottom shall be globular in shape and red in colour, and the middle one diamond in shape and white."

Captain Mensing (Germany) proposed an amendment to strike out the words "in globular lanterns," and add, after the words, "at a distance of at least 2 miles," the following: "but if she be a steam-ship, then at a distance of not less than 5 miles.

Captain Mensing's amendment was lost.

Mr. Hall (Great Britain) pointed out the difficulty of getting a coloured light to show more than 2 miles, and *Captain Malmberg* (Sweden) stated that ordinary ships were used in Sweden to lay telegraph cables, which could not carry very powerful lights.

The original amendment was carried.

Captain van Steyn (Netherlands) proposed to add, as a recommendation to the Conference, that a special signal should be found for steamers in the daytime which were proceeding under sail only, but which were manageable.

Mr. Hall (Great Britain) said that he had no objection in principle to the proposal, the object of which was to show at once that a vessel which was apparently a steamer was not one, but a sailing-vessel.

The principle was adopted, and referred to the Collocation Committee.

Mr. Hall (Great Britain) proposed:—

"Art. 5. (*a.*) A ship, whether a steam-ship or a sailing-ship, which from any accident is not under command, shall at night carry, in the same position as the white light which steam-ships are required to carry, and if a steam-ship, in place of that light, two red lights in globular lanterns, each not less than 10 inches in diameter, in a vertical line, one over the other, not less than 6 feet apart, and of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 2 miles, and shall by day carry, in a vertical line, one over the other, not less than 6 feet apart, in front of but not lower than her foremast-head, two black balls or shapes, each 2 feet in diameter;" on the ground that two red lights were sufficient.

The amendment was carried.

Dr. Sieveking (Germany) proposed that a vessel aground in a fairway should carry the lights for vessels not under command.

Mr. Hall (Great Britain) stated that it had been argued in the English Courts that vessels aground in a fairway should carry such lights, and not those for a vessel at anchor.

Mr. Goodrich (United States) and *Captain Richard* (France) opposed the amendment, which was negatived by 15 to 5, Great Britain, Germany, Denmark, Russia, Sweden, and Siam voting for it.

[*Note.*—This was subsequently carried. See November 11, *infra.*]

November 7.

Article 6.—*Mr. Hall* (Great Britain) proposed an amendment:—

"Art. 6. A sailing-ship under way or being towed shall carry the same lights as are provided by Article 3 for a steam-ship under way, with the exception of the white light, which she shall never carry;" which was carried.

M. Richard (France) proposed an amendment to the effect that sailing-vessels should carry the same lights as steam-vessels, with a white mast-head light in addition.

He explained, however, that out of deference to his colleagues on the Committee of Lights, who had decided against his proposal, he would now withdraw it.

Mr. Hall (Great Britain) proposed:—

"Art. 8. A ship under 100 feet in length, whether a steam-ship or a sailing-ship, when at anchor, shall carry forward, where it can best be seen, but at a height not exceeding 20 feet above the hull, a white light, in a globular lantern of not less than 8 inches in diameter, and so constructed as to show a clear, uniform, and unbroken light visible all round the horizon, at a distance of at least 1 mile.

"All ships of 100 feet or upwards in length, when at anchor, shall carry two such lights as follows, that is to say:—

"In the forward part of the ship, and at a height of not less than 20 and not exceeding 40 feet above the hull, one such light; and at or near the stern of the ship, and at such a height that it shall be not less than 15 feet lower than the forward light, the other of such lights.

"The length of a ship shall be deemed to be the length appearing in her certificate of registry."

Mr. Hall explained that in his amendment he had inserted the word "forward" after "carry" in the second line, in adoption of an amendment of the German Delegates.

Dr. Sieveking (Germany) proposed to put the limit at 150 feet instead of 100 feet, which he thought was too low.

Mr. Hall accepted the alteration.

Captain Shackford (United States) proposed as an amendment that a distinctive second riding light, consisting of a red and a white light 30 inches apart, should be carried at the stern. This Resolution was put to the Conference and lost; and the original amendment as proposed by Mr. Hall was carried, with the change of 100 to 150 feet.

Article 11.—An amendment to Article 11 was moved by the Delegates from the Netherlands to the effect that every vessel exceeding 20 tons registered should carry on her stern an irregularly occulting white light.

Mr. Hall (Great Britain) moved that before this amendment was put to the vote the proposal made by the British Delegates should be considered, viz.:—

"Art. 11. A ship which is being overtaken by another shall show from her stern to such last-mentioned ship a white light or a flare-up light.

"The white light required to be shown by this Article may be fixed, and carried in a lantern, but in such case the lantern shall be so constructed, fitted, and screened that it

shall throw an uniform and unbroken light over an arc of 12 points, that is to say, for 6 points from right aft on each side of the ship.

"Such lights shall be carried as nearly as practicable on the same level as the side lights."

Mr. Goodrich (United States) proposed that the words "or occulting" should be added after the word "fixed."

Mr. Hall pointed out that the Conference was thus asked to sanction the use of a light as to which they had no data and no precise information, and upon which no public experiments had been made.

Mr. Goodrich's amendment was put and lost; and the British proposal was adopted with two alterations, viz.: (1) the words "uniform and" were struck out in conformity with a previous vote of the Conference. (See *supra*, November 4.)

2. The words, "and so as to be visible on a dark night, in a clear atmosphere, at a distance of 1 mile," were added after the word "ship." Both alterations were accepted by the British Delegates; the limit of 1 mile being adopted with a view to induce small vessels to adopt the light.

The British Delegates then moved an Additional Article, as follows:—

"*Lights and Signals to Attract Attention.*

"Art. .—Every ship may at any time, in addition to the lights which she is by these Regulations required to carry, show a flare-up light or use a detonating signal to attract attention."

Some discussion arose upon this. It was pointed out that confusion with distress signals might be entailed; and *Mr. Hall*, acknowledging that the criticisms were worthy of consideration, asked that the Conference should vote on the principle, leaving it to subsequent discussion as to what kind of signals should be used.

At the suggestion of *M. Flood* (Norway), the words "when necessary" were substituted for "at any time."

The question upon the principle was carried.

[*Note.*—The signals suggested above were adopted, see December 5, *infra*.]

November 8.

Article 12.—*Mr. Hall* (Great Britain) proposed:—

"In fog, mist, or falling snow, whether by day or night, the signals described in this Article shall be used as follows, that is to say:—

"(*a*.) A steam-ship under way shall make with her steam whistle, or other steam sound-signal, at intervals of not more than two minutes, a long blast of about four seconds duration.

"(*b*.) A steam-ship not at anchor, but stopped and having no way upon her, shall sound, at intervals of not more than two minutes, two * long blasts with an interval of about one second between them.

"(*c*.) A sailing-ship under way shall make with her fog-horn, at intervals of not more than ~~two minutes,~~† when on the starboard tack one blast, when on the port tack two blasts in succession, and when with the wind abaft the beam three blasts in succession.

"(*d*.) A steam-ship and a sailing-ship, when at anchor, ~~or moored,~~‡ shall, at intervals of not more than ~~two minutes,~~† ring the bell.§"

On the amendment to section (*a*) a discussion arose.

Captain Shackford (United States) said that the experience of seamen was in favour of a blast of at least six seconds duration, an assertion which was controverted by *Captain Mensing* (Germany).

Captain Wyatt (Great Britain) stated that he had several times had his hearing seriously affected by the continuous sound of the whistle.

The amendment to section (*a*) was carried.

Mr. Hall (Great Britain) then moved his amendment to section (*b*), inserting the word "such" between "two" and "blasts." It was carried.

In subsection (*c*) *Mr. Goodrich* (United States) moved an amendment changing the words "two minutes" to "one minute," which was carried.

In subsection (*d*) the words "or moored" were omitted by general consent, as, by a ruling of the Conference on the 7th November, there was no doubt about the meaning of the words "at anchor."

* "Such" inserted here. † One minute. ‡ Omitted.
§ Added; "rapidly for about five seconds."

On the proposal of *Mr. Goodrich* (United States), to which the British Delegates assented, the latter part of the paragraph was amended to read, "shall at intervals of not more than one minute ring the bell rapidly for about five seconds."

Captain Mensing (Germany) proposed that the words, "to be sounded by a bellows or other mechanical means," in the first paragraph, should be omitted. This was opposed by *Mr. Hall* (Great Britain), and the amendment was lost.

Captain Malmberg (Sweden) moved that a vessel towing should sound a distinctive signal.

At *Mr. Hall's* suggestion, the amendment was carried in principle, and referred to the Committee on Sound Signals, who should also report whether or no it was desirable to have a distinctive signal for a sailing-ship towing.

A discussion arose as to the meaning of the words "at anchor," which *Mr. Goodrich* (United States) desired should be defined by the Collocation Committee, but his proposal was lost.

M. Verbrugghe (Belgium) raised the question as to a standard for fog-signals.

At the instance of *Mr. Hall* (Great Britain), it was moved that it was desirable that there should be a common standard as to the minimum distance at which such signals should be heard in ordinary weather, in order to call the attention of the Powers to the subject, and invite experiments.

The motion was carried.

November 11.

Article 6.—*Mr. Hall* (Great Britain) proposed an amendment to Article 1, to the effect that steamers being towed were to be considered sailing-vessels, but he withdrew it in favour of an amendment to Article 6 moved by *Mr. Goodrich* (United States), which was passed.

Article 6, as amended, is as follows:—

"A sailing-ship under way and any vessel being towed shall carry the same lights as are provided by Article 3 for a steam-ship under way, with the exception of the white light mentioned in Article 3 (*a*), which she shall never carry."

Article 5.—A discussion then took place on a motion from *Mr. Goodrich* (United States) in favour of a system of auxiliary side lights, which was unanimously rejected, the *United States' Delegates* voting against his proposal; and on the proposal of *Captain Shackford* (United States) for a white range light to be carried by steamers on the after mast, visible all round the horizon.

It was supported by *Mr. Hall* (Great Britain), in a permissive form, as an experiment which it was advisable to make, and which he understood had been successfully made in the inland waters of the United States; and was carried in the following form:—

"Art. 3 (*e*). All steamers when under way at night may carry on one of the after masts a white light visible all around the horizon; said light must be at a height of not less than 20 feet above the forward bright light."

Article 12.—*Captain van Steyn* (Netherlands) proposed an amendment to Article 12:—

"A steam-ship shall be provided with a whistle or siren sounded by steam, or other efficient substitute for steam," &c.; to provide for the cases of vessels propelled by electricity.

This amendment was carried.

Mr. Hall (Great Britain) suggested that provision should be made for the use of the gong in Chinese waters, which suggestion was adopted.

Article 8 (*b*).—*Captan Salvesen* (Norway) proposed an amendment as to the lights to be carried by vessels aground in a fairway, which was supported by *Mr. Hall* on the ground that a ship in such a position ought to have a distinctive light.

It was carried in the following form:—

"Art. 8. (*b*). A vessel aground in or near a fairway shall carry, where they can best be seen, two red lights in globular lanterns, one over the other, not less than 6 feet apart, in addition to the above-mentioned anchor light or lights."

Captain Shackford (United States) proposed that Atlantic steamers should use distinctive sound signals to indicate their courses east or west—which proposal he withdrew after some discussion.

Admiral Kaznakoff (Russia) offered some amendments on behalf of the Committee on Lights.

November 12.

Article 13.—The whole question of moderate speed in fog was discussed under an amendment to strike out Article 13.

Dr. Sieveking (Germany) urged that a definition should be given to the term "moderate" for the guidance of Judges and sailors; and proposed the wording, "so far moderate her speed as is consistent with her own safety, and under the circumstances of the case necessary to prevent risk of collision."

Mr. Hall (Great Britain) opposed any change in the Rule on the ground of the impossibility of embracing all possible cases; and that any attempt at precising it might afford an excuse for evading it.

Mr. Goodrich (United States) said that the strength of the law was in its flexibility, and deprecated modification.

The proposal to omit Article 13 was put and lost.

Mr. Goodrich (United States) moved an addition to Article 13, which was supported by *Mr. Hall* (Great Britain) with certain modifications, on the ground that it met the wishes of several of the Delegates as expressed in amendments, and complied with the recommendations of the Sound Signal Committee, besides making law that which practical seamen act upon.

The addition was passed in the following form:—

"A steam-vessel hearing, apparently before her beam, the fog-signal of a vessel the position of which is not ascertained, shall, so far as the circumstances of the case admit, stop her engines, and then proceed with caution until all danger of collision is over."

November 14.

Article 3.—*M. Flood* (Norway) proposed an amendment to the following effect:—

"Art. 3 (*e*). The side lights to be placed in steam-vessels not forward of the mast-head light, and in sailing-vessels as near abreast the foremast as practicable."

He urged this on the ground that it was advisable to define the place where the lights should be placed.

Mr. Hall (Great Britain) opposed the amendment, pointing out that it was practically impossible to assign to the side lights any fixed position with regard to the foremast lights, which would necessitate the alteration, and possibly even reconstruction, of many vessels.

Captain Mensing (Germany) supported the amendment. He said it was in conformity with the Report of the Committee on Lights, and it proposed no hard-and-fast rule, leaving the position of the side lights undefined so long as they were abaft the mast-head light.

The amendment was carried.

The Yeas and Nays were called for, and were as follows:—

Yeas.—Brazil, China, Chile, Denmark, Germany, Norway, Portugal, Russia, Spain, Sweden, the Netherlands, Uruguay.

Nays.—United States, Austria, Belgium, France, Great Britain, Hawaii, Italy, Japan, Mexico.

Note.—See Protocol of the 9th December. The vote was reconsidered and reversed.

Articles 12 and 13.—*M. Flood* (Norway) proposed that the words "heavy rain-storms" should be added, on the ground that there was as much difficulty in seeing during such storms as in falling snow.

The amendment was accepted by *Mr. Hall* (Great Britain), and carried.

The Conference then proceeded to the discussion of the principle of speed.

Dr. Sieveking (Germany) proposed that the wording of the Rule should be, "shall so far moderate her speed as under the circumstances of the case is necessary to prevent a collision."

This, he said, was a necessary definition, as the words of the Article as they stood at present would only imply that the speed must be reduced whether the circumstances required it or not.

Mr. Hall (Great Britain) said that the true meaning of the Rule was perfectly well known to every sailor, and that it was not necessary to modify it.

Mr. Carter (Hawaii) suggested that the addition of the words, "having careful regard to the conditions and circumstances," might reconcile the difference between the two views.

This was accepted by the Delegates from Germany and Great Britain and carried.

A long discussion took place upon an amendment proposed by the Delegates for Germany to the Rule:—

"And when it is safe and practicable and necessary to prevent risk of collision, ships in a fog, mist, or falling snow must lie-to or anchor."

The amendment was put and negatived.

The Conference decided against an amendment to fix the maximum speed to be allowed to ships in fog.

Article 13 was then disposed of.

Steering and Sailing Rules.—*Mr. Hall* (Great Britain) suggested an instruction to sailors in the following words:—

"Risk of collision may, when time permits, be ascertained by carefully watching the compass bearings of an approaching vessel. If the bearings do not appreciably change such risk should be deemed to exist."

This was carried.

November 15.

Article 18.—*Mr. Hall* (Great Britain) proposed that Article 18 be amended so that the holding-on vessel shall keep her course and speed.

The object of the amendment was, he explained, to enable the vessel which has to give way to know what the other ship is going to do, so as to be able to go under her stern if necessary.

Dr. Sieveking (Germany) said that the advantage of the amendment was clear. On the other hand, it increased the difficulties of the position of the holding-on vessel; especially in case the other vessel should be obliged to cross her bow. He wanted to know the opinion of mariners.

Mr. Goodrich (United States) advocated the change as putting an end to the uncertainty which existed in the law at present.

Admiral Molyneux (Great Britain) said that the amendment would remove doubt as to what the action of a ship would be; the holding-on ship is obliged to keep her speed, and the master knows the other ship is not to cross his bow.

Captain Mensing (Germany) said that if it was not an accepted rule that the holding-on ship should keep her speed, the amendment was a necessary one. But he failed to see that there was any necessity for altering the Rule; and argued that there were cases in which the amendment would only lead to embarrassment.

Captain Saldanha de Gama (Brazil), *Commodore Monasterio* (Mexico), *Lieutenant Beaugency* (Chile), and *Captain Richard* (France) spoke in favour of the amendment.

The amendment was put to the Conference and carried.

Mr. Hall (Great Britain) then moved the first part of his amendment to Article 18, which was consequential on the amendment just passed.

The Conference agreed to it in the following form:—

"Every steam-ship which is directed by these Regulations to keep out of the way of another ship shall, on approaching her, if necessary, slacken her speed, or stop or reverse."

Mr. Hall (Great Britain) moved a new Rule, which was carried without discussion, and was as follows:—

"A ship which is required by these Rules to keep out of the way of another ship shall, if the circumstances of the case admit, avoid crossing ahead of the other."

The Conference then considered the proposed Article 22 as drawn up in the London Committee.

Mr. Hall (Great Britain) asked leave to withdraw his proposal, and substitute for it an amendment in the present Article 23, in order to provide for special circumstances where the action of both ships is necessary to avert collision.

Mr. Hall (Great Britain) then moved the new Article 23 of the London Committee, to prevent single ships interfering with squadrons. Consideration was postponed.

November 18.

Article 5.—*Mr. Hall* (Great Britain) moved that the definition of "steam-ship" should be referred to the Collocation Committee, and the question as to the warning signal to be given by any vessel to a vessel approaching, to the Committee on Sound Signals.

Mr. Hall (Great Britain) moved Article 23 of the Rules drawn up by the London Committee as to single ships keeping out of the way of squadrons.

In order to avoid making any provision which it would be difficult for sailing-vessels to comply with (as for instance when hove-to or in a calm), the proposal was amended as follows:—

"In clear weather no vessel shall cross the bows of the leaders of any squadron of ships of war in regular formation, nor pass through the lines of such squadrons; but nothing in this Article shall excuse the ship of war from doing her best to avoid collision."

Consideration was postponed, and the Conference proceeded to the discussion of an amendment to Article 5, already agreed on in principle, which at Mr. Hall's suggestion was modified and carried in the following form:—

"A steam-vessel proceeding under sail and not using her engines shall carry in daytime, in any place of the foretop where it can best be seen, a ball or shape 2 feet in diameter."

Mr. Hall (Great Britain) explained that the object was to provide in daytime against her being mistaken for a ship under steam, owing to the steam escaping from her funnel.

Captain Malmberg (Sweden) proposed a distinctive light for a disabled vessel being towed by a sailing-vessel, but on the difficulty of finding such a light being pointed out to him, he withdrew his amendment.

Article 19.—*Mr. Goodrich* (United States) proposed an amendment to Article 19 (signals for steamers in sight of one another), making them mandatory.

Mr. Hall (Great Britain) spoke in support, on the ground that there was practically a unanimous consensus of opinion among sailors on this point.

Dr. Sieveking (Germany) pointed out the danger likely to arise from mistaking the signals. Moreover, the course to be taken is rigidly laid down by the Rules; the holding-on vessel keeps her course and speed, and it is of no importance to her to know what the other vessel is doing. The advantage of knowing is a moral one merely, and not to be compared to the disadvantage arising from misunderstanding the signals. He also pointed out the legal difficulty caused by the imposition of a new duty on the vessel which is to keep out of the way.

Mr. Goodrich (United States) said it had worked very well in the inland waters of the United States.

Mr. Hall (Great Britain) said the signals were already in constant use at sea. It is a great advantage to the holding-on vessel to know the other vessel sees her. The burden of blowing the whistle is not a very great one.

The amendment was carried.

M. van Steyn (Netherlands) proposed (as already settled in Article 12) to omit the word "steam" in "steam whistle."

The amendment was carried.

Mr. Hall (Great Britain) proposed a definition of the term "short blasts" as a blast of about one second's duration, in order that it should not be confounded with the long blasts prescribed in the Rules.

The amendment was carried.

Article 20.—*Mr. Hall* (Great Britain) proposed the amendment agreed on in the London Committee in order to obviate any doubt as to what "overtaking ship" means.

The amendment was carried.

Article 21.—*M. Flood* (Norway) proposed an amendment to the effect that vessels should reduce their speed in narrow channels.

Mr. Hall (Great Britain) pointed out that it was one of the ordinary precautions seamen were bound to take, and the amendment was withdrawn.

Article 25.—*M. Garde* (Denmark) proposed an addition to the Rule to the effect that the local lights should be additional to the lights used on the high seas, and not be inconsistent with them.

Mr. Hall (Great Britain) and *Dr. Sieveking* (Germany) pointed out that the Sovereign Powers could not be bound as was proposed.

The amendment was withdrawn.

Article 26.—*Captain van Steyn* (Netherlands) proposed an amendment, which at *Mr. Hall's* suggestion was passed in a modified form as follows: to add to Article 26 the words, "or the exhibition of recognition signals adopted by ship-owners, which have been authorized by their respective Governments, duly registered and published to all foreign Governments [provided that the said signals are not so arranged as to cause confusion and mistake]."

Note.—The words in brackets were subsequently struck out in Collocation Committee.

Article 27.—*M. Flood* (Norway) proposed to change the minute gun to a gun fired at short intervals.

The amendment was lost.

Captain van Steyn (Netherlands) proposed an amendment as follows: "a gun or any explosive signal," &c.; which was carried on the understanding that it should be referred to the Committee on Sound Signals.

He also proposed other sound signals which were referred to the same Committee for report.

Preamble.—*Dr. Sieveking* (Germany) proposed a preamble to be inserted before the Rules to the effect that they were applicable to all vessels on the high seas and all navigable waters.

This was referred to the Collocation Committee.

New Article. (*Steamers towing.*)—*Dr. Sieveking* (Germany) proposed a new Article as follows:—

"When a steam-vessel is approaching another vessel which is towing one or more vessels, so as to involve risk of collision, she is to keep out of the way of the vessel towing.

This was opposed by *Mr. Goodrich* (United States), and *Mr. Hall* (Great Britain); and supported by *Captain Bisbee* (China), and *Captain Malmberg* (Sweden).

The amendment was lost.

November 19.

Mr. Shackford (United States) proposed an amendment with reference to the distance at which sound signals should be heard, which was referred to the Collocation Committee with power to prepare a note to be appended to the Regulations.

M. Verbrugghe (Belgium) proposed an amendment for communication lights, which was referred to the Committee on General Division VIII.

Mr. Hall (Great Britain) brought forward his amendment in regard to ships of war in regular formation (Article 23 of the Rules drawn up in London, as amended), which he said was in the interest of sailing-vessels to prevent their running into danger.

It was opposed by *Captain Richard* (France), as conferring a privilege on war-vessels, and as lacking in precision; and also as likely to give rise to general discontent in cases of collision between vessels of different nationality.

Mr. Goodrich (United States) also opposed it on the ground that the mercantile marine were subordinated to war-vessels.

Captain Sampson (United States), *M. Flood* (Norway), and *Dr. Sieveking* (Germany) supported it; the latter suggesting certain modifications.

The amendment was voted on in the following form:—

"In clear weather, at sea, no vessel shall attempt to cross the bow of the leaders of any squadron of three or more ships of war in regular formation, nor unnecessarily to pass through the line of such squadron."

The words "at sea" were inserted to prevent any doubts in regard to inland waters. The word "unnecessarily" was inserted in deference to the Delegate from Norway. The latter part of the proposed Article was omitted as surplusage.

A division was taken, France, Spain, Sweden, the Netherlands, and the United States voting against, the remainder for.

It was therefore carried.

[*Note.*—This Rule was taken out of the Regulations and submitted as a recommendation to the Powers. See Protocol of December 30.]

Article 4. (*Towing Vessels.*)—*Captain Norcross* (United States) proposed, and *Mr. Hall* (Great Britain) accepted an amendment inserting in Rule 4, after the words "6 feet apart" the words, "and when towing more than one vessel, shall carry an additional bright white light 6 feet above or below such light."

The amendment was carried.

Article 23. (*Dangers of Navigation.*)—*Mr. Hall* (Great Britain) proposed to insert the words "collision or other" before "danger" (which he said was in lieu of his former proposal: Article 22 of the London Committee). The object of the amendment was to impress on the minds of sailors that they must not hold on too long to the Rule prescribing that the holding-on ship must keep her speed as well as her course.

He said that after consideration the British Delegates had thought it more desirable to give this warning by explaining the general Rule than by having any special Rule.

The amendment was adopted.

Articles 7, 9, and 10.—The Conference proceeded to discuss the Report of the Committee on Lights for Small Craft.

Mr. Goodrich (United States) moved that the amendments proposed by the Committee should be adopted.

Article 7 was then read as amended by the Report:—

"Art. 7. Whenever, as in the case of small vessels under way during bad weather, the green and red side-lights cannot be fixed, these lights shall be kept at hand, ready for use; and shall, on the approach of or to other vessels, be exhibited on their respective sides

in sufficient time to prevent collision, in such a manner as to make them most visible, and so that the green light shall not be seen on the port side nor the red light on the starboard side, nor if practicable more than two points abaft the beam on their respective sides.

"To make the use of these portable lights more certain and easy, the lanterns containing them shall each be painted outside with the colour of the light they respectively contain, and shall be provided with proper screens."

The Article was adopted without discussion.

Article 9 (*a*) was then proposed:—

"Art. 9 (*a*). A pilot-vessel, whether under sail or steam, when engaged on her station on pilotage duty, shall not carry the lights required for other vessels, but shall carry a white light at the mast-head, visible all round the horizon, and shall also exhibit a flare-up light or flare-up lights at short intervals, which shall never exceed fifteen minutes.

"When approaching a vessel to put a pilot on board, or when there is risk of collision with another vessel, such pilot-vessel shall have at hand two lights, one red and one green, so constructed that they can be flashed instantaneously, which shall be kept either in their places, screened, or on deck on their respective sides of the vessel, always ready for use, and shall flash one of them (in order to show the direction in which she is heading) in sufficient time to prevent collision, so that the red light shall only be shown on the port side, and the green light only on the starboard side."

M. Flood (Norway) proposed to strike out the words "on her station."

Mr. Goodrich (United States) made some observations suggested by the New Jersey and New York pilots, to the effect that the mast-head light should be carried screened, and only unscreened at certain times, instead of side lights as proposed by the Committee.

Sir G. Nares, on the part of the Committee on Lights for Small Craft, said that as long as the pilot-vessel was stationary or hovering about she should be given the white light; when moving as an ordinary vessel she should carry the side lights.

Mr. Goodrich (United States) proposed an amendment embodying his views, to the effect that the mast-head light and coloured side lights should be carried screened, and unscreened under certain circumstances.

But the original paragraph (*a*) as proposed by the Committee was carried.

Paragraph (*b*) was then proposed.

"(*b*.) A pilot-vessel of such a class as to be obliged to go alongside of a vessel to put a pilot on board may show a white light instead of carrying a white light at the mast-head.

"Such vessels shall also not be obliged to carry the side lights proposed for larger pilot-vessels, but in this case they shall have ready at hand a lantern with a green glass on the one side and a red glass on the other side, and on approaching a vessel to put a pilot on board, or on approaching to or being approached by a vessel, such lantern shall be exhibited in sufficient time to prevent collision, so that the green light shall not be seen on the port side, nor the red light on the starboard side."

Sir G. Nares (Great Britain) explained that it was proposed to meet the special case of pilot-vessels which had no boats.

Paragraph (*b*) was adopted.

"(*c*). A pilot-vessel, whether under sail or steam, when not engaged on her station on pilotage duty, shall carry lights similar to those of other vessels."

Paragraph (*c*) was adopted.

"Art. 10. Paragraph (*a*) of this Article applies only to boats and vessels propelled by sails or oars, of less than 20 tons gross tonnage, and only to such boats and vessels when they are under way. It therefore applies also to fishing-vessels of less than 20 tons gross tonnage when they are not actually engaged in fishing, but are under way.

"(*a*.) Boats and vessels of less than 20 tons gross tonnage shall not be obliged to carry the coloured side lights; but every such boat and vessel shall, if she do not carry such coloured side lights, have ready at hand a lantern with a green glass on the one side, and a red glass on the other side, and on approaching to or being approached by another vessel such lantern shall be exhibited in sufficient time to prevent collision, so that the green light shall not be seen on the port side nor the red light on the starboard side."

The proposed Rule was adopted without discussion.

Article 10.—"*Note.* Paragraph (*b*) of this Article applies only to vessels under steam of less than 40 tons gross tonnage, and only to such vessels when they are under way. It therefore applies also to fishing-vessels under steam of less than 40 tons gross tonnage when they are not actually engaged in fishing, but are under way.

"(*b*.) A vessel of less than 40 tons gross tonnage when under steam shall not be obliged

to carry the lights prescribed for other vessels under steam, but if she does not carry such lights she shall carry on or in front of her foremast, or on or in front of her funnel, or somewhere in the fore part of the vessel where it can best be seen, and at a height above the gunwale of not less than 9 feet, a bright white light visible for at least 2 miles, so constructed as to show over an arc of the horizon of twenty points of the compass, so fixed as to throw the light ten points on each side of the vessel, namely, from right ahead to two points abaft the beam on either side; and such vessel shall further carry either (1) side lights visible for at least 1 mile, or (2) a lantern with a green glass on the one side, and a red glass the other, so constructed that it will show an unbroken green light over an arc of the horizon of ten points of the compass from right ahead to two points abaft the beam on the starboard side, and an unbroken red light over an arc of the horizon of ten points of the compass from right ahead to two points abaft the beam on the port side. This lantern shall be carried at not less than 3 feet below the white light before mentioned."

The proposal was adopted without discussion.

" Art. .—(*a.*) All fishing-vessels and fishing-boats of 20 tons gross tonnage, or upwards, when under way and when not required by the following Regulations in this Article to carry and show the lights therein named, shall carry and show the same lights as other vessels under way.

" (*b.*) All vessels and boats when engaged in fishing with drift-nets shall exhibit two white lights from any part of the vessel where they can be best seen. Such lights shall be placed so that the vertical distance between them shall be not less than 6 feet and not more than 10 feet, and so that the horizontal distance between them measured in a line with the keel of the vessel shall be not less than 5 feet and not more than 10 feet. The lower of these two lights shall be the more forward, and both of them shall be of such a character and contained in lanterns of such construction as to show all round the horizon, on a dark night, with a clear atmosphere, for a distance of not less than 3 miles."

Was approved without discussion.

Captain Hubert (Netherlands) proposed an amendment to be put at the end of this paragraph as follows :—

" It is finally understood and agreed that nothing contained in this Article concerning the lights to be carried and shown by fishing-vessels and boats when actually engaged in fishing shall prevent the Government of any maritime country from making Regulations as to the lights to be carried and shown, and the signals to be made by fishing-vessels and boats actually engaged in fishing in the territorial waters of any such State, nor shall it prevent two or more Maritime States, bordering any seas or waters in which boats and vessels of these States fish in common, from mutually agreeing to express Regulations as to the lights to be carried or shown, and the signals to be made by such boats and vessels when engaged in fishing in such waters."

This was carried without discussion.

Article .—" (*c.*) *Note.* The following subsections (*c*), and (*d*) and (*e*) of this Article only apply to vessels engaged in trawl-fishing, by which is meant the dragging of an apparatus along the bottom of the sea attached to any vessel in motion.

" (*c.*) All vessels under steam when engaged in trawling, having their trawls in the water and not being stationary, in consequence of their gear getting fast to a rock or other obstruction, shall carry on or in front of the foremast, and in the same position as the white light which other steam-ships are required to carry, a lantern showing a white light ahead, a green light on the starboard side, and a red light on the port side, such lantern to be so constructed, fitted, and arranged as to show an unbroken white light over an arc of the horizon of four points of the compass, an unbroken green light over an arc of the horizon of ten points of the compass, and an unbroken red light over an arc of the horizon of ten points of the compass, and it shall be so fixed as to show the white light from right ahead to two points on the bow on each side of the vessel, the green light from two points on the starboard bow to four points abaft the beam on the starboard side, and the red light from two points on the port bow to four points abaft the beam on the port side. Such vessels shall also carry a white light in a lantern, so constructed as to show a clear and unbroken light all round the horizon, the lantern containing such white light to be carried lower than the lantern showing the green, white, and red lights, as aforesaid, so, however, that the actual distance between them shall not be less than 6 feet nor more than 12 feet."

The proposal was adopted without discussion.

" (*d.*) All sailing-vessels of 5 tons gross tonnage, and upwards, engaged in trawling, having their trawl in the water, and not being stationary in consequence of their gear getting fast to a rock or other obstruction, shall carry a white light in a globular lantern, so constructed as to show a clear and unbroken light all round the horizon, and also

provide a sufficient supply of red pyrotechnic lights, which shall each burn for at at least thirty seconds, and shall, when so burning, be visible for the same distance under the same conditions as the white light. The white light and one of the pyrotechnic lights shall be shown on approaching to or being approached by another vessel, in sufficient time to prevent collision."

Captain Richard (France) asked what wa sthe object of the provisions as to vessels of 40 and 5 tons. Formerly vessels of 20 tons and over were distinguished.

Captain Donner (Germany) explained that it was thought necessary to arrange special lights for small craft which are not generally sea-going vessels, and for small steamers, as well as for a class of small trawlers on the Baltic which could not carry the fixed mast-head light.

Article. —"All lights mentioned above shall be visible at a distance of 2 miles.

"(*e.*) Sailing vessels of less than 5 tons gross tonnage engaged in trawling, having their trawl in the water, and not being stationary in consequence of their gear getting fast to a rock or other obstruction, shall not be obliged to carry the white light mentioned in section (*d*) of this Article, but, if they do not carry such light, they shall have at hand a lantern showing a bright white light, and shall, on approaching to or being approached by another vessel, exhibit it where it can best be seen in sufficient time to prevent collision; and instead of showing a red pyrotechnic light they may show a flare-up light.

"(*f.*) All vessels and boats when employed in line fishing with their lines out and attached to their lines, and when not at anchor or stationary, shall carry the same lights as vessels when engaged in fishing with drift-nets.

"(*g.*) If a vessel or boat when fishing becomes stationary in consequence of her gear getting fast to a rock or other obstruction, she shall show the light and make the fog-signal for a vessel at anchor.

"(*h.*) Fishing-vessels and boats may at any time use a flare-up in addition to the lights which they are by this Article required to carry and show. All flare-up lights exhibited by a vessel when trawling or fishing with any kind of drag-net shall be shown at the after part of the vessel, excepting that, if the vessel is hanging by the stern to her fishing gear, the flare-up lights shall be exhibited from the bow.

"(*i.*) Every fishing-vessel and every boat when at anchor between sunset and sunrise shall exhibit a white light visible all round the horizon at a distance of at least 1 mile."

The remainder of the proposals of the Committee were carried without discussion.

It being understood by the Conference that Mr. Thomas Gray was obliged to return to England in consequence of illness,

Dr. Sieveking (Germany) proposed, and *Mr. Goodrich* (United States) seconded, a Resolution "that the thanks of the Conference be voted to Mr. Thomas Gray for the very valuable services which he has rendered to the Conference by the assistance which he has given."

The Resolution was carried unanimously.

November 20.

Dr. Sieveking (Germany) proposed an amendment (as paragraph (*k*) to Article), giving vessels fishing with drift-nets and lines the right of way over trawlers.

M. Verbrugghe (Belgium) opposed it.

After some discussion the decision was postponed.

Captain Richard (France) moved the reconsideration of Articles 7, 9, and 10, on the ground that the Conference had decided on them too hastily.

The motion was put and carried.

November 25.

Article 7.—The Report of the Committee on Lights for Small Craft was reconsidered.

Article 7 was carried without discussion.

Article 8.—In Article 8 no alteration was proposed.

Article 9 (*a*).—*Mr. Goodrich* (United States) suggested certain verbal alterations.

Captain Richard (France) pointed out that in many countries there was no distinction made between the lights for fishing-boats and pilot-boats. Was it important to make such a distinction?

Captain Donner (Germany) explained that section (*b*) was introduced at the request of the Delegate for Norway, to meet the requirements of his own pilot-boats.

Mr. Hall (Great Britain) suggested that some form of words should be introduced by

the Collocation Committee to clear up any possibility of doubt that a vessel can use her ordinary side lights instead of other special lights; the white light to be shown first.

This was agreed to.

Article 9 (*a*), with this provision, was carried.

Article 9 (*b*).—*M. Flood* (Norway) proposed to omit it on the ground of the inconvenience and uselessness of the coloured light.

Dr. Sieveking (Germany) said that he hoped the Conference would decide on the question of principle as to whether these small boats should have the right of way or not.

Mr. Hall (Great Britain) said that the question of the sole use of the white light on small boats had been carefully considered by the Committee. If the small boats were absolved from the duty of carrying the coloured lights, difficulties would at once be encountered in regard to the Steering and Sailing Rules.

Captain Donner (Germany), who had voted in the minority in the Committee, said that he and his colleagues were now ready to support the proposed Rule in consideration of the difficulty which would arise in the Sailing Rules if the Rule were not passed.

Mr. Hall (Great Britain) moved an amendment upon M. Flood's amendment to the effect that "it is not desirable to alter subsection (*b*)."

This was carried.

Article 9 (*c*) was carried without discussion.

Article 10 (*a*) was carried without discussion.

Article 10 (*b*).—*Captain Richard* (France) objected to fixing the limit of 40 tons. He preferred 20.

Captain Donner (Germany) on behalf of the Committee explained the reasons which had led them to agree on the Rule.

Paragraph (*b*) was adopted.

Article (*a*) was adopted without discussion.

Article (*b*) was also adopted without discussion.

Article (*c*).—*Captain Richard* (France) objected to the use of the lantern showing the three lights, and to the division of trawling vessels into two categories. He moved to refer the Article back to the Committee.

M. Verbrugghe (Belgium) said sailing trawlers and steam trawlers were under different conditions.

Captain Donner (Germany) agreed.

Mr. Hall (Great Britain) said the light mentioned had been used since 1884.

Sir G. Nares (Great Britain) said it was of very great importance to know by the light that a vessel had a net attached to her. It was difficult to choose any other light.

Captain Richard's motion was lost, and the Rule carried.

November 26.

Article .—The paragraph excepting all territorial waters, if so desired by any Power, from the operation of the Rules for lights on fishing-vessels, and allowing two or more States to make their own arrangements for bordering seas, was then discussed.

Captain Hubert (Netherlands) said the Convention to be held at the Hague had been postponed till after the Conference.

Mr. Goodrich (United States) opposed the insertion of the paragraph as conferring the same powers as Article 25.

Dr. Sieveking (Germany) said any Government had the right of altering the Rules, which did not come into force by Treaty. There was nothing in the way of several Powers agreeing to adopt certain Rules in certain seas. The proviso was already well understood.

Mr. Hall (Great Britain) agreed that the amendment was superfluous.

Captain Richard (France) hoped the amendment would be withdrawn.

Captain Hubert withdrew it.

Article (*d*).—*Captain Settembrini* (Italy) moved an amendment for omitting the red pyrotechnic lights on sailing-trawlers of 5 tons or upwards.

He said the burden of providing these lights was too great for the fishermen of the Mediterranean.

Mr. Hall (Great Britain) suggested that the exception might be made by local rules.

Captain Richard (France) supported Captain Settembrini.

The amendment was carried by a vote of 15 to 8. In the minority voted: Belgium, Germany, Great Britain, Guatemala, Russia, Sweden, the Netherlands, United States.

Mr. Hall (Great Britain) pointed out that the result of the vote was that a sailing-trawler up to 50 tons was not bound to carry anything but a white light.

Mr. Goodrich (United States) proposed the reconsideration of the question.

The motion was carried, and

Mr. Carter (Hawaii) moved to substitute "7" tons for "5" tons. This was carried, and the amended paragraph (*d*) was substituted for Captain Settembrini's amendment, leaving thus the pyrotechnic lights unaltered, but changing the limit from 5 to 7 tons.

Paragraph (*e*), as amended in consequence of the previous amendment (5 to 7 tons), was then passed.

Paragraphs (*f*), (*g*), and (*h*) were carried without discussion.

Article (*i*).—*Mr. Hall* (Great Britain) explained that this paragraph was inserted because the fishermen have an idea that the other Rules did not apply to them.

Article 10 and Article .—*Captain Hubert* (Netherlands) moved to except from these Articles regions where their enforcement would prove too difficult in consequence of local conditions.

Dr. Sieveking (Germany) said that this might be left to the Governments. Foreign Governments could be informed of any changes made in the Rules. A note could be appended to the Rules to that effect.

Captan Hubert withdrew his amendment on that understanding.

Article .—*Dr. Sieveking* (Germany) moved an amendment that sailing-vessels should keep out of the way of sailing-vessels engaged in fishing. He said that he had abandoned his former amendment as to trawlers and fishing-vessels, which question, he said, should be left to the Hague Convention.

After some suggestions from *Mr. Hall* (Great Britain) and *Captain Richard* (France), it was carried in the following form:—

"Sailing-vessels under way shall keep out of the way of sailing-vessels or boats engaged in fishing with their nets, lines, or trawls. In daytime such vessels or boats, when under way, shall indicate their occupation by displaying a basket or other efficient signal where it can best be seen. But this Rule shall not give any vessel or boat engaged in fishing the right of obstructing a fairway used by vessels other than fishing-vessels or boats."

The Conference considered Resolutions proposed on behalf of the Lights Committee to the effect:—

1. That the power of lights should be expressed by referring them to one standard.
2. That the minimum power only should be fixed.
3. Incandescent and not arc lights to be used.
4. That the minimum power of light must be found at every point where the light is visible.
5. Whether the ship is heeled over or not.

These Resolutions were adopted by the Conference on the understanding that they were to be appended as a note to the Report.

The 6th Resolution was adopted after considerable discussion as follows:—

"That the colouring of the glasses by which the colour of the light is to be produced shall be so chosen that, if possible, the red light shall have no admixture of green, nor the green light of red rays, and that both colours can be readily and unmistakably distinguished."

7. That no detailed description of lamps should be internationally adopted.
8. The Regulations should be better enforced.

On *Mr. Hall's* (Great Britain) proposal, the following Resolution was also carried:—

"The above Resolutions of the Committee on Lights, appointed by this Conference, are recommended to the attention of the Powers represented in this Conference."

December 2.

Article 3.—*Captain Shackford* (United States) proposed the optional use of range lights.

Mr. Hall (Great Britain) supported the proposal in regard to the evidence which had been given of the great use of the range lights in inland American waters.

It was carried as follows:—

"All steamers under way may carry an additional white light, similar to the light mentioned in Article 3 (*a*). These lights must be so placed in line with the keel that one must be at least 15 feet higher than the other, and should be in such a position with

reference to each other that the lower light shall be forward of the upper one. The vertical distance between these lights must be less than the horizontal distance."

The Conference refused to adopt an amendment moved by the Spanish Delegates, that all vessels under way should keep out of the way of coupled steamers trawling.

The Additional Report of the Committee on Sound Signals was then considered.

On the reading of the recommendation with regard to pilot signals,

Mr. Hall (Great Britain) moved that the question be referred to the Code Signal Committee, and not embodied in the Rules.

After some discussion on the nature of the signal, the Resolution was passed.

Article 10 (*a*).—The proposed Article 10 (*a*) was read and carried :—

"In fog, mist, falling snow, or heavy rain-storms, a drift-net vessel attached to her nets, and a vessel when trawling, dredging, or fishing with any kind of drag-net, and a vessel employed in line-fishing with her lines out, shall at intervals of not more than one minute make a blast with her fog-horn, followed by ringing her bell."

Article 12 (paragraph 1).—The new Article leaves out "a bellows or other" before "mechanical means," and restricts the use of the gong to Chinese waters, as the gong is frequently used on board light-ships in European waters.

Captain Mensing (Germany) wished the gong to be permissive on all vessels.

The wording finally passed was as follows :—

"Art. 12.—A steam-ship shall be provided with a whistle or siren, sounded by steam or other efficient substitute for steam, so placed that the sound may not be intercepted by any obstructions, with an efficient fog-horn to be sounded by mechanical means, and also with an efficient bell. A sailing-vessel of 20 tons gross tonnage and upwards shall be provided with a similar fog-horn and bell.

"*Note.*—In all cases where the Regulations require a bell to be used, a drum may be substituted on board Turkish vessels, and a gong where such articles are commonly used on board small sea-going vessels."

Article 12 (paragraph 2).—The second paragraph of Article 12 was carried as proposed by the Committee :—

"Sailing-vessels and boats of less than 20 tons gross tonnage shall not be obliged to be provided with a mechanical fog-horn; but if not so provided, they shall make with any other instrument an efficient sound signal at intervals of not less than one minute."

Article 12. (*a*) and (*b*).—After some discussion, in which the importance of avoiding any confusion with the short blast helm-signals was pointed out, the proposals of the Committee were carried in the following modified form :—

"Art. 12 (*a.*) A steam-vessel under way shall make with her whistle or siren, at intervals of not more than two minutes, a prolongedblast of from four to six seconds' duration.

"(*b.*) A steam-vessel not at anchor, but stopped and having no way upon her, shall sound, at intervals of not more than two minutes, two such prolonged blasts with an interval of about one second between them.

No change was proposed in section (*c*).

Captain Shackford (United States) said that one second was too short a time for a blast on a fog-horn.

Sir G. Nares (Great Britain), on the part of the Sound Signal Committee, pointed out that the word "short" was not inserted in this section.

Section (*e*) was proposed as follows :—

"A steam-vessel, when her engines are going full speed astern, shall sound on her whistle three short blasts."

Captain Richard (France) objected to this Rule in cases where the vessels were not in sight of one another; and *Captain Mensing* (Germany) supported him.

The question was voted on, and the amendment was negatived by 15 to 5; Austria, Denmark, Italy, the Netherlands, and the United States voting in the minority.

A long discussion took place over paragraph (*f*), giving a special signal to vessels at anchor at sea in a fairway. It was decided by 12 to 8 that the principle should be adopted, and referred to the Collocation Committee.

France, Germany, Belgium, China, Chile, Russia, Spain, and Sweden voted in the minority.

December 3.

Article 4.—*Captain Salvesen* (Norway) moved that Article 4 be reconsidered so as to allow for the length of the tow.

Mr. Hall (Great Britain) supported the proposal, as according to the present wording a tug would be obliged to hoist a third light if she took even a second barge in tow.

After a long discussion as to the wording of the amendment, the Conference agreed to the following addition to the Rule :—

To add after the words "such lights" the following: "Provided that the length of the tow, measuring from the stern of the towing vessel to the stern of the last vessel towed, exceeds 600 feet."

The amendment of *M. Seoane* (Spain), proposing that all vessels under way should get out of the way of coupled steamers trawling, was discussed.

It was opposed by *Mr. Hall* (Great Britain) on the ground that in adopting the amendment the Conference would be running counter to the general principle of the Rules of the Road at Sea, and that the case was not sufficiently strong to justify such an exception.

The amendment was voted on, and lost by 14 to 9, Belgium, Chile, France, Italy, Mexico, Portugal, Spain, Siam, and Venezuela voting in the minority.

Article 12 (*a*). (*Sound Signals for Tows.*)—On the amendment of the Committee on Sound Signals as to sound signals for tows, considerable differences of opinion arose.

It was resolved, finally, to reconsider the question whether a sound signal was to be adopted for a sailing-vessel towing.

Mr. Hall (Great Britain) stated that he would vote against any special signal, in regard to the facts that the occasions are rare when such signals are wanted, and to the difficulty of finding such a signal at all.

The Conference decided in that sense.

Captain Mensing (Germany) moved that an optional signal should be introduced for use on sailing-vessels.

Seven voted in the affirmative, and 12 in the negative. Belgium, Denmark, Germany, Hawaii, Italy, Japan, and Holland voted in the minority.

Captain Richard (France), with the view to separate the question of a steam-vessel towing from a sailing-vessel towing, proposed the following :—

"A steam-vessel when towing shall at intervals of not more than two minutes sound upon her whistle, siren, or fog-horn three blasts in succession, viz., one prolonged blast followed by two short ones."

This was adopted.

He also moved to reconsider the question of giving sailing-vessels towing a signal.

This was opposed by Captain Mensing (Germany), and the discussion was adjourned. (See 4th December.)

December 4.

The discussion on Captain Richard's amendment (to restore the words "a sailing-vessel") was proceeded with.

Sir G. Nares explained the position of the Committee, and stated his reasons for supporting the amendment.

Captain Donner (Germany) stated that a sailing-ship often took another in tow in the North Sea.

Mr. Hall (Great Britain) said that such exceptional cases might be dealt with by local Rules. He adhered to his objection formerly expressed.

Mr. Carter (Hawaii) said the Rule would be important in the Pacific, where steam-tugs were rare.

Captain Malmberg (Sweden) asked if the signal proposed would override the signals relating to the wind under Article 14, or be additional to them.

It was explained that the signal should override the signals provided for in Article 14.

A vote was taken :—

Eighteen were in the affirmative, 5 in the negative. Belgium, Germany, Great Britain, Mexico, and Russia composed the minority.

Article 12 (*g*).—*Mr. Hall* (Great Britain) proposed to add at the end of the clause the following :—

"When more than one vessel is being towed, each vessel towed shall sound this signal on hearing the sound signal of an approaching vessel."

Captain Richard (France) opposed the addition.

Sir G. Nares (Great Britain), on behalf of the Committee, moved an amendment :—

"A vessel towing shall at intervals of not more than two minutes, and the vessel towed, may sound three blasts in succession, viz., one prolonged blast followed by two short blasts."

The object was, he explained, when several vessels were being towed, to enable each one, if necessary, to give a signal showing that there was yet another vessel behind. It was not proposed that each vessel should repeat the signal the whole time the fog lasted.

A vote was taken, and the paragraph was passed with one dissentient vote (France).

Captain Norcross (United States) moved that the form of signal should be changed.

The motion was lost.

Sir G. Nares (Great Britain), on behalf of the Sound Signal Committee, moved that the signals used by towing-vessels should be in lieu of those provided for in sections (*a*), (*b*), and (*c*,) so that the steamer towing shall not be obliged to make her one blast, and the vessel towed shall not be obliged to make her sailing-vessel's signal.

This was carried.

Mr. Hall (Great Britain) pointed out that the vessel towed was in the category of a sailing-vessel, and therefore the signal must be given on the fog-horn.

The suggestion was adopted.

The whole paragraph (*g*) was then carried as follows :—

"A steam-vessel and a sailing-vessel, when towing, shall, instead of the signals provided under sections (*a*) and (*c*) of this Article, at intervals of not more than two minutes sound on the whistle, siren, or fog-horn three blasts in succession, viz., one prolonged blast followed by two short blasts.

A vessel towed may also give this signal on her fog-horn, but not on her whistle or siren.

Article 12 (*h*).—*Sir G. Nares* (Great Britain) then proposed a signal to indicate, "The way is off my ship, you may feel your way past me."

Captain Malmberg (Sweden) opposed it, as likely to entice steamers to draw too near each other.

Captain Mensing (Germany) also opposed it.

Captain Richard (France) thought the Rule would be better in the Signal Code. Only strictly indispensable sound signals should be inserted in the Rules.

Mr. Hall (Great Britain) said he would vote for the signal, which he thought a good one, if optional. A strong representation had been made by the Board of Trade, and a strong desire for it expressed by sailors. It would be buried in the International Code Signal Book.

The question was put, and carried by 15 to 4 in favour of the signal.

France, Germany, Spain, and Sweden voted in the minority.

Paragraph (*h*) was then carried as follows :—

"A steam-vessel wishing to indicate to another 'The way is off my ship, you may feel your way past me,' may sound on her whistle or siren three blasts, viz., short, long, short, with intervals of about one second between them."

Article 12 (*i*).—*Captain Mensing* (Germany) proposed a special signal for vessels not under command and vessels laying telegraph cables.

Sir G. Nares (Great Britain), on behalf of the Sound Signal Committee, opposed any increase in the number of signals.

Mr. Hall (Great Britain) said he would vote for a signal, but in the hope that one of the existing signals could be utilized.

Captain Richard (France) said the signal was as necessary, and more so, than the last voted on.

The Conference decided by 15 to 4 that a signal should be given. Austria-Hungary, China, Hawaii, and Italy voted in the minority.

The duty of selecting the signal was referred to the Sound Signal Committee.

December 5.

Sir G. Nares (Great Britain), on behalf of the Sound Signal Committee, presented a scheme for the two fog signals for a vessel not under command and a vessel laying or picking up a telegraph cable.

The first proposal made was as follows :—

"A ship under way which is unable to get out of the way of an approaching vessel, through being not under command, or unable to manœuvre as required by these Regulations, shall, on hearing the fog signal of an approaching vessel, sound on her whistle, siren, or fog-horn four short blasts."

It was carried, with the addition of the words "in answer" after "sound," in order to indicate that the signal is to be an answer to each signal sounded by an approaching vessel.

The second proposal was as follows:—

"A ship employed in laying or picking up a telegraph cable shall, on hearing the fog-signal of an approaching vessel, sound in answer on her whistle, siren, or fog-horn three prolonged blasts in succession."

The proposal was carried.

The question of pilot signals was passed over in accordance with a previous Resolution, deciding that the Conference should not discuss them under the Rules of the Road, but should relegate the subject to Committee No. 2, dealing with General Division VIII.

Article 19.—*Sir G. Nares* (Great Britain), on the part of the Sound Signal Committee, proposed to substitute, "My engines are going full speed astern," for the former wording, "I am going full speed astern."

The question was carried.

Article .—On behalf of the Fog Signal Committee, *Sir G. Nares* (Great Britain) moved an amendment on an Article already carried.

After some discussion as to the duration of a flare-up light and other questions, the Article was carried as follows:—

"Art. .—Every ship may, if necessary, in order to attract attention to the lights which she is by these Regulations required to carry, show a flare-up light, or use any detonating signal that cannot be mistaken for a distress signal.

Mr. Goodrich (United States) moved to insert, after the word "attention," the words, "to prevent risk of collision," but the amendment was lost.

Article 27.—*Sir G. Nares* (Great Britain) moved an amendment to the distress signals during day: to add—

"4. Rockets or shells bursting in the air with a loud report, and throwing stars of any colour or description, fired one at a time, at short intervals.

"5. A continuous sounding with any fog signal apparatus."

These signals were adopted by the Sound Signal Committee, as referred to them by the Conference.

The Conference passed the additions proposed.

Sir G. Nares (Great Britain) then moved an additional distress signal for the night:—

"4. A continuous sounding with any fog signal apparatus," which was also carried.

The question was then discussed as to whether a pilot-vessel wishing to offer her pilotage services should be given a special fog signal for that purpose.

Sir G. Nares (Great Britain), on behalf of the Fog Signal Committee, advocated such a special signal.

A division was taken: 11 voted for and 9 against. France, Germany, Great Britain, Hawaii, Mexico, Portugal, Russia, Sweden, and the Netherlands voted in the minority.

The Conference also decided that a signal should be found for a vessel wanting a pilot.

Mr. Hall then moved that Committee No. 2 be requested to report as to the nature of the signals for pilots; such signals having no connection with the Rules of the Road.

The motion was carried.

December 9.

On the motion of *Mr. Goodrich* (United States), the Conference decided unanimously against the adoption of course-indicating sound signals in foggy or thick weather.

An intercalatory Report from the Collocation Committee was read recommending the reconsideration of M. Flood's (Norway) amendment to Article 3, passed November 14, as to the position of the side lights.

The Conference determined to reconsider the question, and referred it to the Committee on Lights.

The Report of the Committee upon the subject of a uniform load mark was read.

Mr. Hall (Great Britain) stated that though most anxious that the matter should become a subject for international agreement, yet, having regard to the fact that the Committee reported it as not ripe for consideration by the Conference, he would bow to the decision of the Committee.

The Report of the Committee was adopted unanimously.

The Report of the Committee upon Division XIII (the establishment of a permanent International Marine Commission) was then read.

The minority Report of M. August Schneider (Denmark) was also read.

M. Schneider hoped that the question would be left open, so that any Government, when the time was ripe, could launch the plan again.

M. Flood (Norway) supported this proposal.

Dr. Sieveking (Germany) opposed it. He pointed out the impracticable nature of the scheme for a Maritime Commission, and thought that the wording of the Report was sufficient.

M. Garde (Denmark) said that he had no instructions from his Government, but thought that much good would result from the establishment of a Bureau which should lay before every Marine Conference particular proposals submitted by private persons.

Mr. Hall (Great Britain, Chairman of the Committee) pointed out that such a Bureau did not come under the consideration of the Committee.

The Report of the Committee was adopted.

December 12.

M. Flood (Norway) proposed his Resolution recommending to the Powers the advisability of a Bureau of Maritime Information.

M. Garde (Denmark) explained that what was wanted in his country was not a permanent Commission, but a link or medium between the different countries where proposals could be sent from any country which does not have a regular Board of Trade. He instanced the Telegraphic Convention of 1885, by which a Central Institution was established.

Mr. Hall (Great Britain, Chairman of the Committee on Division XIII) opposed the proposal, which amounted, he said, to a demand on the part of the Powers which had no Board of Trade for an international one, of which Great Britain should pay 65 per cent. of the expenses. The Powers could consider the question, if they chose, without any recommendation from the Conference. The Scandinavian Powers, if they desired it, could form a Bureau of their own.

Dr. Sieveking (Germany) said the German Government was opposed to the scheme. He saw no real difference between the Bureau and the Commission against which the Committee had reported. Most Governments had their Boards of Trade, and discussed matters of common interest internationally. The Bureau would only result in loss of time.

Captain Sampson (United States) saw a great difference between a Commission and a Bureau. He instanced the International Bureau of Weights and Measures. The Committee on Buoyage could testify to the expense caused by the want of a uniform system. A Bureau might put an end to such diversity.

The Resolution was put in the following words :—

"That the Conference recommend that the advisability of a Bureau of Maritime Information should be considered by the Governments of the maritime nations."

Seven voted in the affirmative and 12 in the negative. Denmark, Hawaii, Japan, Norway, Siam, the Netherlands, and the United States voted in the minority.

December 16.

Article 3.—*M. Flood's* (Norway) amendment as to the position of the side lights was reconsidered.

A Report of the Committee on Lights was read, recommending that the Rule should stand as it was, except as regards sailing-vessels, provided it was adopted universally.

Mr. Hall (Great Britain) pointed out that great expense would be incurred by existing steam-vessels, some of which would have to be reconstructed. As regards sailing-vessels, the Report of the Committee was conclusively against the proposal.

M. Flood reiterated his arguments.

Dr. Sieveking said that, in view of the objections of Great Britain, he would not vote for the insertion of the Rule into the Regulations. A recommendation might be made in a similar sense and appended to the Rules.

M. Flood's amendment was lost.

Dr. Sieveking (Germany) moved a Resolution—

"That it is approved by the Conference, and recommended to the attention of the Powers represented thereat, that green and red side lights should be placed in steam-vessels not forward of the masthead light, and that this Resol tion be inserted in Appendix 3 to the Report of the Committee on Collocation of the Rules."

The Resolution was adopted.

The Report of the Committee on Life-saving Systems and Devices was read.

The several Resolutions proposed in the Report were put to the Conference.

Resolution 1. (See Protocol, 20th December.)

Resolutions 2 and 3 were carried.

Resolution No. 4 was amended, on *Mr. Hall's* (Great Britain) proposal, by the substitution of the word "uniform" for "a set of," so as to read, "prepare uniform instructions," and carried in that form.

In the fourth paragraph of the Resolution the word "pyrotechnic" was inserted on *Captain Mensing's* (Germany) proposal, so as to read "blue pyrotechnic light."

The fifth Resolution was carried without change, and the Report adopted in its entirety by the Conference.

The Report of the Committee on General Divisions II, IV, and VI was read and considered.

The Report on General Division II was adopted.

In the Report on General Division IV, *Captain Richard* (France) moved that the smallest letters of the name of a ship should not be less that 8 inches high.

The proposal was lost by 9 votes to 10. Belgium, China, Chile, France, Russia, Spain, Sweden, Siam, and the Netherlands voted in the minority.

The Conference adopted the first proposition in the Report of the Committee on Division IV.

After some discussion as to the character to be used in the designation of the draught, the second proposition was carried.

The Report of the Committee in General Division VI was read.

Captain Richard (France) objected to the imposition of tests for colour-blindness.

Captain Sampson (United States) pointed out that the Committee had only recommended that each Government should provide a place where men and boys who propose to go to sea could have their eyesight tested. It was a voluntary matter.

Mr. Hall (Great Britain) agreed that it would be impossible to make the recommendation into a Rule.

Captain Richard (France) said he only desired guarantees of this sort for master mariners.

Captain Sampson (United States) agreed, and quoted instances showing the danger of not having such tests.

Mr. Hall (Great Britain) said that if such examinations were instituted it would prevent men from going to sea who could never rise to the grade of an officer.

Captain Richard (France) moved to strike out the last three lines of paragraph No. 1 ("and no man or boy should be permitted to serve on board any vessel in the capacity of seaman, or where he will have to stand look-out, whose visual power is below one-half normal, or who is red or green colour-blind").

The motion was lost. France, Germany, Mexico, Russia, and Siam voting in the minority.

Paragraph 2 was adopted, *Captain Richard* (France) suggesting the addition of the words, "or as a pilot."

The third paragraph was adopted without alteration.

The Report as amended was adopted.

The Report of Committee No. 2, Division VII (Ocean Laws), was then read.

After some discussion as to the precautions to be taken by fishermen on the Banks, the Report was adopted.

The Report of Committee No. 2 on Division VIII (Night Signals for communicating Information at Sea) was read and adopted.

December 18.

The Report of the Collocation Committee was read.

An amendment put by *Captain Shackford* (United States) to strike out "two" and substitute "three" before miles in the last line of Article 2 (*b*) and (*c*) was lost.

Dr. Sieveking (Germany) moved an amendment in Article 2 (*d*) to insert the words, "more than half a point," after the word "seen."

Mr. Hall (Great Britain) moved, in lieu of this amendment, to insert as a note to Appendix (B) the following:—

"Side lights should be so screened as to prevent the most convergent rays of the lights being seen more than half a point across the bows."

Captain Salvesen (Norway) moved that the Conference adopt the Rules of the Board of Trade as to the screening of side lights.

Mr. Hall's amendment was carried, after a long discussion, by 16 to 3. Austria, Russia, and the United States voted in the minority.

Dr. Sieveking (Germany) moved in Article 4 (*a*), instead of the words, "in the same

position," to insert the words, "at the same height," and after the words, "Article 2 (*a*)," nsert the words "where they can best be seen."

Mr. Hall (Great Britain) supported the amendment on the grounds that it might be difficult for a vessel out of command to hoist a light in front of the foremast, or it might be desirable to hoist it aft.

It was carried by 10 votes to 9. Brazil, Belgium, China, Chile, France, Mexico, Sweden, Siam, and the Netherlands voted in the minority.

Captain Mensing (Germany) proposed in Article 4 (*a*) to strike out the words, "in globular lanterns" and insert, after "visible," the words, "all around the horizon."

Mr. Hall (Great Britain) supported the change, on the ground that the best lanterns were flat at top and bottom.

The amendment was carried.

The same change was made in Article 4 (*b*).

Dr. Sieveking (Germany) moved an amendment in Article 7, 1 (*b*), as to the position of the lanterns, which was lost.

December 19.

Mr. Goodrich (United States) moved an amendment, which was originally proposed by the British Delegates, to Article 22:—

"When, in consequence of thick weather or other causes, two ships find themselves so close to each other as to make it doubtful whether by the action of one ship alone a collision can be avoided, the ship which by the above Article is directed to keep her course and speed shall also take such action as will best avoid collision."

He said he was acting by the advice of a distinguished New York Judge. He thought it was necessary to place this provision so as to catch the mariner's eye immediately after the Rule which provides that the holding-on ship should keep her course and speed.

Mr. Hall (Great Britain) pointed out that the proposed amendment had been withdrawn in deference to the wishes of the Conference, and other words introduced into the general Rule to make it apply to cases of collision.

Dr. Sieveking (Germany) strongly opposed the amendment, on the ground that it made the application of the new Rule as to keeping speed doubtful. He said that if the amendment were accepted it would entail the reconsideration of all the Rules.

Mr. Hall (Great Britain) said that he would bow to the former decision of the Conference, and vote against reconsideration. The whole matter had been most carefully discussed.

On the vote for reconsideration being taken, the United States were in a minority of one.

Mr. Hall (Great Britain) moved an amendment to Article 7 (*c*) as follows:—

"Small steam-boats, such as are carried by sea-going vessels, may carry the white light at a less height than 9 feet above the gunwale, but it must be carried above the combined lantern mentioned in (*b*)."

This was to meet the case of boats which could not conveniently have masts.

It was carried.

Dr. Sieveking (Germany) moved to add to Articles 7 and 9 the words, "The vessels referred to in this Article shall also not be obliged to carry the light prescribed by Article 4 (*a*) and Article 11, last paragraph."

This was to correct an oversight, as it was not intended that small craft should carry the out-of-command lights and lights for vessels aground.

It was carried.

Captain Malmberg (Sweden) proposed an amendment, which was carried in the following modified form:—

Article 8. At the beginning insert the word "near" before "approach."

Dr. Sieveking (Germany) proposed an amendment which, at *Mr. Hall's* suggestion, was modified and carried in the following form:—

Article 8, paragraph 2. Instead of the words "have at hand temporarily," insert the words, "shall have their side lights lighted ready for use, and shall flash or show them at short intervals."

Paragraph 3 to be struck out.

It was carried.

Dr Sieveking (Germany) proposed in Article 9, (*b*) 1, to read, instead of "four" points abaft the beam, "two" points, in order that the light should show in the same way as the side lights.

The amendment was carried.

Captain Settembrini (Italy) moved an amendment, which he modified at *Mr. Hall's* suggestion, and which was passed in the following form:—

"In the Mediterranean Sea, all vessels referred to in subsection (*b*) 2 may show the flare-up light instead of the pyrotechnic light."

Dr. Sieveking (Germany) moved to insert in Article 2, instead of the words, "in a globular lantern so constructed," the words, "of such a character."

This was adopted.

December 20.

Dr. Sieveking (Germany) proposed in Article 21, instead of the words "and speed," to insert the words, "and where one of two crossing vessels is to keep out of the way the other shall keep her course and speed."

He said that the Rule as it stood was applicable to overtaken vessels, and that he desired to except them from the Rule.

Mr. Hall (Great Britain) opposed the change. What was wanted was a general rule which would clear up the doubt as to the meaning of the phrase "keep your course." He was against exceptions.

Mr. Goodrich (United States) pointed out that the addition of the words "and collision" in Rule 28 covered exceptional cases in which strict adherence to Rule 21 would be dangerous.

A vote was taken, and resulted in 2 votes for and 16 against; Germany and Siam voting in the minority.

Captan Richard (France) moved an amendment to eliminate Article 27 from the Regulations, and to add it to Appendix (B) of the Report as a Resolution recommended to the consideration of the Powers.

He said that the rule as to ships of war in line might lead to international difficulties.

Mr. Hall acceded to the proposal, which was adopted.

Captain Sampson (United States) proposed to omit the words, "and collision," after "navigation," in Article 28.

Mr. Hall pointed out that the words had been inserted in order to point out to the sailor that the holding-on vessel was bound to do what she could to prevent collision.

Ten voted in the affirmative, and 10 in the negative, so the amendment was not carried. Brazil, Chile, Denmark, France, Germany, Russia, Spain, Siam, and the Netherlands voted with the United States.

Various verbal corrections were proposed and considered, and the discussion on the Rules was brought to an end.

Mr. Goodrich (United States) proposed to insert in the Rules a provision as to the duty of masters to afford assistance in case of collision, taken from the English Act.

Captain Richard (France) objected to its insertion in the Rules, as it required legislative sanction.

Mr. Goodrich moved that the Resolution should be annexed to the Rules in the Appendix.

It was passed in the following form:—

"In every case of collision between two vessels it shall be the duty of the master or person in charge of each vessel, if and so far as he can do so without serious danger to his own vessel, crew, and passengers (if any), to stay by the other vessel until he has ascertained that she has no need of further assistance, and to render to the other vessel, her master, crew, and passengers (if any), such assistance as may be practicable and as may be necessary in order to save them from any danger caused by the collision, and also to give to the master or person in charge of the other vessel the name of his own vessel and her port of registry, or the port or place to which she belongs, and also the name of the ports and places from which, or to which, she is bound."

December 30.

Captain Richard (France) proposed that a Final Act be prepared, to be signed by the President, showing the Resolutions adopted by the Conference.

The proposal was carried.

The Report of General Division IX was adopted.

The Report of General Division XII was also adopted after some discussion as to the rules as to buoyage in American waters.

Mr. Goodrich (United States) proposed that the Final Report of the Collocation Committee be adopted.

Mr. Verney (Siam) desired further consideration of the Rules as drawn up, on the ground that they needed more careful editing.

Mr. Goodrich's motion was, however, adopted, and the Rules, as amended, carried

December 31.

The Reports on General Divisions X and XI were read and adopted.

Mr Hall proposed, and *Admiral Kaznakoff* (Russia) seconded, a vote of thanks to the President, Rear-Admiral Franklin, which was carried.

Dr. Sieveking (Germany) proposed, and *Captain Richard* (France) seconded, a vote of thanks to the Secretaries.

The Conference was then declared at an end.

Appended is a copy of the Rules of the Road as finally adopted, and of the Resolutions connected therewith.

The Resolutions based upon the Reports will be found under Inclosure 16.

Appendix (A.)

REGULATIONS FOR PREVENTING COLLISIONS AT SEA.

Preliminary.

THESE Rules shall be followed by all vessels upon the high seas and in all waters connected therewith, navigable by sea-going vessels.

In the following Rules every steam-vessel which is under sail and not under steam is to be considered a sailing-vessel, and every vessel under steam, whether under sail or not, is to be considered a steam-vessel.

The word "steam-vessel" shall include any vessel propelled by machinery.

A vessel is "under way" within the meaning of these Rules, when she is not at anchor, or made fast to the shore, or aground.

Rules concerning Lights, &c.

The word "visible" in these Rules when applied to lights shall mean visible on a dark night, with a clear atmosphere.

Article 1. The Rules concerning lights shall be complied with in all weathers from sunset to sunrise, and during such time no other lights which may be mistaken for the prescribed lights shall be exhibited.

Art. 2. A steam-vessel when under way shall carry—

(*a.*) On or in front of the foremast, or if a vessel without a foremast, then in the fore part of the vessel, at a height above the hull of not less than 20 feet, and if the breadth of the vessel exceeds 20 feet, then at a height above the hull not less than such breadth, so, however, that the light need not be carried at a greater height above the hull than 40 feet, a bright white light, so constructed as to show an unbroken light over an arc of the horizon of 20 points of the compass, so fixed as to throw the light 10 points on each side of the vessel, viz., from right ahead to 2 points abaft the beam on either side, and of such a character as to be visible at a distance of at least 5 miles.

(*b.*) On the starboard side a green light so constructed as to show an unbroken light over an arc of the horizon of 10 points of the compass, so fixed as to throw the light from right ahead to 2 points abaft the beam on the starboard side, and of such a character as to be visible at a distance of at least 2 miles.

(*c.*) On the port side a red light so constructed as to show an unbroken light over an arc of the horizon of 10 points of the compass, so fixed as to throw the light from right ahead to 2 points abaft the beam on the port side, and of such a character as to be visible at a distance of at least 2 miles.

(*d.*) The said green and red side-lights shall be fitted with inboard screens projecting at least 3 feet forward from the light, so as to prevent these lights from being seen across the bow.

(*e.*) A steam-vessel when under way may carry an additional white light similar in construction to the light mentioned in subdivision (*a*). These two lights shall be so placed in line with the keel that one shall be at least 15 feet higher than the other, and in such a position with reference to each other that the lower light shall be forward of the upper one. The vertical distance between these lights shall be less than the horizontal distance.

Art. 3. A steam-vessel when towing another vessel shall, in addition to her side-lights, carry two bright white lights in a vertical line one over the other, not less than 6 feet apart, and when towing more than one vessel shall carry an additional bright white light 6 feet above or below such lights, if the length of the tow measuring from the stern of the towing-vessel to the stern of the last vessel towed exceeds 600 feet. Each of these lights shall be of the same construction and character, and shall be carried in the same position, as the white light mentioned in Article 2 (*a*), excepting the additional light, which may be carried at a height of not less than 14 feet above the hull.

Such steam-vessel may carry a small white light abaft the funnel or aftermast for the vessel towed to steer by, but such light shall not be visible forward of the beam,

Art. 4. (*a.*) A vessel which from any accident is not under command shall carry at the same

height as the white light mentioned in Article 2 (*a*), where they can best be seen, and if a steam-vessel, in lieu of that light, two red lights, in a vertical line one over the other, not less than 6 feet apart, and of such a character as to be visible all round the horizon at a distance of at least 2 miles; and shall by day carry in a vertical line one over the other, not less than 6 feet apart, where they can best be seen, two black balls or shapes, each 2 feet in diameter.

(*b.*) A vessel employed in laying or in picking up a telegraph cable shall carry in the same position as the white light mentioned in Article 2 (*a*), and if a steam-vessel, in lieu of that light, three lights in a vertical line one over the other, not less than 6 feet apart. The highest and lowest of these lights shall be red, and the middle light shall be white, and they shall be of such a character as to be visible all round the horizon, at a distance of at least 2 miles. By day she shall carry in a vertical line one over the other, not less than 6 feet apart, where they can best be seen, three shapes not less than 2 feet in diameter, of which the highest and lowest shall be globular in shape and red in colour, and the middle one diamond in shape and white.

(*c.*) The vessels referred to in this Article, when not making way through the water, shall not carry the side-lights, but when making way shall carry them.

(*d.*) The lights and shapes required to be shown by this Article are to be taken by other vessels as signals that the vessel showing them is not under command, and cannot therefore get out of the way.

These signals are not signals of vessels in distress and requiring assistance. Such signals are contained in Article 31.

Art. 5. A sailing-vessel under way, and any vessel being towed, shall carry the same lights as are prescribed by Article 2 for a steam-vessel under way, with the exception of the white lights mentioned therein, which they shall never carry.

Art. 6. Whenever, as in the case of small vessels under way during bad weather, the green and red side-lights cannot be fixed, these lights shall be kept at hand, lighted and ready for use; and shall, on the approach of or to other vessels, be exhibited on their respective sides in sufficient time to prevent collision, in such manner as to make them most visible, and so that the green light shall not be seen on the port side nor the red light on the starboard side, nor if practicable more than 2 points abaft the beam on their respective sides.

To make the use of these portable lights more certain and easy, the lanterns containing them shall each be painted outside with the colour of the light they respectively contain, and shall be provided with proper screens.

Art. 7. Steam-vessels of less than 40, and vessels under oars or sails, of less than 20 tons, gross tonnage, respectively, when under way, shall not be obliged to carry the lights mentioned in Article 2 (*a*), (*b*), and (*c*), but if they do not carry them they shall be provided with the following lights:—

1. Steam-vessels of less than 40 tons shall carry:

(*a.*) In the fore part of the vessel, or on or in front of the funnel, where it can best be seen, and at a height above the gunwale of not less than 9 feet, a bright white light constructed and fixed as prescribed in Article 2 (*a*), and of such a character as to be visible at a distance of at least 2 miles.

(*b.*) Green and red side-lights constructed and fixed as prescribed in Article 2 (*b*) and (*c*), and of such a character as to be visible at a distance of at least 1 mile, or a combined lantern showing a green light and a red light from right ahead to 2 points abaft the beam on their respective sides. Such lantern shall be carried not less than 3 feet below the white light.

2. Small steam-boats, such as are carried by sea-going vessels, may carry the white light at a less height than 9 feet above the gunwale, but it shall be carried above the combined lantern mentioned in subdivision 1 (*b*).

3. Vessels under oars or sails, of less than 20 tons, shall have ready at hand a lantern with a green glass on one side and a red glass on the other, which, on the approach of or to other vessels, shall be exhibited in sufficient time to prevent collision, so that the green light shall not be seen on the port side nor the red light on the starboard side.

The vessels referred to in this Article shall not be obliged to carry the lights prescribed by Article 4 (*a*) and Article 11, last paragraph.

Art. 8. Pilot-vessels, when engaged on their station on pilotage duty, shall not show the lights required for other vessels, but shall carry a white light at the mast-head, visible all round the horizon, and shall also exhibit a flare-up light or flare-up lights at short intervals, which shall never exceed 15 minutes.

On the near approach of or to other vessels they shall have their side-lights lighted, ready for use, and shall flash or show them at short intervals, to indicate the direction in which they are heading, but the green light shall not be shown on the port side, nor the red light on the starboard side.

A pilot-vessel of such a class as to be obliged to go alongside of a vessel to put a pilot on board may show the white light instead of carrying it at the masthead, and may, instead of the coloured lights above mentioned, have at hand ready for use a lantern with a green glass on the one side and a red glass on the other, to be used as prescribed above.

Pilot-vessels, when not engaged on their station on pilotage duty, shall carry lights similar to those of other vessels of their tonnage.

Art. 9. Fishing-vessels and fishing-boats, when under way and when not required by this Article to carry or show the lights therein named, shall carry or show the lights prescribed for vessels of their tonnage under way.

(*a.*) Vessels and boats when fishing with drift-nets shall exhibit two white lights from any part of the vessel where they can best be seen. Such lights shall be placed so that the vertical distance between them shall be not less than 6 feet and not more than 10 feet, and so that the horizontal distance between them, measured in a line with the keel, shall be not less than 5 feet and not more than 10 feet. The lower of these two lights shall be the more forward, and both of them shall be of such a character as to show all round the horizon, and to be visible at a distance of not less than 3 miles.

(*b.*) Vessels when engaged in trawling, by which is meant the dragging of an apparatus along the bottom of the sea—

1. If steam-vessels, shall carry in the same position as the white light mentioned in Article 2 (*a*) a tricoloured lantern so constructed and fixed as to show a white light from right ahead to 2 points on each bow, and a green light and a red light over an arc of the horizon from 2 points on either bow to 2 points abaft the beam on the starboard and port side respectively; and not less than 6 nor more than 12 feet below the tricoloured lantern, a white light in a lantern, so constructed as to show a clear, uniform, and unbroken light all round the horizon.

2. If sailing-vessels of 7 tons gross tonnage and upwards shall carry a white light in a lantern so constructed as to show a clear, uniform, and unbroken light all round the horizon, and shall also be provided with a sufficient supply of red pyrotechnic lights, which shall each burn for at least thirty seconds, and shall be shown on the approach of or to other vessels in sufficient time to prevent collision.

In the Mediterranean Sea the vessels referred to in subdivision (*b*) 2 may use a flare-up light in lieu of a pyrotechnic light.

All lights mentioned in subdivision (*b*) 1 and 2 shall be visible at a distance of at least 2 miles.

3. If sailing-vessels of less than 7 tons gross tonnage, shall not be obliged to carry the white light mentioned in subdivision (*b*) 2 of this Article, but if they do not carry such light they shall have at hand, ready for use, a lantern showing a bright white light, which shall, on the approach of or to other vessels, be exhibited where it can best be seen, in sufficient time to prevent collision; and they shall also show a red pyrotechnic light, as prescribed in subdivision (*b*) 2, or in lieu thereof a flare-up light.

(*c.*) Vessels and boats when line-fishing with their lines out and attached to their lines, and when not at anchor or stationary, shall carry the same lights as vessels fishing with drift-nets.

(*d.*) Fishing-vessels and fishing-boats may at any time use a flare-up light in addition to the lights which they are by this Article required to carry and show. All flare-up lights exhibited by a vessel when trawling or fishing with any kind of drag-net shall be shown at the after-part of the vessel, excepting that, if the vessel is hanging by the stern to her fishing-gear, they shall be exhibited from the bow.

(*e.*) Every fishing-vessel and every boat when at an anchor shall exhibit a white light visible all round the horizon at a distance of at least 1 mile.

(*f.*) If a vessel or boat when fishing becomes stationary in consequence of her gear getting fast to a rock or other obstruction, she shall show the light and make the fog signal prescribed for a vessel at anchor respectively. (See Article 15 (*d*), (*e*), and last paragraph.)

(*g.*) In fog, mist, falling snow, or heavy rain-storms, drift-net vessels attached to their nets, and vessels when trawling, dredging, or fishing with any kind of drag-net, and vessels line-fishing with their lines out, shall, if of 20 tons gross tonnage or upwards, respectively, at intervals of not more than 1 minute, make a blast; if steam-vessels, with the whistle or siren, and if sailing vessels, with the fog-horn, each blast to be followed by ringing the bell.

(*h.*) Sailing-vessels or boats fishing with nets or lines, or trawls, when under way, shall in daytime indicate their occupation to an approaching vessel by displaying a basket, or other efficient signal, where it can best be seen.

The vessels referred to in this Article shall not be obliged to carry the lights prescribed by Article 4 (*a*) and Article 11, last paragraph.

Art. 10. A vessel which is being overtaken by another shall show from her stern to such last-mentioned vessel a white light or a flare-up light.

The white light required to be shown by this Article may be fixed and carried in a lantern, but in such case the lantern shall be so constructed, fitted, and screened that it shall throw an unbroken light over an arc of the horizon of 12 points of the compass, viz., for 6 points from right aft on each side of the vessel, so as to be visible at a distance of at least 1 mile. Such light shall be carried as nearly as practicable on the same level as the side-lights.

Art. 11. A vessel under 150 feet in length, when at anchor, shall carry forward, where it can best be seen, but at a height not exceeding 20 feet above the hull, a white light, in a lantern so constructed as to show a clear, uniform, and unbroken light, visible all round the horizon at a distance of at least 1 mile.

A vessel of 150 feet or upwards in length, when at anchor, shall carry, in the forward part of the vessel, at a height of not less than 20 and not exceeding 40 feet above the hull, one such light, and at or near the stern of the vessel, and at such a height that it shall be not less than 15 feet lower than the forward light, another such light.

The length of a vessel shall be deemed to be the length appearing in her certificate of registry.

A vessel aground in or near a fairway shall carry the above light or lights and the two red lights prescribed by Article 4 (*a*).

Art. 12. Every vessel may, if necessary, in order to attract attention, in addition to the lights which she is by these Rules required to carry, show a flare-up light, or use any detonating signal that cannot be mistaken for a distress signal.

Art. 13. Nothing in these Rules shall interfere with the operation of any special Rules made by the Government of any nation with respect to additional station- and signal-lights for two or more ships of war, or for vessels sailing under convoy, or with the exhibition of recognition signals adopted by ship-owners, which have been authorized by their respective Governments and duly registered and published.

Art. 14. A steam-vessel proceeding under sail only, but having her funnel up, shall carry in daytime, forward, where it can best be seen one black ball or shape 2 feet in diameter.

Sound-Signals for Fog, &c.

Art. 15. All signals prescribed by this Article for vessels under way shall be given:

1. By "steam-vessels," on the whistle or siren.

2. By "sailing-vessels and vessels towed," on the fog-horn.

The words "prolonged blast" used in this Article shall mean a blast of from four to six seconds' duration.

A steam-vessel shall be provided with an efficient whistle or siren, sounded by steam, or some substitute for steam, so placed that the sound may not be intercepted by any obstruction, and with an efficient fog-horn, to be sounded by mechanical means, and also with an efficient bell.* A sailing-vessel of 20 tons gross tonnage or upwards shall be provided with a similar fog-horn and bell.

In fog, mist, falling snow, or heavy rain-storms, whether by day or night, the signals described in this Article shall be used as follows, viz.:—

(*a.*) A steam-vessel having way upon her shall sound, at intervals of not more than two minutes, a prolonged blast.

(*b.*) A steam-vessel under way, but stopped and having no way upon her, shall sound, at intervals of not more than two minutes, two prolonged blasts, with an interval of about one second between them

(*c.*) A sailing-vessel under way shall sound, at intervals of not more than one minute, when on the starboard tack, one blast, when on the port tack, two blasts in succession, and when with the wind abaft the beam, three blasts in succession.

(*d.*) A vessel when at anchor shall, at intervals of not more than one minute, ring the bell rapidly for about five seconds.

(*e.*) A vessel at anchor at sea, when not in ordinary anchorage ground, and when in such a position as to be an obstruction to vessels under way, shall sound, if a steam-vessel, at intervals of not more than two minutes, two prolonged blasts with her whistle or siren, followed by ringing her bell; or, if a sailing-vessel, at intervals of not more than one minute, two blasts with her fog-horn, followed by ringing her bell.

(*f.*) A vessel when towing shall, instead of the signals prescribed in subdivisions (*a*) and (*c*) of this Article, at intervals of not more than two minutes, sound three blasts in succession, viz., one prolonged blast followed by two short blasts. A vessel towed may give this signal, and she shall not give any other.

(*g.*) A steam-vessel wishing to indicate to another, "The way is off my vessel, you may feel your way past me," may sound three blasts in succession, viz., short, long, short, with intervals of about one second between them.

(*h.*) A vessel employed in laying or in picking up a telegraph cable shall, on hearing the fog-signal of an approaching vessel, sound in answer three prolonged blasts in succession.

(*i.*) A vessel under way which is unable to get out of the way of an approaching vessel through being not under command, or unable to manœuvre as required by these Rules, shall, on hearing the fog-signal of an approaching vessel, sound in answer four short blasts in succession.

Sailing-vessels and boats of less than 20 tons gross tonnage shall not be obliged to give the above-mentioned signals, but if they do not, they shall make some other efficient sound-signal at intervals of not more than one minute.

Speed of Ships to be Moderate in Fog, &c.

Art. 16. Every vessel shall, in a fog, mist, falling snow, or heavy rain-storms, go at a moderate speed, having careful regard to the existing circumstances and conditions.

A steam-vessel hearing, apparently forward of her beam, the fog-signal of a vessel the position of which is not ascertained, shall, so far as the circumstances of the case admit, stop her engines, and then navigate with caution until danger of collision is over.

Steering and Sailing Rules.

Preliminary.—Risk of Collision.

Risk of collision can, when circumstances permit, be ascertained by carefully watching the compass-bearing of an approaching vessel. If the bearing does not appreciably change, such risk should be deemed to exist.

Art. 17. When two sailing-vessels are approaching one another so as to involve risk of collision, one of them shall keep out of the way of the other as follows, viz.:—

(*a.*) A vessel which is running free shall keep out of the way of a vessel which is close-hauled.

(*b.*) A vessel which is close-hauled on the port tack shall keep out of the way of a vessel which is close-hauled on the starboard tack.

(*c.*) When both are running free, with the wind on different sides, the vessel which has the wind on the port side shall keep out of the way of the other.

(*d.*) When both are running free, with the wind on the same side, the vessel which is to windward shall keep out of the way of the vessel which is to leeward.

(*e.*) A vessel which has the wind aft shall keep out of the way of the other vessel.

* In all cases where the Rules require a bell to be used a drum may be substituted on board Turkish vessels, or a gong where such articles are used on board small sea-going vessels.

Art. 18. When two steam-vessels are meeting end on, or nearly end on, so as to involve risk of collision, each shall alter her course to starboard, so that each may pass on the port side of the other.

This Article only applies to cases where vessels are meeting end on, or nearly end on, in such a manner as to involve risk of collision, and does not apply to two vessels which must, if both keep on their respective courses, pass clear of each other.

The only cases to which it does apply are when each of the two vessels is end on, or nearly end on, to the other; in other words, to cases in which, by day, each vessel sees the masts of the other in a line, or nearly in a line, with her own; and by night, to cases in which each vessel is in such a position as to see both the side-lights of the other.

It does not apply, by day, to cases in which a vessel sees another ahead crossing her own course; or by night, to cases where the red light of one vessel is opposed to the red light of the other, or where the green light of one vessel is opposed to the green light of the other, or where a red light without a green light, or a green light without a red light, is seen ahead, or where both green and red lights are seen anywhere but ahead.

Art. 19. When two steam-vessels are crossing, so as to involve risk of collision, the vessel which has the other on her own starboard side shall keep out of the way of the other.

Art. 20. When a steam-vessel and a sailing-vessel are proceeding in such directions as to involve risk of collision, the steam-vessel shall keep out of the way of the sailing-vessel.

Art. 21. Where by any of these Rules one of two vessels is to keep out of the way, the other shall keep her course and speed.

Art. 22. Every vessel which is directed by these Rules to keep out of the way of another vessel, shall, if the circumstances of the case admit, avoid crossing ahead of the other.

Art. 23. Every steam-vessel which is directed by these Rules to keep out of the way of another vessel shall, on approaching her, if necessary, slacken her speed or stop or reverse.

Art. 24. Notwithstanding anything contained in these Rules, every vessel overtaking any other shall keep out of the way of the overtaken vessel.

Every vessel coming up with another vessel from any direction more than two points abaft her beam, *i.e.*, in such a position, with reference to the vessel which she is overtaking that at night she would be unable to see either of that vessel's side-lights, shall be deemed to be an overtaking vessel; and no subsequent alteration of the bearing between the two vessels shall make the overtaking vessel a crossing vessel within the meaning of these Rules, or relieve her of the duty of keeping clear of the overtaken vessel until she is finally past and clear.

As by day the overtaking vessel cannot always know with certainty whether she is forward of or abaft this direction from the other vessel, she should, if in doubt, assume that she is an overtaking vessel and keep out of the way.

Art. 25. In narrow channels every steam-vessel shall, when it is safe and practicable, keep to that side of the fairway or mid-channel which lies on the starboard side of such vessel.

Art. 26. Sailing-vessels under way shall keep out of the way of sailing-vessels or boats fishing with nets, or lines, or trawls. This Rule shall not give to any vessel or boat engaged in fishing the right of obstructing a fairway used by vessels other than fishing-vessels or boats.

Art. 27. In obeying and construing these Rules due regard shall be had to all dangers of navigation and collision, and to any special circumstances which may render a departure from the above Rules necessary in order to avoid immediate danger.

Sound-Signals for Vessels in Sight of one another.

Art. 28. The words "short blast" used in this Article shall mean a blast of about one second's duration.

When vessels are in sight of one another, a steam-vessel under way, in taking any course authorized or required by these Rules, shall indicate that course by the following signals on her whistle or siren, viz.:—

One short blast to mean, "I am directing my course to starboard."

Two short blasts to mean, "I am directing my course to port."

Three short blasts to mean, "My engines are going full speed astern.

No Vessel, under any circumstances, to neglect proper Precautions.

Art. 29. Nothing in these Rules shall exonerate any vessel, or the owner, or master, or crew thereof, from the consequences of any neglect to carry lights or signals, or of any neglect to keep a proper look-out, or of the neglect of any precaution which may be required by the ordinary practice of seamen, or by the special circumstances of the case.

Reservation of Rules for Harbours and Inland Navigation.

Art. 30. Nothing in these Rules shall interfere with the operation of a special Rule, duly made by local authority, relative to the navigation of any harbour, river, or inland waters.

Distress Signals.

Art. 31. When a vessel is in distress and requires assistance from other vessels or from the shore, the following shall be the signals to be used or displayed by her, either together or separately, viz.:—

In the daytime—

1. A gun fired at intervals of about a minute;
2. The International Code signal of distress indicated by N C;

3. The distant signal, consisting of a square flag, having either above or below it a ball or anything resembling a ball;

4. Rockets or shells as prescribed below for use at night;

5. A continuous sounding with any fog-signal apparatus.

At night—

1. A gun fired at intervals of about a minute;

2. Flames on the vessel (as from a burning tar-barrel, oil-barrel, &c.);

3. Rockets or shells, bursting in the air with a loud report and throwing stars of any colour or description, fired one at a time at short intervals;

4. A continuous sounding with any fog-signal apparatus.

Appendix (B.)

The following Resolutions have been approved of by the Conference, and are recommended to the attention of the Powers represented thereat:—

1. The power of all lights should be expressed by referring them all to one standard, by which the light issuing from the lantern should be measured.

2. The minimum power only of each light should be definitely fixed, leaving it to the judgment of the parties responsible for fitting out the vessels with proper lanterns to employ lamps of this or greater power.

3. The use of incandescent lamps should be permitted; the use of arc lights at present should be excluded for all purposes other than signalling and searching.

4. Each lantern should be so constructed that the minimum power of light can be found at every point where the light is to be visible, after the lamp has been fitted with proper screens.

5. The lanterns should be so constructed as to insure the light having at least the required minimum power in the ideal line connecting the lantern with the horizon, even though the vessel be heeled one way or the other 10 degrees.

6. The colour of the glasses by which the colouring of the light is to be produced should be so chosen that, if possible, the red light shall have no admixture of green, nor the green light of red rays, and that both colours can be readily and unmistakably distinguished.

7. No detailed description should be internationally adopted for the construction of the lamp or lantern, so that a fair chance may be given to inventors to produce serviceable articles.

8. The side-lights should be so screened as to prevent the most convergent rays of the lights being seen across the bows more than half a point.

9. The side-lights should be placed in steam-vessels not forward of the mast-head light.

10. To meet the number of complaints as to the absence of proper lights on sailing-vessels, the attention of the Powers is called to the better enforcement of the Regulations in that behalf.

11. All steam-whistles, sirens, fog-horns, and bells should be thoroughly tested as to their efficiency, and should be capable of being heard at a stated minimum distance, and should be so regulated that the tones of whistles and sirens should be as distinct as possible from the sound of fog-horns.

12. Steam-vessels should be provided, if possible, with means of blowing off surplus steam when the engines are stopped, in such a manner as to occasion as little noise as possible.

13. In clear weather at sea no vessel should attempt to cross the bows of the leaders of any squadron of three or more ships of war in regular formation, nor unnecessarily to pass through the lines of such squadron.

14. In every case of collision between two vessels it should be the duty of the master or person in charge of each vessel, if and so far as he can do so without serious danger to his own vessel, crew, and passengers (if any), to stay by the other vessel until he has ascertained that she has no need of further assistance, and to render to the other vessel, her master, crew, and passengers (if any), such assistance as may be practicable and as may be necessary in order to save them from any danger caused by the collision, and also to give to the master or person in charge of the other vessel the name of his own vessel and her port of registry, or the port or place to which she belongs, and also the name of the ports and places from which, and to which, she is bound.

Inclosure 3 in No. 139.

Report of the Committee appointed to prepare the Material for Printing the International Rules of the Road: together with Memoranda of Changes in the Rules of any Powers other than Great Britain, in accordance with the Resolution of October 17, 1889.

Committee:

Dr. F. SIEVEKING, *Delegate from Germany.*
Mr. FREDERICK W. VERNEY, *Delegate from Siam.*
SHIUZO TSUKAHARA, *Delegate from Japan.*

YOUR Committee, in presenting the following Report, desire to inform the Conference that they have not been furnished with the Regulations for Preventing Collisions at Sea in use by the following Powers:—

China,	Nicaragua,
Costa Rica,	Russia,
Guatemala,	Spain,
Hawaii,	Uruguay,
Honduras,	Venezuela.

In the event of these being forthcoming, the Committee are ready to compare them with those of Great Britain in the form of a Supplementary Report.

(Signed) DR. F. SIEVEKING,
October 28, 1889. *Chairman of the Committee.*

Preambles.

GREAT BRITAIN.

At the Court at Osborne House, Isle of Wight, the 11th day of August, 1884.

Present:

THE QUEEN'S MOST EXCELLENT MAJESTY IN COUNCIL.

Whereas by Order in Council made in pursuance of "The Merchant Shipping Act Amendment Act, 1862," and dated the 14th day of August, 1879, Her Majesty, on the joint recommendation of the Admiralty and the Board of Trade, was pleased to direct that, on and after the 1st day of September, 1880, the Regulations for Preventing Collisions at Sea contained in an Order in Council dated the 9th day of January, 1863, and the additions by an Order in Council dated the 13th day of June, 1868, made thereto, should be annulled, and that there should be substituted therefor the new Regulations contained in the first Schedule to the said first-named Order in Council, and that the same should, from and after the 1st day of September, 1880, apply to ships of the countries mentioned in the said second Schedule thereto, whether within British jurisdiction or not;

And whereas by the Orders in Council dated, respectively, the 24th day of March, 1880, the 26th day of August, 1881, the 18th day of August, 1882, the 23rd day of August, 1883, and the 2nd day of February, 1884, Her Majesty was pleased to direct that the operation of the Article numbered 10, of the new Regulations, contained in the first Schedule of the said Order in Council of the 14th day of August, 1879, should be suspended from time to time;

And whereas the Admiralty and the Board of Trade have jointly recommended to Her Majesty that, so far as regards British ships and boats, the Regulations hereinafter set forth shall be substituted for the Regulations contained in the first Schedule to the said Order in Council of the 14th day of August, 1879;

Now, therefore, Her Majesty, by virtue of the powers vested in her by the said

recited Act, and by and with the advice of Her Privy Council, is pleased to direct that, on and after the 1st day of September, 1884, the Regulations contained in the Schedule hereto shall, so far as regards British ships and boats, be substituted for the Regulations contained in the first Schedule to the said Order in Council of the 14th day of August, 1879.

(Signed) C. L. Peel.

United States.

An Act to adopt the "Revised International Regulations for Preventing Collisions at Sea."

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that the following "Revised International Rules and Regulations for Preventing Collisions at Sea" shall be followed in the navigation of all public and private vessels of the United States upon the high seas and in all coast waters of the United States, except such as are otherwise provided for, namely:—

* * * * * *

Belgium.

1er *Août*, 1880. *Arrêté Royal portant un nouveau Règlement des Feux et Signaux en temps de Brume pour prévenir les Abordages.*

Léopold II, &c.,

Nous avons arrêté et arrêtons:

Article 1er. A dater du 1er Septembre, 1880, les bâtiments de la Marine de l'État, ainsi que les navires nationaux du commerce, seront assujettis aux prescriptions ci-après, qui ont pour objet de prévenir les abordages.

Denmark.

We, Christian IX, &c., order that the following Rules for preventing collisions be observed by masters of steam-ships and sailing-ships:—

* * * * * *

Royal Order, 18th February, 1887.

France.

Le Président de la République Française décrète:—

Article 1er. A dater du 1er Septembre, 1884, les bâtiments de la Marine Nationale, ainsi que les navires du commerce Français, ont à se conformer au Règlement ayant pour objet de prévenir les abordages, annexé au présent Décret.

Germany.

(*No.* 1355.) *Verordnung zur Verhütung des Zusammenstossens der Schiffe auf See. Vom 7. Januar* 1880.

Wir, Wilhelm, von Gottes Gnaden Deutscher Kaiser, König von Preussen, &c.,

Verordnen im Namen des Reichs, auf Grund des § 145 des Strafgesetsbuchs (Reichs-Gesetsbl. 1876 S. 40) zur Verhütung des Zusammenstossens der Schiffe auf See, unter Aufhebung der Verordnung vom 23. Dezember 1871 (Reichs-Gesetsbl. S. 475), was folgt:

Jeder Schiffsführer hat auf See und auf den mit der See im Zusammenhange stehenden, von Seeschiffen befahrenen Gewässern die nachstehenden Vorschriften zu befolgen, auch dafür zu sorgen, dass die zur Ausführung derselben erforderlichen Signalapparate vollständig und in brauchbarem Zustande auf seinem Schiffe vorhanden sind.

Japan.

Notification No. 35 of Daijkwan, 16th day, 7th month, 13th year of Meiji, 1880.

The following Regulations for Prevention of Collisions at Sea shall come into operation on and after the 1st day of the 9th month of the present year, and the existing Regulations (Notification No. 5 of Daijkwan, of the 7th year of Meiji, 1874), shall be, on and after that date, hereby annulled :—

Regulations for Preventing Collisions between Vessels.—Royal Order, 28th January 1885.

On board all Norwegian vessels the following Rules for Preventing Collisions shall be observed :—

* * * * * *

Siam.

Rules and Regulations for Steam-ships and Sailing-vessels.

Chow Prayah Bhanuwmgse Mahah Kosa Tibodee t'ee Praklang, Minister for Foreign Affairs, having received a command from His Majesty the King of Siam, that inasmuch as Siamese steam-ships and sailing-vessels trading to foreign ports, and foreign vessels which come for purposes of trade to Bangkok and the coast of Siam, are much more numerous than formerly, and inasmuch as accidents, from collisions between such steam-ships and sailing-vessels, sometimes occur at sea in Siamese waters and in the rivers, giving rise to law-suits difficult of decision, for the reason that there are as yet no laws for large steam-ships and sailing-vessels ; therefore His Majesty has thought fit that Regulations should be made, supplementary to the Harbour Laws, in order that when law-suits shall arise they may be decided with ease. It has pleased His Majesty, therefore, to command that a Code of Laws be enacted like the Rules in force in Europe, which may be used by Siamese and European vessels.

Great Britain—

Article 1. In the following Rules every steam-ship which is under sail and not under steam is to be considered a sailing-ship, and every steam-ship which is under steam, whether under sail or not, is to be considered a ship under steam.

Article 3. A sea-going steam-ship, when under way, shall carry—

(*a.*) On or in front of the foremast, at a height above the hull of not less than 20 feet, and if the breadth of the ship exceeds 20 feet, then at a height above the hull not less than such breadth, a bright white light, so constructed as to show an uniform and unbroken light over an arc of the horizon of twenty points of the compass, so fixed as to throw the light ten points on each side of the ship, namely, from right ahead to two points abaft the beam on either side, and of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 5 miles.

(*b.*) On the starboard side a green light, so constructed as to show an uniform and unbroken light over an arc of the horizon of ten points of the compass, so fixed as to throw the light from right ahead to two points abaft the beam on the starboard side, and of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 2 miles.

(*c.*) On the port side a red light, so constructed as to show an uniform and unbroken light over an arc of the horizon of ten points of the compass, so fixed as to throw the light from right ahead to two points abaft the beam on the port side, and of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 2 miles.

(*d.*) The said green and red side-lights shall be fitted with inboard screens projecting at least 3 feet forward from the light, so as to prevent these lights from being seen across the bow.

UNITED STATES—

Identical.

AUSTRIA-HUNGARY—

Identical, with the following exceptions:

1. The word "sea-going," in line 1, is omitted.
2. Sub-section (*a*). Substitute for the words "20 feet" "6 metres," and in sub-section (*d*), for the words "3 feet" "90 centim."

BELGIUM—

Identical, with the following exceptions:

1. Sub-sections (*a*) and (*d*). Substitute for the words "20 feet" and "3 feet" the words "6 metres" and "91 centim." respectively; and
2. Sub-sections (*a*), (*b*), and (*c*). Substitute for the words, "with a clear atmosphere," the words "sans brume, pluie, brouillard, ou neige."

CHILE—

Identical, with the following exceptions:

1. Sub-section (*a*). Instead of the words, "on or in front of the foremast" to the words "such breadth," inclusive, substitute the words (translation), "on the top of the foremast, or at least at the same height and in front of it."
2. Sub-section (*d*). Instead of the words "3 feet," substitute the words "90 centim."

DENMARK—

Identical, with the following exception:

In line 1, omit the word "sea-going."

FRANCE—

Identical, with the following exception:

Sub-sections (*a*) and (*d*). Instead of the words "20 feet" and "3 feet," substitute the words "6 metres" and "91 centim." respectively.

GERMANY—

Identical, with the following exceptions:

1. In line 1 the word "sea-going" is omitted.
2. Sub-sections (*a*) and (*d*). Instead of the words "20 feet" and "3 feet," substitute the words "6 metres" and "91 centim." respectively.

ITALY—
Identical, with the following exceptions:
1. In line 1 the word "sea-going" is omitted.
2. Sub-sections (*a*) and (*d*). Instead of the words "20 feet" and "3 feet," substitute the words "6 metres" and "90 centim." respectively.

JAPAN—
Identical.

MEXICO—
Identical, with the following exceptions:
1. In line 1 the word "sea-going" is omitted.
2. Sub-sections (*a*) and (*d*). Instead of the words "20 feet" and "3 feet," substitute the words "6 metres" and "90 centim." respectively.

NORWAY—
Identical, with the following exceptions:
1. In line 1, instead of the words "a sea-going steam-ship," substitute "a steam-vessel."
2. Sub-sections (*a*) and (*d*). Instead of the words "20 feet" and "3 feet," substitute the words "6 metres" and "92 centim." respectively.

Instead of the words "3 feet," substitute the words "9 decim."

GREAT BRITAIN—
Article 5. (*a.*) A ship, whether a steam-ship or a sailing-ship, which from any accident is not under command, shall at night carry, in the same position as the white light which steam-ships are required to carry, and if a steam-ship, in place of that light, three red lights in globular lanterns, each not less than 10 inches in diameter, in a vertical line, one over the other, not less than 3 feet apart, and of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 2 miles, and shall by day carry, in a vertical line, one over the other, not less than 3 feet apart, in front of, but not lower than, her fore-mast-head, three black balls or shapes, each 2 feet in diameter.

(*b.*) A ship, whether a steam-ship or a sailing-ship, employed in laying or in picking up a telegraph cable, shall at night carry, in the same position as the white light which steam-ships are required to carry, and if a steam-ship, in place of that light, three lights in globular lanterns, each not less than 10 inches in diameter, in a vertical line, over one another, not less than 6 feet apart. The highest and lowest of these lights shall be red, and the middle light shall be white, and they shall be of such a character that the red lights shall be visible at the same distance as the white light. By day she shall carry, in a vertical line, one over the other, not less than 6 feet apart, in front of, but not lower than, her fore-mast-head, three shapes not less than 2 feet in diameter, of which the top and bottom shall be globular in shape and red in colour, and the middle one diamond in shape and white.

(*c.*) The ships referred to in this Article, when not making any way through the water, shall not carry the side-lights, but when making way shall carry them.

(*d.*) The lights and shapes required to be shown by this Article are to be taken by other ships as signals that the ship showing them is not under command, and cannot, therefore, get out of the way. The signals to be made by ships in distress and requiring assistance are contained in Article 27.

UNITED STATES—

Identical.

AUSTRIA-HUNGARY—

(Translation.)

A ship, whether a steam-ship or a sailing-ship, employed in laying or picking up a telegraph cable, and also a ship which, from any accident, is not under command, shall by day carry in front of, but not lower than, her foremast-head, three dark balls or other signal shapes, not less than 65 centim. in diameter, in a vertical line, one over the other, not less than 1 metre apart.

Such ships shall, at night, carry in the same position as the white light which steam-ships are required to carry, and if a steam-ship, in place of that light, three red lights in globular lanterns, each not less than 25 centim. in diameter, in a vertical line, one over the other, not less than 1 metre apart.

These signal shapes and lights are to be taken by other ships as signals that the ship showing them is not under command, and cannot, therefore, get out of the way.

The aforesaid ships, when not making any way, shall not carry the side-lights, but when making way shall carry them.

BELGIUM—

Tout navire à voiles ou à vapeur employé, soit à poser, soit à relever un câble télégraphique, tout navire qui, par une cause accidentelle, n'est pas libre de ses mouvements, doit, si c'est le jour, porter en avant de la tête du mât de misaine, et pas plus bas que cette tête de mât, trois boules noires de 61 centim. de diamètre chacune, placées verticalement l'une au-dessus de l'autre à une distance d'au moins 91 centim. ; si c'est pendant la nuit, il doit mettre à la place assignée au feu blanc brillant que les bâtiments à vapeur sont tenus d'avoir en avant du mât de misaine, trois feux rouges placés dans les lanternes sphériques d'au moins 25 centim. de diamètre, et disposées verticalement à une distance l'une de l'autre d'au moins 91 centim.

Ces boules ou ces lanternes servent à avertir les autres navires qui approchent que celui qui les porte n'est pas manœuvrable et par suite ne peut se garer.

Les navires ci-dessus ne doivent pas avoir les feux de côté allumés lorsqu'ils n'ont aucun sillage. Ils doivent, au contraire, les tenir allumés s'ils sont en marche soit à la voile, soit à la vapeur.

CHILE—

(Translation.)

The signals indicated in this Article are special signals, and are only carried by the ships which are defined as follows :—

1. The steamers employed in laying or taking up submarine telegraph cables.
2. The steamers which, from any accident, are not under command.

These ships shall carry by day, in front of the foremast, at a height not exceeding the top of the foremast, three globular shapes of black colour, each 60 centim. in diameter, in a vertical line, and not less than 90 centim. apart.

At night the same vessels shall, instead of the mast-head light, carry three red lights in globular lanterns, each not less than 25 centim. in diameter, in a vertical line, and not less than 90 centim. apart.

The aforesaid shapes and lights indicate that the ships showing them are not under command and cannot manœuvre.

The ships referred to in this Article, when not making any way through the water, shall not carry any side-lights, but when making way shall carry them.

DENMARK—

Identical, with the following exception :

Sub-section (*d*). The words beginning, "The signals," to the end of the sub-section, are omitted.

FRANCE—

Identical, with the following exceptions :—

Sub-sections (*a*) and (*b*). Instead of the words "10 inches," substitute the words "25 centim.;" and instead of the words "2 feet," substitute the words "61 centim."

Sub-section (*a*). Instead of the words "3 feet," substitute the words "91 centim."
Sub-section (*b*). Instead of the words "6 feet," substitute the words "1 metre 82 centim."
Sub-section (*a*). After the words "three black balls," the words "or shapes" are omitted.

GERMANY—

GREAT BRITAIN—
Article 10. Open boats and fishing-vessels of less than 20 tons net registered tonnage, when under way and not when having their nets, trawls, dredges, or lines in the water, shall not be obliged to carry the coloured side-lights; but every such boat and vessel shall in lieu thereof have ready at hand a lantern with a green glass on the one side, and a red glass on the other side, and on approaching to or being approached by another vessel, such lantern shall be exhibited in sufficient time to prevent collision, so that the green light shall not be seen on the port side, nor the red light on the starboard side.

The following portion of this Article applies only to fishing-vessels and boats when in the sea off the coast of Europe lying north of Cape Finisterre:

(*a.*) All fishing-vessels and fishing-boats of 20 tons net registered tonnage or upward, when under way and when not having their nets, trawls, dredges, or lines in the water, shall carry and show the same lights as other vessels under way.

(*b.*) All vessels when engaged in fishing with drift-nets shall exhibit two white lights from any part of the vessel where they can best be seen. Such lights shall be placed so that the vertical distance between them shall be not less than 6 feet and not more than 10 feet, and so that the horizontal distance between them, measured in a line with the keel of the vessel, shall be not less than 5 feet and not more than 10 feet. The lower of these two lights shall be the more forward, and both of them shall be of such a character and contained in lanterns of such construction as to show all round the horizon, on a dark night, with a clear atmosphere, for a distance of not less than 3 miles.

(*c.*) All vessels when trawling, dredging, or fishing with any kind of drag-nets shall exhibit, from some part of the vessel where they can be best seen, two lights. One of these lights shall be red, and the other shall be white. The red light shall be above the white light, and shall be at a vertical distance from it of not less than 6 feet and not more than 12 feet; and the horizontal distance between them, if any, shall not be more than 10 feet. These two lights shall be of such a character and contained in lanterns of such construction as to be visible all round the horizon, on a dark night, with a clear atmosphere, the white light to a distance of not less than 3 miles, and the red light of not less than 2 miles.

(*d.*) A vessel employed in line-fishing, with her lines out, shall carry the same lights as a vessel when engaged in fishing with drift-nets.

(*e.*) If a vessel, when fishing with a trawl, dredge, or any kind of drag-net, becomes stationary in consequence of her gear getting fast to a rock or other obstruction, she shall show the light and make the fog-signal for a vessel at anchor.

(*f.*) Fishing-vessels and open boats may at any time use a flare-up in addition to the lights which they are by this Article required to carry and show. All flare-up lights exhibited by a vessel when trawling, dredging, or fishing with any kind of drag-net shall be shown at the after part of the vessel, excepting that if the vessel is hanging by the stern to her trawl, dredge, or drag-net they shall be exhibited from the bow.

(*g.*) Every fishing-vessel and every open boat when at anchor between sunset and sunrise shall exhibit a white light, visible all round the horizon, at a distance of at least 1 mile.

(*h.*) In a fog a drift-net vessel attached to her nets, and a vessel when trawling, dredging, or fishing with any kind of a drag-net, and a vessel employed in line-fishing with her lines out, shall, at intervals of not more than two minutes, make a blast with her fog-horn and ring her bell alternately.

UNITED STATES—

Identical.

AUSTRIA-HUNGARY—

Open fishing-vessels, and other open boats are not required to carry side-lights like other ships, but, if they are not in possession of such lights, they shall carry a lantern with a green glass on the one side, and a red glass on the other side. On approaching to or being approached by another ship, such lantern shall be exhibited in sufficient time to prevent collision, so that the green light shall not be seen on the port side, nor the red light on the starboard side.

These vessels, if at anchor, or fast to their nets, and therefore not making way through the water, shall show a bright white light. They are allowed besides, if they think it advisable, to show flare-up lights from time to time.

BELGIUM—

(*a.*) Les bateaux de pêche non pontés et tout autres bateaux non pontés ne sont pas forcés, lorsqu'ils sont en marche, de porter les feux de côte obligatoires pour les autres navires; mais s'ils ne les ont pas, ils doivent avoir à la place une lanterne toute prête et munie sur un des côtes d'un verre vert, et sur l'autre d'un verre rouge, et s'ils approchent d'un navire ou s'ils en voient approcher un, ils doivent montrer la lanterne assez à temps pour éviter un abordage, en la tenant de manière que la lumière verte ne soit vue qu'à tribord et la lumière rouge à bâbord.

(*b.*) Tout bâtiment de pêche ou tout bateau non ponté doit montrer un feu blanc brillant quand il est au mouillage.

(*c.*) Tout bâtiment de pêche occupé à la pêche au filets trainants portera à l'un de ses mâts deux feux rouges placés verticalement l'un au-dessus de l'autre, à une distance d'au moins 91 centim.

(*d.*) Tout bateau pêchant à la drague portera à l'un de ses mâts deux feux placés verticalement à la distance d'au moins 91 centim. l'un au-dessus de l'autre, le feu supérieur étant rouge et le feu inférieur vert; en outre, il aura les deux feux de côté réglementaires pour les autres bâtiments, ou, s'il ne peut pas les porter, il aura tout prêts et à la main les feux colorés prévus par l'Article 7, ou enfin une lanterne avec un verre rouge et un verre vert comme il est dit au paragraphe (*a*) de cet Article 10.

(*e.*) Les bâtiments de pêche, ainsi que les bateaux non pontés, pourront, en outre, s'ils le désirent, se servir d'un feu à éclats alternativement montré et caché.

(*f.*) Tous les feux exigés par cet Article, à l'exception des feux de côté, doivent être contenus dans des lanternes sphériques, de manière que la lumière soit visible sans interruption sur tout l'horizon.

CHILE—

(*a.*) Open fishing-boats and other open boats are not required to carry the side-lights prescribed for other vessels, but, if they do not carry such lights, they shall use a lantern with a green glass on the one side, and a red glass on the other side, so that, on approaching to or being approached by another vessel, they may exhibit a light in sufficient time to prevent a collision, taking care always that the green light cannot be seen on the port side nor the red light on the starboard side.

(*b.*) Fishing-boats or other open boats, when at anchor, shall carry a white light.

(*c.*) Boats fishing with drift-nets or floating-nets shall carry two coloured lights in a vertical line, and 90 centim. apart.

(*d.*) Vessels engaged in fishing with ground-nets or drag-nets shall carry at one of their masts two lights in a vertical line, the upper red, and the lower green. Besides these, they shall be provided with the side-lights, or, in case they have no side-lights, with the lights prescribed by Article 7, and if they have no such lights, they shall use the light referred to in sub-section (*a*) of this Article.

(*e.*) The vessels referred to in this Article may use an additional white light, and exhibit the same at intervals as often as necessary.

DENMARK—

(Translation.)

Open fishing-boats, as well as other open boats, whether under sail or rowing, are not required to carry the side-lights prescribed for other vessels; but, if they do not

carry them, they shall, instead of them, have ready at hand a lantern with a green glass on the one side, and a red glass on the other side. The lantern shall be exhibited in time to prevent a collision, so that the green light shall not be seen on the port side, nor the red light on the starboard side.

All sorts of fishing-boats, as well as open boats, when engaged in fishing, or when lying at anchor, shall show a clear white light from sunset to sunrise, from any part of the vessel where it can best be seen, visible all round the horizon, at a distance of at least 1 mile. These vessels may also, if they think it advisable, show flare-up lights, from time to time. Vessels engaged in fishing with trawls, ground-nets, or any sort of drag-nets, shall, in such a case, show red flare-up lights. In thick weather the aforesaid vessels shall indicate their presence by blowing their fog-horn at least every two minutes. Sailing fishing-boats, as well as other sailing or rowing boats, of 4 tons net register or less, are not required to show the aforesaid lights.

FRANCE—

Identical, with the following exceptions:

Sub-section *b*. Instead of the words "6 feet," "10 feet," and "5 feet," substitute the words "1 metre 80 centim.," "3 metres" and "1 metre 50 centim." respectively.

GERMANY—

(Translation.)

Open fishing-boats and other open boats are only required to show a bright white light. In addition they may use a flare-up light.

ITALY—

Identical from the beginning of the Article down to the words "on the starboard side," inclusive.

Instead of the words beginning "The following portion" down to the end of the Article, substitute the following:

(Translation.)

Fishing-boats and open boats, when at anchor, shall from sunset to sunrise exhibit a white light visible all round the horizon at a distance of at least 1 mile.

Fishing-boats having their nets in the water shall, in addition to the aforesaid lights, show another white light, at short intervals, at a place where it cannot be mistaken for the light prescribed for pilot-vessels in Article 9. In fog every fishing-boat which has its nets or lines in the water shall, at intervals of not less than two minutes, blow the fog-horn or ring the bell alternately.

JAPAN—

Open fishing-boats and other open boats shall not be required to carry the side-lights required for other vessels; but shall, if they do not carry such lights, carry a lantern having a green slide on the one side, and a red slide on the other side; and on the approach of or to other vessels, such lantern shall be exhibited in sufficient time to prevent collision, so that the green light shall not be seen on the port side, nor the red light on the starboard side.

Fishing-vessels and open boats, when at anchor or attached to their nets, shall exhibit a bright white light.

Fishing-vessels and open boats shall use a flare-up if considered expedient. They shall not be prevented from using a fog-horn by day or night.

MEXICO—

(Translation.)

Open fishing-boats and other open boats are not required to carry the side-lights prescribed for other vessels; but, if they do not carry such lights, they shall use a lantern with a green glass on the one side, and a red glass on the other side, so that, on approaching a vessel, they may exhibit this light in time to prevent a collision, taking care always that the green light shall not be seen on the port side, nor the red light on the starboard side.

Open fishing-boats and other open boats, when at anchor, or when engaged in fishing, and not making way through the water, shall exhibit a white light.

These boats may, if they think it advisable, show an additional light at short intervals.

NORWAY—

Identical, with the following exceptions:

1. Sub-section (*b*). Instead of the words "6 feet," "10 feet," and "5 feet," substitute the words "1 metre 80 centim.," "3 metres," and "1 metre 50 centim.," respectively.
2. A note is added as follows:

(Translation.)

Rules (*b*), (*c*), (*d*), and (*g*) do not apply to open boats. As regards open fishing-boats and other open boats, whether under sail or propelled by oars, in Norwegian inland waters connected with the sea, see section 28.

Section 28 is as follows:

(Translation.)

Open fishing-boats and other open boats, whether under sail or propelled by oars, in Norwegian inland waters connected with the sea, are not required to show any signal. They shall, however, show due attention, and shall take every precaution to prevent a collision.

SIAM—

Open fishing-boats and other open boats shall not be required to carry the side-lights required for other vessels, but shall, if they do not carry such lights, carry a lantern having a green slide on the one side, and a red slide on the other side, and on the approach of or to other vessels such lantern shall be exhibited in sufficient time to prevent collision, so that the green light shall not be seen on the port side, nor the red light on the starboard side.

Fishing-vessels and open boats, when at anchor, or attached to their nets and stationary, shall exhibit a bright white light.

Fishing-vessels and open boats shall, however, not be prevented from using a flare-up in addition, if considered expedient.

SWEDEN—

Identical, with the following exceptions:

Sub-section (*b*.) Instead of the words "6 feet," "5 feet," and "10 feet," insert the words "1 metre 80 centim.," "1 metre 50 centim.," and "3 metres," respectively.

THE NETHERLANDS—

(Translation.)

Open boats, whether fishing-vessels or others, are not required to carry the side-lights required by sea-going ships, but if they do not carry these lights they must be provided with a lantern with a green glass on the one side, and a red glass on the other side. This lantern shall be exhibited in sufficient time to prevent collision, so that the green light shall not be seen on the port side, nor the red light on the starboard side. Fishing-vessels and open boats, when lying at anchor or attached to their nets, shall exhibit a bright white light. In addition they may, from time to time, show a flare-up light, if they think it advisable.

GREAT BRITAIN—

Article 11. A ship which is being overtaken by another shall show from her stern to such last-mentioned ship a white light or a flare-up light.

Article 12. A steam-ship shall be provided with a steam-whistle or other efficient steam-sound signals, so placed that the sound may not be intercepted by any obstructions, and with an efficient fog-horn, to be sounded by a bellows or other mechanical means. and also with an efficient bell. A sailing-ship shall be provided with a similar fog-horn and bell.

In fog, mist, or falling snow, whether by day or night, the signals described in this Article shall be used as follows, that is to say :

(*a.*) A steam-ship under way shall make with her steam-whistle or other steam-sound signal, at intervals of not more than two minutes, a prolonged blast.

(*b.*) A sailing-ship under way shall make with her fog-horn, at intervals of not more than two minutes, when on the starboard tack one blast, when on the port tack two blasts in succession, and when with the wind abaft the beam three blasts in succession.

(*c.*) A steam-ship and a sailing-ship when not under way shall, at intervals of not more than two minutes, ring the bell.

Article 15. If two ships under steam are meeting end on, or nearly end on, so as to involve risk of collision, each shall alter her course to starboard, so that each may pass on the port side of the other. This Article only applies to cases where ships are meeting end on, or nearly end on, in such a manner as to involve risk of collision, and does not apply to two ships which must, if both keep on their respective courses, pass clear of each other. The only cases to which it does apply are when each of the two ships is end on, or nearly end on, to the other; in other words, to cases in which by day each ship sees the masts of the other in a line, or nearly in a line, with her own, and by night to cases in which each ship is in such a position as to see both the side-lights of the other. It does not apply by day to cases in which a ship sees another ahead crossing her own course, or by night to cases where the red light of one ship is opposed to the red light of the other, or where the green light of one ship is opposed to the green light of the other, or where a red light without a green light, or a green light without a red light, is seen ahead, or where both green and red lights are seen anywhere but ahead.

Note.—In the case of Mexico and Siam the Rules furnished to the Conference are dated prior to 1884, and it is not known whether these countries have adopted the changes introduced in 1884, and subsequently, into the Rules of other countries. It has, therefore, not always been possible, in the case of Mexico and Siam, to apply the same method of comparison with the Rules of Great Britain as has been applied with regard to other countries.

---

* Some Powers have not considered this Article, which provides signals for ships in distress, as proper to be inserted in Regulations for preventing collisions at sea, and have therefore omitted it.

Inclosure 4 in No. 139.

Report of the Committee on Lights.

[Accompanied by three Plates and an Appendix.]

Sir, *Washington, November* 4, 1889.

THE Committee on Lights, pursuant to the Resolution adopted by the Marine Conference on the 17th ultimo, instructing the said Committee to examine and report on the literature on lights in possession of this Conference, have agreed upon a Report, which they have the honour to respectfully submit.

The literature submitted to the consideration of the Conference consists of papers, most of which offer certain distinct proposals. All these bear witness of the great interest the work of the Conference has excited, and a number of them show evident marks of the deep thought and great ingenuity brought to bear on the subject by the authors. Nevertheless, the Committee have not thought it advisable to single out any special system for adoption, but content themselves with reporting, in general terms, upon such as are typical of their class. The Committee, however, take this opportunity to express their sense of appreciation of the interest taken in the work, the sincerity of effort, and the ingenuity of which nearly every proposal bears evidence.

Before entering into a more detailed discussion of the proposals submitted to the Conference regarding lights, the Committee feel it their duty to say that it is absolutely necessary to be as conservative in regard to the existing Rules concerning lights as possible. It has to be borne in mind that these Rules, after being nearly 40 years in force, have become as familiar to every seaman as if they were cast in iron letters and so impressed on their minds. Every change, therefore, has to be considered most seriously before its adoption, and this should be done only when considered absolutely necessary. Otherwise, such an adoption may lead to confusion, and this, probably, would beget serious danger to life and property at sea, for the better protection of which this Conference is assembled.

Bearing this in mind, the Committee beg leave to state that, although they have no direct evidence of the insufficiency of the present system of lights, they nevertheless are of the opinion that the Regulations actually in force are insufficient to make the presence of a sailing-vessel known to a fast steamer approaching her soon enough to give the latter ample time to keep out of the way.

For, if a steam-vessel has to keep out of the way of a sailing-vessel, then it is clearly the duty of the latter to make her presence known soon enough to make it possible for the steam-vessel to comply with the Regulations.

In this respect the side-lights at present shown by sailing-vessels (Articles 6 and 7) and the white or the flare-up lights exhibited astern (Article 11) are not satisfactory. It is considered, therefore, desirable that some plan be found by which the presence of a sailing-vessel should be indicated at a greater distance than under the present Regulations.

The proposals which have been submitted to the consideration of this Committee aim to supply this want:—

(*A.*) By introducing a white light to be carried a considerable distance above the side-lights and to be visible at a greater distance than these, say 4 or 5 miles.

(*B.*) By increasing the power of the side-lights.

Both these systems would increase the cost of fitting out vessels—a matter worth consideration.

(*A.*) The introduction of a white light, such is as carried by steamers under way, according to the present Rules, would, in the opinion of the Committee, indicate the whereabouts of a sailing-vessel in a simple and efficient way, and at such a distance that even the fastest steamers would have ample time for manœuvring in order to keep clear.

But the white light on sailing-vessels would complicate the system of carrying lights on all classes of ships, since it would, as a matter of course, necessitate an increased number of lights to be carried by steamers also.

The adoption of such a light would moreover give to a sailing-vessel in the future the same system of lights carried at present by a steam-vessel. This would bring about a radical change in the Regulations, which should, if possible, be avoided.

The Committee is fully aware also of the difficulty of placing a white light on board of a sailing-vessel in such a manner as never to be obscured by the sails, particularly the head-sails.

There seem to be but the following places in which these lights might be carried:—

1. On the end of the bowsprit.
2. Under the foretop.

3. Under the foretopmast cross-trees.

4. At the truck of a mast.

But none of these positions can be especially recommended to the consideration of the Conference.

(*B.*) It appears very difficult, if at all possible, to increase the power of a ship's side-light from the present range of 2 miles to that of 3, as proposed, without at the same time increasing the size of the lantern in a manner which would make it too cumbersome and expensive for use on board ship, where the conditions are such as to make the construction of lanterns particularly difficult. The range of a light increases only in the ratio of the square root of its power, and it would be necessary to increase the latter in the ratio of 4 to 9 or 1 to 2·25 in order to get the desired range mentioned above.

The Committee had no exact data before them on which they could safely base a more detailed investigation of this important and difficult question, and they therefore took the liberty to suggest that a number of experiments be carried out by the Lighthouse Board of the United States in order to furnish the material necessary for further discussion.

Probably the construction of a more powerful light would necessitate the use of a wick of much larger diameter than that used at present, if not of a second wick, and this addition would again make it much more difficult to screen the lights properly. An electric light, on account of its smaller diameter, could no doubt be more easily arranged in such a manner as to meet the difficulty, but, in the opinion of the Committee, such a light cannot be made compulsory at the present day.

The Committee, therefore, come to the conclusion that though they cannot but consider an increase in the power of the side-lights most desirable, they do not find themselves at the present moment in a position to recommend any means by the adoption of which the desired end could with certainty be obtained. This, however, may, as they hope, result from the experiments now undertaken by the Lighthouse Board of the United States.

Résumé.—The Committee, while fully aware of the great desirability of making the presence of a sailing-vessel known at a greater distance than at present, are unable to recommend any of the systems submitted to their consideration as being free from all reasonable objections.

Much of the uncertainty at present felt on this account could, however, be avoided were the Regulations properly enforced. And since among the papers submitted there are many complaints of the absence of proper lights on board sailing-vessels, they believe that the attention of the different Governments should be called to the necessity of better enforcing the Regulations in the future.

Means proposed to better indicate the Course of a Ship.

Among other proposals submitted to the Conference, those which aim at a better indication of the direction of a ship's keel are the most important. They may be classed as follows:—

(*A.*) Those in which range-lights are made use of, *i.e.*, lights placed at a considerable horizontal distance from each other, and placed in the same vertical plane with the keel.

(*B.*) Those in which two or more side-lights are used on the same side of the ship.

(*C.*) Those in which it is proposed to give to the side-lights a certain relative position in regard to the white mast-head light of a steam-vessel.

(A.)—*Systems in which Range-Lights are made use of.*

Range-lights were proposed a long time ago. They have been in use on board vessels navigating the inland waters of the United States of America for a considerable period, and have been made compulsory for such vessels by the Rules approved by the Secretary of the Treasury, Circular No. 14, of March 1, 1883, Rule 7.

The claim of originality for any of the systems submitted to the Conference can for this reason be entertained only in so far as the original system has been changed in one way or the other.

A list of the systems proposed will be found in Appendix (A).

The Committee regret that they could not report on other proposals regarding such lights, which have been made in different countries during a considerable number of years, and they beg to state that in their opinion a number of these are not inferior to many of the systems under discussion.

The system proposed by Lieutenant F. F. Fletcher, United States' Navy, has been explained to the Committee by Commander Chadwick, United States' Navy, whose "Report on Trials on Running-Lights and Sound-Signals," by the United States' war-vessels "Yorktown," "Despatch," and "Triana," has been officially brought to the notice of the Conference. This Report speaks favourably of that system, and the Committee have selected it, therefore, as a representative one of this class, and one well suited to be commented upon.

This has been done in order to be able to discuss the important question before us more in detail than would have been possible if only general principles were discussed.

The Committee beg to state that the comments made regarding this system may be applied to nearly all other systems proposed, bearing in mind, however, that changes in particulars may influence the result to which we have come, but only in an unimportant degree.

The light system of Lieutenant Fletcher consists in making use of a range of three lights, which have been placed as follows:—

Forward of the foremast, at a distance apart not less than the beam of the ship, two bright white range-lights of the same character as the present masthead-light, visible from ahead to two points abaft the beam on either side. These lights shall be in the vertical plane of the keel, with the lower one so placed forward of the upper one that an imaginary line through them will make an angle of 55 degrees with the vertical. The third light is placed near the stern on the taffrail, and screened so as to throw a light from right astern to two points forward of the beam.

When right ahead of a steam-ship an imaginary line through her two range-lights will appear vertical if the ship be on an even keel.

On the starboard bow of a steam-ship an imaginary line through her two range-lights will appear inclined from the vertical to the right, and on the port bow to the left from the vertical.

When more than four points on the bow of a steam-ship her range-lights will appear inclined more than 45 degrees, and at six points her stern-light is visible.

If we imagine that an observer is stationed at a great distance, and a ship, lighted in the proposed manner, turned around the perpendicular through her middle range-light, then it will be seen that the horizontal distance between the masthead-light and the forward range-light does not increase in the same ratio as the angle between the visual line of the observer and the keel of the ship, but only in the ratio of the sines of this angle. (See Fig. 1, in which the distance of the observer is assumed to be indefinite, and, in consequence, the visual lines parallel to each other.)

By a glance at the accompanying diagram (Fig. 1) it is easily seen that the lights at an angle of six points appear at the same distance as at angle of ten points. The same is true with regard to the angles of seven and nine points, and others which may be symmetrically placed to the line, Ll_8, up to two points of this line.

The horizontal distance at which the two forward range-lights at different angles appear has been calculated, and will be found in the column (*b*) of the following Table for a perpendicular distance between the lights of 21·2 feet, which makes the horizontal distance between the lights for an angle 55 degrees = 30 feet.

(*a*.) If the angle of keel of ship and visual line of observer is—	(*b*.) Then the horizontal distance between two forward range-lights will be—	(*c*.) If $\frac{21 \cdot 2}{4}$ be a unit, and it is assumed that each unit corresponds with one point, then for other points the distance is—	(*d*.) Difference between columns (*b*) and (*c*).
Points.	Feet.		
1	5·9	5·3	— 0·6
2	11·5	10·6	— 0·9
3	16·7	15·9	— 0·8
4	21·2	21·2	+ or — 0·0
5	24·9	..	..
6	27·7	..	..
7	29·4	..	..
8	30·0	..	..
9	29·4	..	..
10	27·7	..	..

We see from column (*b*) that the horizontal distance under which the two range-lights are seen, after the ship has turned four points, has become 21·2 feet, and at this point is equal to the perpendicular distance between the lights; the triangle formed by the horizontal line through the forward range-light, the perpendicular through the foremast-head-light, and the line connecting the lights, has become equilateral, both angles at the connecting line. (Ll_4, Fig. 2, being 45°.)

Now, order a look-out to watch carefully, and give him the following instructions: That when he sees the two white lights, one below the other, the ship which shows them is heading directly for him; that if a plumb line from the masthead-light appears to be separated from the forward light one-quarter of that distance, her course makes an angle of two points; and that if the distance is equal to three-quarters, or equal to the whole of the perpendicular, then that ship's course will be three or four points inclined to his eye-line.

Such instruction may be understood by a sailor and may not. But if he should understand it and is accustomed to judge distances somewhat correctly, he will be able to determine the other ship's course pretty accurately, for, as column (*d*) shows, there is only a small difference between the columns (*b*) and (*c*), and it appears probable that, as Commander Chadwick found to be the case during the trials he made, an ordinary sailor may very well judge by this method whether a ship's course is inclined to his eye-line one, two, three, or four points, without probably making a greater mistake than half a point. (See Report, p. 7, para. 4.)

In Sector B, Fig. 3 (that is, from four to six points), it would become more difficult to judge the course correctly; because here the horizontal alteration of distances between the lights becomes much smaller for the same alteration of the course of the ship, but the error will probably not become more than one point. At six points the after range-light would come in view, but it will probably not be possible to estimate the bearing in the sector (C) more closely than to say that an observer is "abeam" of the other vessel. Errors up to two points may on this account be expected.

Further aft than ten points from right ahead, both the forward range-lights, as well as the side-lights, will be shut in, and by the stern-light alone it will only be possible to say that an observer is within six points on either quarter.

The advantages of Lieutenant Fletcher's system of range-lights, and all others similar to this, consist, therefore, in that it affords the means by which the course of a ship can be found by simple observation and comparison alone by an observer stationed in a sector from right ahead to six points on either side (sectors A and B, Fig. 3) with tolerable accuracy, say within one point, provided, however, that the ship observed has no perceptible heel.

If this should be the case, then the indication of the course will become less correct, and be changed in a ratio of about three-quarters of the amount of heel. This will be seen by reference to Fig. 4, in which S is the ship seen by an observer stationed right ahead; L and *l* the two range-lights, and *a* the angle of heel. The two lights appear not in a vertical line, one below the other, but inclined, and the lower light to the right of the perpendicular through L, at a distance $ll_x = Ll \sin a$.

If we assume, as before, $Ll = 21{\cdot}2$ feet, and $a = 12°$, then llx is $= 4{\cdot}4$ feet; if we compare this with the Table, column (*b*), we find that this would correspond to a change of course of about $\frac{3}{4}$ of a point (more exactly 8·5°), and that the observations of the ship's lanterns lead in this case to an error of this amount, whereas if the ship had been on an even keel, the indication of the ship's course would have been more correct in this position than in any other.

True, in the present case, the side-lights would have been visible, and could have been used to correct this error.

But this could not have been done if the ship's head had been turned from one to two points, where the error would have been about the same.

From the foregoing, it follows that the use of range-lights on the high seas does not offer the same advantages as have been found to be derived from it by vessels navigating inland waters, and this should not be lost sight of in coming to a conclusion regarding the introduction of such a system.

A practical difficulty will also be found in the placing of the forward range-light according to the demands of this system. For if a ship's foremast is placed 60 feet from the bow, and the foremasthead-light at a height of 30 feet above the hull, the forward range-light, with a minimum vertical distance of 15 feet, would be placed 15 feet above the hull and 34 from the bow; that is in a place where it is presumably difficult to keep it, if a fast steam-ship is going at full speed against a head sea.

If such a ship be provided with a turtle deck, it would probably be difficult to hoist or lower the lantern without slackening the speed, and to control the burning of the light.

It has also to be kept in view that a white light, accidentally shown somewhere about the stern, for instance, a bright binnacle light, could be mistaken for the stern-light, and thus lead to the belief that the observer is abeam of a vessel, when he is actually in a sector within six points from ahead.

It has to be remembered, too, that what a seaman especially wants to find out, when he watches another ship, is whether she is proceeding in such a manner as to involve risk of collision.

But the knowledge of the course of the ship alone is not sufficient to determine this. It would remain necessary to watch the compass-bearing of the ship in sight whether she be fitted with range-lights or not.

The greatest advantage of the above system, in the opinion of the Committee, is that a small change in the course of a steamer approaching end on, or nearly so, is at once and unmistakably indicated.

Lieutenant Fletcher also proposes that the foremast-light be occulted every half-minute for steamers going at a greater speed than 13 knots.

This proposition cannot be recommended by the Committee, as the construction of such a lantern is too complicated. It would, moreover, give only a very approximate idea of the speed of steam-ships, as these are known to proceed at the present day at any speed up to 20 knots and more.

Conclusion.—Range-lights, if properly placed and fitted, indicate, under certain circumstances, a ship's course in a more accurate way than at present. This is of some advantage, and therefore, in the opinion of the Committee, the optional introduction of some such system may be proposed for the favourable consideration of the Conference, adding, however, that no definite system should be decided upon for adoption before this subject has been more fully studied, and before a larger number of experiments under different circumstances have been carried out.

(B.)—*Systems in which two or more Side-Lights are employed on the same side.*

There are certain general objections to the introduction of a system which, in some cases, would require double the number of lanterns carried at present, and more, and it is considered advisable to state these before going into further particulars.

1. It has been found very difficult to compel certain classes of ships to carry the lights prescribed for them by the Regulations actually in force. It has to be expected that, had they to carry double the number of lanterns, there would result, presumably, still more cases of non-compliance with the law.

2. The care of a larger number of lanterns would require more men than could be spared for such service on board of small vessels.

3. The cost of the outfit of every vessel and the cost of providing the illuminant would be considerably increased. This would probably not affect the owners of large steam-ships, but would not be easily be borne by the man who owns only a portion of a small sailing-vessel.

Of the proposals submitted, a number were so definite that diagrams showing the number and arrangement of lights proposed could be drawn (see Figs. 5 to 12).

In these, A is to be the sector in which two coloured side-lights are visible; B the sector in which one coloured side-light; C the sector in which only the white stern-h (Article 11) or a white side-light (Fig. 12) is visible.

It will be seen, by reference to the figures, that an observer has only to count the number of side-lights visible from his position in order to know in which of the sectors A, B, or C he is. It is evident, then, that the course of a vessel, by the adoption of any one of the proposals submitted, could only be ascertained very approximately, and this advantage does not seem to the Committee important enough to warrant the recommendation of any of the proposals submitted to the favourable consideration of the Conference.

It is true that, by placing the lights on each side at a certain defined distance from each other, it would be possible to estimate the course of a vessel more approximately than at present, at least, when two lights are seen.

Practically, it would be most difficult to comply with such a proposition, and it, therefore, cannot be recommended. In addition to this, it ought to be stated that, as far

as known to the Committee, only a few experiments have been made with systems employing double side-lights at sea. The Royal Spanish Navy has tried it already in a squadron, and has found that the advantages gained by side-lights were not so great as to recommend their adoption. Neither have they given satisfaction to the officer in charge of the trials made in the United States (Report on Trials quoted above, p. 7, para. 4), and some of the advantages claimed for these systems remain to be proved before they can be considered as having more than theoretical value.

(C.)—*Systems in which the Direction of a Steam-Vessel is shown by placing the Side-Lights in a certain position relative to the Masthead-Light.*

It is evident that if the side-lights of all steam-vessels were so placed that a vertical plane through the line drawn from them to the masthead-light would form a certain known angle with the keel, it would be possible to estimate the direction in which a ship is heading more approximately than at present.

If, for instance, a ship had her lights so placed that the vertical plane through the line connecting the foremasthead-light with the side-lights would form an angle of 45° with the keel, counting from right ahead, then an observer on the starboard side of such a vessel would know that if the lights were visible one below the other that the course of the ship he sees was inclined four points to his eye-line; that if he saw the green light to the left of the foremast-light he would be in the sector between this line and the bow, and if he saw the green light to the right of the foremast-light, that then he would be in the sector aft of the four points line.

By noticing whether the horizontal distance between the two lights was larger or smaller, he would get another indication, and an observer would, therefore, be able to judge the course of a ship sighted pretty closely—say, within one or two points.

Unfortunately it is, in the Committee's opinion, practically impossible to assign to the side-lights a certain fixed position in regard to the foremast-light, particularly if this position should be chosen forward of the mast, by which, no doubt, the greatest advantage could be gained. But we think that at least some advantage migh be gained by placing the side-lights abaft the mast, at as nearly a certain fixed angle as circumstances will permit. Such a change could be made, probably, without incurring great expense, and we wish to propose to the Conference the adoption of a Rule according to which steamers would have to carry their side-lights abaft the foremast-light, the connecting line forming an angle of six points with the keel, or as nearly so as possible.

Besides these proposals there were a number of other propositions to better indicate a ship's course, submitted to the consideration of the Conference, which, though they may possess considerable merit, could not be commented upon according to the Resolution of the Conference, under date of the 21st October, by which it was resolved that no change should be made in the use of the present masthead-light and coloured side-lights. On that account proposals that made use of multi-coloured masthead lights, white side-lights, &c., could not be considered.

Stern-Lights.

Amongst the literature placed before us there are some papers proposing a stern-light fixed near the stern on the taffrail or thereabout. Such an arrangement would possess some advantages and would make it less necessary to look out astern for overtaking ships in order to show them the white light required by Article 11.

It would be impossible for small vessels to carry it in this position in bad weather, and therefore it cannot be recommended that a white light, fixed at the stern, be made compulsory for all vessels, large and small, but there seems to be nothing in the way of permitting all vessels to show a white light from the stern permanently.

In the case that the Conference should adopt this proposition, it would be well to have such lights screened so as to be visible at a certain angle only. This, under certain circumstances, would serve as an additional means to determine the course of a ship.

The Committee do not believe that any bad result would come from having the stern-light and side-light visible at the same time, as they would, under the circumstances, not be seen except at a considerable distance apart, and we therefore recommend that if such lights should be permitted, they be fixed so as to be visible from astern to abeam on either side.

Two Lights as Anchor-Lights.

There is a proposition before the Committee by which it is prescribed that two anchor lights—one at the bow, one at the stern—should be made compulsory for large steam-vessels. In such vessels it is impossible to place a white light in such a manner as to be visible all around the horizon (Article 8) on account of the funnels. It is, therefore, in the opinion of the Committee, advisable to make a second white anchor-light compulsory for all large steam-vessels. Perhaps it would be well to draw the line in such a manner that all steam-vessels which, as a class, have funnels higher than 20 feet above the hull—this being the maximum height at which anchor-lights can be carried (Article 8)—should have to carry two lanterns.

Among the suggestions submitted to the Conference there are a number which are not definite enough to be commented upon, but which have suggested some Resolutions, which are appended, and are herewith submitted to the Conference.

1. That in the opinion of the Committee the power of all running and anchor-lights should be expressed by referring them all to one standard by which the light issuing from the lantern should be measured.

2. That the minimum power only of each such light should be definitely fixed, leaving it to the judgment of the parties responsible for fitting out the ship with proper lanterns to employ lamps of this or of higher power.

3. That the use of electric incandescent lamps is to be permitted; that the use of the arc light, however, is to be, at least for the present, excluded for all purposes other than signalling and search lights.

4. That each lantern must be so constructed that the minimum power of light is to be found at every point where the light is to be visible, after the lamp has been fitted with proper screens.

5. That the lanterns shall be so constructed as to insure the light having at least the required minimum power in the ideal line connecting the lantern with the horizon, even though the ship be heeled one way or the other 12 degrees.

6. That the colour of the glasses by which the colouring of the light is to be produced be so chosen that the lights retain their distinctive colour even in a fog.

7. That no detailed description should be internationally adopted for the construction of the lamp or lantern, so that a fair chance be given inventors to produce serviceable articles.

President of the International Marine Conference, &c.

Appendix (A).

	Names of Persons having proposed distinct Systems of Range Lights or Names of Systems.	Short Indication of Measures proposed.
1	M. A. Hautreux, Lieutenant de Vaisseau, and M. Lanneluc, Capitaine au Long Cours.	All sailing- and steam-vessels to carry a white light at the foremast and side-lights. The steam-vessels to show, besides these, a white light in front of masthead-light. The line connecting these two to be 45 degrees with the vertical. All lights for steam-ships to be electric. The foremast-light to be scintillating for steam-ships of over 12 knots speed.
2	F. F. Fletcher, Lieutenant, United States' Navy.	Forward of the foremast, at a distance apart not less than the beam of the ship, two bright white range-lights of the same character as the present masthead-light, visible from ahead to two points abaft each beam. These lights shall be in the vertical plane of the keel, with the lower one so placed forward of the upper one that an imaginary line through them will make an angle of 55 degrees with the vertical.
3	Modified Fletcher System ...	Forward range-lights as in system No. 2; a white light to show all round the horizon, and at the same height as the forward upper range-light, to be placed as far aft as possible, in lieu of the light at stern.
4	United States' Inland Range System.	With present system of masthead-light and side-lights an after range-light is employed, visible around the horizon, and placed at twice the height of the forward masthead-light if possible.
5	M. L. Wood, Lieutenant, United States' Navy.	Side-lights, as at present used, both for sailing- and steam-vessels: (1) a white top-light under the foretop; (2) a white peak-light, visible all around the horizon on a monkey gaff. In addition to these, steamers have to carry a red top-light 3 feet below the white top-light, and a white bow-light with a reflector, in a funnel-shaped screen box, visible from the bow four points on either side.
6	John M. Hudson, Captain of the ship "Red, White, Blue."	All steam-vessels to be fitted with masthead-light and side-lights, as at present, and to carry a central range of two white lights besides; the stern-light to be placed near the flagstaff aft, the front light to be placed not more than 80 or 100 feet in front of this.
7	George P. Blow, Ensign, United States' Navy.	Sailing-vessels and steam-vessels to be fitted with two range-lights; the front light to show green on the starboard and red on the port side, visible from right ahead to two points abaft the beam on either side; the after light to be a light or combination of two lights, visible all around the horizon, proposed to denote the speed of steamers and the rig of sailing-vessels. No side-light and no stern-light to be used with this system.

Additional Report of the Committee on Lights.

Sir, *Washington, D.C., December* 12, 1889.

IN accordance with the Resolution passed by the Conference on the 9th instant, your Committee have again considered the question whether it would be advisable to assign a certain position to the side-lights, as has been done by extra amendment No. 41 to Article 3, which has led to the Rule adopted by the Conference, viz.:—

"The said green and red side-lights to be placed in steam-vessels not forward of the masthead-light, and in sailing-vessels as near abreast the foremast as practicable."

Doubts have been raised by the Collocation Committee on the advisability of this Rule, on the ground that it involves a radical change and leads to great expense by compelling a very material alteration of the present construction of many ships, consequences which are said to outweigh the slight advantage of the introduction of the Rule in question.

Your Committee, after having most carefully considered the subject, are unanimous in reporting that, in their opinion, the Rule passed by the Conference ought to be maintained.

In the Report dated the 4th November, 1889, the reasons have been given why in principle it would be advisable to have the side-lights of all steam-vessels so placed that a vertical plane through the line drawn from them to the masthead-light would form a certain known angle with the keel. It has at the same time been acknowledged to be practically impossible to give the side-lights a certain fixed position in regard to the foremast-light, but it has been thought practicable, and, therefore, has been recommended, to introduce a Rule by which steamers are compelled to carry the side-lights abaft the foremast-light, the connecting line forming an angle of six points with the keel, or as nearly so as possible.

The considerations which have led to this recommendation appear to your Committee to be sound, and whilst confirming what has been said in the former Report, we beg to add the following remarks.

The Rule as adopted by the Conference does not, it is true, go quite so far in assigning to the side-lights a certain fixed position with regard to the masthead-light as the recommendation contained in our Report of the 4th November. Nevertheless, by preventing steam-vessels from carrying the side-lights forward of the masthead-light, it will serve to give more certainty to the respective position of the regulation lights, and thus, in our opinion, will mark a decided improvement of the means of ascertaining the course of an approaching steamer, which improvement will gradually be increased when experience shows the advantages of the system.

On the other hand, the difficulties connected with the introduction of the Rule appear to be not at all unsurmountable. Many ships are even now constructed so as not to require any changes in consequence of the adoption of this Rule. Others might easily comply with the Rule by changing the position of the masthead-light in placing it more forward of the foremast. And even if the position of the side-lights should have to be altered, this could, in most cases, be done without incurring too heavy expense.

We, therefore, recommend to let the Rule stand as it is, provided, however, that the Rule be adopted universally. Having regard to the difficulties which some ship-owners may justly feel if they had to comply with the new Rule at once, your Committee think that sufficient time should be allowed for the effecting of the changes necessitated by the Rule, so as to enable ship-owners to carry out these changes under the most convenient conditions. Vessels now in course of construction will, of course, be able to adopt the new principle at once.

As regards sailing-vessels, the Committee do not consider it necessary to adopt the above-mentioned Rule.

We have, &c.

President of the International Marine Conference, &c.

Inclosure 5 in No. 143.

Report of the Committee on Sound-Signals, appointed by the International Marine Conference to examine and report to the Conference the Literature on that Subject which is in the possession of the Conference.

Washington, October 31, 1889.

SINCE our first meeting, on the 23rd instant, we have examined the numerous proposals that have been placed before the Conference, and submitted to us, for indicating in fog, mist, or falling snow the direction in which a vessel is proceeding by means of sound-signals, in agreement with the course steered; the sounds or characters being made by one or more steam-whistles or fog-horns, and varying in number, length of note, or pitch of tone, to distinguish the course of a vessel.

We have also had before us a Memorandum prepared by the Committee of the Second Northern Maritime Conference, held at Copenhagen, dated 1888. It is there stated that "The sound-signals in fog, mist, or falling snow, according to Article 12, are commonly regarded as insufficient, as hereby only is prescribed 'that a steam-ship under way shall make with her steam-whistle, or other steam sound-signal, at intervals of not more than two minutes, a prolonged blast,' as by this means only the very incomplete information is obtained that a steamer is within the range of hearing. Proposals to the remedy hereof exist in a considerable number, partly as to sound-signals indicating alterations of a ship's course, and partly as to indicating the courses of a ship. Fog sound-signals for manœuvring seem to have gained only a few adherents, as they generally are considered to be more misleading than leading in crowded fairways. On the contrary, a steam-whistle system for 'Compass Course-Signals' is commonly considered as practical and useful.

"The objections to a compass course-signal system seem to be derived from a fear, partly that such combined signals might easily be misunderstood, and thereby do more harm than good, and partly on account of the difficulty of deciding with certainty the exact direction in which the signals are heard. Nevertheless, as far as we can judge, it seems that if the 'whistling' which now only signifies 'here is a steamer' was arranged in such a manner that it did signify 'here is a steamer steering a certain course,' that this could not make the situation worse, but rather serve to better it. Adherents or not adherents to such a system do, however, agree that neither the steam-whistle nor the fog-horn are, as a rule, of sufficient efficiency, and that this matter, therefore, ought to be regulated by International Agreements."

We have also considered (1) the replies to a Circular sent out by the United States' Hydrographic Office to the branch offices, asking for the opinion of practical men on the subjects referred to in the programme of the Conference, an epitome of which replies, so far as they relate to the subjects on which we are to report, we have prepared and have annexed (Appendix A); (2) the opinions expressed, in reply to a Circular letter sent out by Captain Shackford, by a number of experienced seamen employed in navigating vessels in American waters and in the Atlantic, the majority of whom express themselves against the introduction of course-indicating sound-signals; and (3) a Memorandum (Appendix B) on the use of such signals, prepared lately by the British Board of Trade, which discusses the whole subject, and contains the opinion of the most experienced British ship-masters, a very large proportion of whom are against the introduction of such signals.

We have further considered certain proposals for the introduction of a general system of sound-signals for use in all weathers; for the adoption of a few sound-signals of an urgent or specially important nature; and for the adoption of sound-signals to denote any movement of helm.

The present authorized compulsory signals made by a moving vessel at sea, in fog, mist, or falling snow, are a prolonged blast on the steam-whistle of a steam-ship, or one, two, or three blasts on the fog-horn of a sailing-vessel.

We are informed and believe that the custom of careful seamen, when navigating steam-ships in fog by means of these signals, coupled with the injunction to proceed at a moderate speed under Article 13 of the International Regulations, is immediately the fog-signal of another ship not in sight is heard, apparently approaching from any direction before the beam—to reduce speed in agreement with the density of the atmosphere, and if necessary to stop and remain stopped until the other ship is located with as much accuracy as possible, then to proceed cautiously until all danger of collision has ceased to exist.

The principal difficulty in making use of a practical system of sound-signalling in foggy weather is in taking in the signal correctly, not in making it.

Until seamen are able to localize a sound with as great precision as they can the position of a light or object seen visually, the results to the mercantile marine from the adoption of a system of course-indicating fog-signals are in the opinion of the Committee a doubtful advantage. The chief use would appear to be to give facilities to approaching vessels, when not in sight of one another, and therefore when not certain of one another's position, to continue their respective courses without having first localized the direction and distance off of the neighbouring ship, and for the two vessels to try to pass close to each other without taking the precaution of first reducing or, if necessary, stopping their way through the water.

It is for the Conference to decide on the vital question whether to permit the use of such signals in the mercantile marine or not. But the Committee submit that increased danger might probably result—owing to the inability of the large majority of men to localize sound with sufficient accuracy—if those in charge of steam-ships are encouraged to navigate their vessels past others not in sight in a less cautious manner than they do at present.

The Committee are of opinion that, however simple an adopted system of course-indicating sound-signals may be, and however distinct in character the symbols chosen are from the signals now authorized and used, if vessels were navigated in dependence on them, when neither can see the other, there would be a danger of the officer in charge reading the signal incorrectly, or, if read correctly, of interpreting it wrongly.

Further, if such signals were in use in crowded waters, we apprehend that danger would result from the uncertainty and confusion produced by the multiplicity of signals, and from a feeling of false security that would be created in the minds of many.

The Committee would invite the consideration of the Conference to the following points:—

1. We are of opinion that many of the steam-whistles and the fog-horns and bells now in general use cannot be heard a sufficient distance; we therefore recommend the use of instruments giving a louder sound; and we consider it desirable that the sounds given by steam-whistles and fog-horns should be regulated so that the tones of the steamer's fog-whistle should be as distinct as possible from the sound of the sailing-vessel's fog-horn.

2. As a vessel at anchor in a fog, &c., in a fairway at sea, is in a more dangerous position, particularly while swinging round broadside to the main line of route with a change of tide, than if under way and sounding the authorized fog-horn, we would suggest that such a vessel should be compelled to use a more efficient sound-signal than the bell at present authorized.

3. As in a fog, &c., a tug towing another vessel forms an exceptional danger, we would suggest that the tug and the one or more vessels towed should be compelled to sound a special fog-signal.

4. We would suggest that a vessel "not under command" should be compelled to sound a special fog-signal.

5. We invite attention to the desirability of not fixing the duration of the steam-ship's prolonged blast warning signal, under Article 12 of the Regulations, at any minimum until exhaustive experiments have shown that the efficiency of the signal is not reduced thereby. On this subject we attach some remarks on experiments made by M. Lefébre in Holland (Appendix C).

6. As regards the adoption of a general system of sound-signals, we learn, by a Return prepared by the British Board of Trade (copy of which is attached, Appendix D), that the majority of ship-owners and master-mariners are of opinion that there is at present no demand or necessity for such a system in the mercantile marine. Apart from the question as to war necessities, we concur in this opinion. But we would recommend the Conference to consider the desirability of introducing a few urgent and important sound-signals, particularly one to denote that, when two neighbouring ships are stopped in a thick fog, one vessel making the signal will remain stopped while the other is carefully feeling her way past her.

7. As regards helm-signals by sound, we are of opinion that it is not desirable to alter the present universally adopted signals.

8. We consider it worthy the attention of the Conference whether the custom followed at present by careful seamen of slowing or stopping on hearing the fog-signal of another ship not in sight, unless certain of her bearing and distance off, could be made compulsory, by a Regulation so worded as not to relieve those in charge from full responsibility.

9. As a relatively important matter, we would direct the attention of the Conference

to the desirability of steam-ships being provided with the means of blowing off the surplus steam when the engines are stopped in such a manner as to occasion as little noise as possible.

(Signed) SPAUN, *Delegate of the Austro-Hungarian Government.*

VAN STEYN, *Delegate from the Netherlands.*
J. W. SHACKFORD, *Delegate of the United States.*

To the President,
International Marine Conference.

Appendix (A) to Report of Committee on Sound-Signals.

Circular to Branch Hydrographic Offices.

Hydrographic Office, Navy Department, Washington, D.C.,
Sir, *May* 3, 1889.

A COPY of the programme of subjects to be considered by the International Marine Conference has been forwarded to you to-day. It is the desire of the Chief of the Bureau of Navigation for you to discuss this matter thoroughly with all those who are interested and competent to judge, and to make a Report in detail to this Office. The object of this is to formulate practical views for the use of our Commissioners, on all or any of the subjects referred to, or on any others that may have been omitted. This matter must be taken up at once, although sufficient time will be allowed to do the subject that justice which its magnitude and importance demand.

Attention is called to the April number of the "North American Review," containing articles bearing on this subject.

Very respectfully,
(Signed) G. L. DYER, *Hydrographer.*

Answers to Circular of United States' Hydrographic Office from various Writers.

SUMMARY OF OPINIONS AS TO FOG-SIGNALS, &c.

Branch Hydrographic Office, New York, August 13.

Doubt as to what quality of whistle is most audible, also as to course-indicating signals; it would seem that, as they are simpler than bugles, sailors could learn former as easily as cavalry-horses learn latter.

Suggests speed to be limited to 6 knots an hour.

Experiments should be made as to penetrating power of signals, and a code of compass-signals made. Incloses codes of manœuvring signals and compass-course signals.

Branch Hydrographic Office, Norfolk, Virginia.

Fog-signals should not imply how the vessel is heading as regards the wind.

All vessels should slow in a fog; speed not to exceed 5 or 6 knots an hour.

Helm-signals should be made in clear and foggy weather. Systems adopted should be simple and international, and enforced by law.

Branch Hydrographic Office, Boston, Massachusetts, September 19.

Fog-signals.—No complication whatever should be attempted. Many authorities in favour of course-signals—not more than eight points of compass. Advise Morse system, also signals for vessels towing, not under command, anchoring. Helm-signals, especially during foggy weather, are unnecessary complications, at least in open sea; necessary in narrow inland waters. Should be uniform for all nations.

Regulation for moderate speed in fog should be amended to slow speed, *i.e.*, not more than half-speed.

Merchants' Exchange, San Francisco, September 30.

In favour of sound-signals. Incloses code, depending on number of sounds.

Branch Hydrographic Office, Baltimore, Maryland, September 26.

Any code of course sound-signals should be of simplest kind, have few elements, and only attempt to indicate four compass-points. Helm-signals should be compulsory. Speed in fog should be lowest speed at which vessel readily answers helm.

W. R. Mayo to Secretary, Chamber of Commerce.

Has seen various methods proposed for indicating the direction a vessel may be heading in a fog, &c., but believes that all of them are so complicated as to be useless; and they may therefore do harm.

The present sound-signals for fog are good, and if steamers approaching each other in a fog would adopt the precaution of slowing down close, and feeling their way by each other, no trouble would occur. The great requisite in fog and other thick weather is not more signalling from steam-whistles but greater precaution on the part of ship-masters.

R. H. Hughes, Master, Steam-ship "Nova Scotian."

Suggests a sound-signal for vessels not under command or laying a telegraph cable. Fishing-vessels at anchor to sound an automatic whistle.

Present helm-signals should be made compulsory.

Paul Brown, Master, Steam-ship "Victor."

Suggests sound-signals for a compass direction.

Signals should be sounded by minutes. Helm-signals should be made compulsory.

Suggests a sound-signal for vessel not under command.

Opinions of various experienced Mariners and other practical men obtained by Sergeant Paul Daniels.

Course-direction signals not practicable.

Present Rules are generally satisfactory if properly carried out.

Present helm-signals should be made compulsory.

Fog-signals should be sounded every 30 seconds.

Sound-signals should be adopted to denote a vessel not under command, a vessel towing, and a vessel laying or taking up a telegraph cable.

The speed of vessels approaching the coast in thick weather should be reduced to at least half-speed, say 6 or 7 knots.

Mr. R. B. Forbes.

Proposes direction-signals for eastward- and westward-bound vessels. Thinks it undersirable to establish signals for every course steered.

Speed need not be reduced in thick weather.

D. A. Nash, personal opinion to Ensign Blow.

Proposes direction-signals for eight points.

The signals should be repeated, as one signal is often imperfectly heard.

North German Lloyd's New York Agent to Ensign Blow.

No remarks on fog-signals.

H. G. Johnson, Master, to Officer in charge of Hydrographic Office, New York.

Present Regulations are all that is necessary. The Rules are very good, and such as are in familiar use by navigators.

Steam-ship "Pennland," to Ensign Blow.

Course-signals for steam-vessels would be advantageous. Present Regulations for sailing-vessels are all that is sufficient.

Fog-signals should be sounded at least every minute.

Present helm-signals should be made compulsory.

R. H. Hughes, Master.

Present helm fog-signals should be made compulsory.

Fishing-vessels at anchor should sound an automatic whistle.

Opinions on Fog-Signals collected at Branch Hydrographic Office in New York from Captains of Steam and Sailing Vessels, and Shipping Men generally.

Captain Burn (of steam-ship "El Dorado").—Believes that the present Rules of the Road are sufficient. Thinks steamers should be fitted with very powerful whistles. Recommends steam siren with parabolic reflector. In fog, both vessels should stop on hearing signals, and feel their way past each other.

Captain Mason (steam-ship "Chalmette), Captain Wiggins (steam-ship "Excelsior), and Captain Burdick (Superintendent of American Pier).—All agree in the following opinion: That the present Rules are sufficient if enforced. The simpler they are the better.

Captain Murray (of steam-ship "Alaska").—Is satisfied with the present Rules. Not in favour of any code of course-signals. Present helm-signals should be compulsory.

Mr. Reiley (Chief Officer, steam-ship "Lampasas").—Is satisfied with present Rules.

Mr. Dennett (steam-ship "State of Texas").—Is satisfied with present Rules.

Captain Rogers (barque "Siddarthe").—Satisfied with present fog-signals.

Captain Stevens (steam-ship "Manhattan").—Is against any complicated code.

Mr. Russell (Chief Officer, steam-ship "City of Atlanta").—Rules of the Road good enough as they are.

Captain Risk (steam-ship "Comal").—Advocates uniform size, power, and position of whistles.

Captain Fearon (steam-ship "Dawpool").—Advocates uniformity in instruments to be worked by compressed air.

Aaron Vanderbilt (T. E. Ward and Co.).—Advocates single and efficient code of signals (one to four blasts); compass-course signals, uniform pattern of whistles; increased power and range.

Captain Wilkinson (steam-ship "Denholm").—Fog-horns on sailing-vessels useless. Steam-whistle should be placed as high as possible, so that sound can pass over smoke-stack, &c.

Mr. Jones (Chief Officer, "Basil").—Thinks present Rules sufficient if properly observed.

Captain Bolger (steam-ship "Neuces"), and Captain William (schooner "Stella H. Kenyon").—Satisfied with Rules if enforced.

Captain Stevenson (steam-ship "Seneca") and Captain Lewis (steam-ship "Rio Grande").—Agree wite above.

Captain Hansen (steam-ship "City of Atlanta").—Satisfied with Rules; thinks that there should be a signal-whistle to designate a vessel stopped at sea, not necessarily disabled, but drifting, and not making headway.

Mr. Millard (Chief Officer, "Truro City").—Satisfied with Rules if enforced.

Captain Homer (steam-ship "Lucy B. Miller").—Agrees with above.

Pilot Joseph Nelson (pilot-boat "Stafford").—Does not believe in any possible code of signals to determine course in fog.

Mr. T. S. Negus (Chairman, New York Board of Pilots).—Says he has seen numbers of sound-signals suggested. They are inadmissible; too complicated.

Captain Ambrose Snow (President, New York Board of Pilot Commissioners).—The best Rule for preventing collisions in fog would be to require vessels to move slowly or anchor if possible, and to come to a full stop on hearing signal.

Captain Grant (steam-ship "Pennland").—Fog-horns used by sailing-vessels useless. All steamers should have whistles of greater power. In fog, vessels should stop at once on hearing signal.

Captain Gioccoechia (steam-ship "Gaditano").—Thinks four compass-courses should be signalled. Does not think any code depending on number of blasts advisable: recommends tones; whistles should be placed both forward on forecastle and aft, and should be blown simultaneously.

Mr. John R. Hughes (Inventor of Code of Fog-signals).—Believes that some system of compass-courses is essential. Thinks helm-signals should be retained only in case two vessels are in sight. No system depending directly on number or length of blasts practicable. Each vessel should carry in fog, as high up as possible, a large metal spherical cage or bell, which could be easily seen above fog in daytime.

Captain Kennedy (formerly of steam-ship "Germanic").—Fog-horns on sailing-vessels no use. For steamers believes code of signals could be used giving eight compass-courses. Code to be simple; short and long blasts; deep and shrill whistles.

Captain G. Macarthy (pilot-boat "J. F. Soabat").—Thinks some code for compass-signals should be obligatory; it should be simple: two whistles of distinct tone, one to be blown until whistle of another vessel is heard and located. Slowing down in a fog "a mere farce."

Lieutenant Smythe (Revenue steam-ship "Washington").—Code of compass-course signals recommended; eight points.

Captain Clampett (Delaware River Pilot).—Shrill whistle can be heard twice as far as deep whistles.

Captain Moody (steam-ship "State of Georgia").—Hoarse whistle can be distinguished better than shrill.

W. C. Almy, Steamer "Old Point Comfort," to Branch Hydrographic Office, Virginia.

Advocates four compass-course signals in fog; long and short blasts.

W. Whittle, Steamer "Georgia," to Branch Hydrographic Office, Virginia.

Advocates helm-signals in fog, which should be compulsory.

Speed in Fog.—No vessel should go at a speed greater than that at which she can hear the signal of another at a distance sufficient to stop; vessel in doubt should stop at once.

Branch Hydrographic Office, Philadelphia, Pennsylvania.

Steamers should carry two whistles. Is in favour of a code of compass course-signals; not more than 3 notes in any one compass-signal; 8 compass-courses.

Helm-signals, in all weather, should be compulsory.

Branch Hydrographic Office, Portland, Oregon.

In favour of a code of compass course-signals; four points. Helm-signals should be compulsory.

W. R. Mayo, United States' Customs, to Chamber of Commerce, Virginia.

Compass-course signals in fog inadmissible.

Helm-signals good if steamers approaching adopt precaution of slowing down and feeling their way past each other.

Opinions collected by Branch Hydrographic Office, New York.

Against course-signals.

Helm-signals should be compulsory. Advises a number of successive whistles to call attention of vessel or steamer ahead to that overtaking it. Sailing-vessel running with free wind must conform to signals of steamers.

Speed in foggy weather cannot be accurately determined in miles; sailing-vessels should be obliged to obey rule.

Providence and Stonington Steam-ship Company.

Advises one long blast of whistle, 8 seconds' duration, at intervals of 30 seconds. As position signal in fog recommends automatic machine; also compass-course signals showing 8 points. Steamers towing should have a distinctive signal. All fog-horns should be inspected. Signals on horns of sailing-vessels should be on the same principle as steamers' whistles; no use to indicate tack. Against a new code of signals, if it is at cost of simplicity. Bells should be regulated by law. Considers present arrangement as to helm-signals in United States' waters good. Signal for stopping should be regulated; it should be specified whether "I am stopping" refers to vessel or engine. Helm-signals should be compulsory in all conditions of the atmosphere. Speed in fog should be rapid, provided ships stop or slow immediately on hearing another vessel's fog-signal.

Opinions sent to Ensign Blow.

Lieutenant H. Barrol, United States' Navy.—Recommends slowing down in fog. Unqualified objection to any additional fog-signal.

Captain Yates, United States' Navy.—Recommends two whistles and eight compass-course signals by long and short blasts. In favour of helm-signals.

Commander Cooper, United States' Navy.—Agrees with Captain Yates.

Captain Batchelder, United States' Navy.—Agrees.

Captain Wise, United States' Navy.—Compass-course signals could not be used on merchant-vessels.

T. L. Moffat. United States' Navy.—Recommends only distress-signal.

A. P. Cooke, United States' Navy.—Mr. Blow's system of signals too elaborate.

C. A. Adam, United States' Navy.—Agrees with Mr. Blow's code.

J. A. Clampett, United States' Navy.—Also agrees.

Mr. T. Bryde, Master Mariner.—Approves of Mr. Blow's system, if only used for the four quadrants.

Mr. G. Moodie (steam-ship "State of Georgia").—In favour of code.

H. P. McIntosh, United States' Navy.—Against long and short blasts.

Captain Laub ("Thingvalia").—Advocates stopping when whistle is heard. Wants signal for vessel that is to keep her course.

Captain T. McKee ("Yamassee").—In favour of running slow in fog.

E. Kimble (steam-ship "Iroquois").—Sailing-vessels should have better horns. In favour of compass-course signals to indicate eight courses.

Clyde's Coastwise and West India Steam Lines (Wm. P. Clyde and Co.).

H. A. Bearse, Steam-ship "Cherokee."

Sound-signals for sailing-vessels should be better, *i.e.*, steamers are good in favour of four compass course-signals by short and long blasts. In fog or thick weather half rate of speed, so as to have full control of the vessel.

Captain S. C. Platt, Steam-ship "Seminole."

On examination of the code of fog-signals of Mr. J. R. Hughes, he would call it impracticable. Whistles should be made much larger and sounded oftener; sailing-vessels should make a louder noise at shorter intervals.

Captain N. D. Ingrans, Steam-ship "Benefactor."

Steamers should not be allowed to run at full speed, but should stop to locate a sound. Recommends a steam-siren of uniform size, giving a sound at regular intervals, and a steam-whistle for giving and answering signals within safe hearing distance, so that after hearing the siren the whistle only should indicate by the blasts if the ship is porting or starboarding. For sailing-vessels recommends an automatic compressed air-horn and a large bell when at anchor.

Master Mariner F. W. Fuler.

Only about lights.

Master Mariner A. Schück, from Hamburg.

No observations on sound-signals.

Commander C. W. Kennedy, White Star Steamer "Germanic."

Eight sound-signals are all that is required.
No systems given.
Helm-signals, now optional, should be compulsory.
Two powerful steam-whistles, one deep, one shrill-toned, to give these signals.
Instead of the fog-horns for sailing-vessels, recommends a gong; the horns only for fishing-vessels.
A small cannon for pilot-vessels on the stations; the gong when off the stations.

James A. Dumont, Supervising Inspector-General.

Thinks that the intervals between sound-signals should be one, and not two, minutes. No course-signals should be given. Ships should run slow in fog, with frequent stoppages. Bells should be rung every two minutes. Helm-signals in all weather should be compulsory.

The National Board of Marine Underwriters, New York.

Recommends the siren-horn for steamers; improved fog-horns, worked by levers, for sailing-vessels. In favour of introduction of course-signals for steamers and sailing-vessels. Vessels should stop on becoming aware of proximity. There should be special signals for a steamer towing to designate number of vessels towed. Helm-signals should be compulsory. Recommends bell or short blasts of whistle for ships not under command. In fog, vessels should go full speed in open sea, but should slow down on approaching the coast.

Philadelphia Maritime Exchange.

Recommends use of whistles of regulated power. The signal-code should be simple and always definite. An alarm-gun or bomb should be fired when a vessel approaches from a quarter where it is impossible that a whistle can be heard.

Liverpool Humane Society.

Thinks sound-signals should be used more systematically. Recommends gong for pilot-boats. The use of gongs for light-ships should be abandoned.

Appendix (B) to Report of Committee on Sound-Signals.

Course-indicating Signals.

IN order to obtain the opinion of a number of practical and experienced seamen as to the advisability of adopting some system of course or route indicating sound-signals for use in fog, mist, or falling snow, the Board of Trade caused copies of the following letter, dated 11th March, 1889, and of the inclosures, papers (A), (B), (C), (D), and (E), to be sent to forty-four of the principal firms of ship-owners and to five Ship-masters' and Seamen's Societies. Each firm of owners was invited to obtain the opinions of six of their most experienced masters upon the question printed at the head of the letter. An abstract of the replies received will be found at p. 175.

Proposals respecting Course-indicating Sound-Signals.

Marine Department, Board of Trade, 7, Whitehall Gardens,
Sir, *London, March* 11, 1889.

The question for consideration, and on which your opinion is invited, is as follows, viz. :—

"Is it practicable, and, if so, is it advisable, to introduce some system of course or route indicating sound-signals to be made by steam-ships under way in fog, mist, or falling snow, when neither can see the other ?"

And on this question I submit, for your consideration and advice, the following observations :—

1. The present law on the subject of "sound-signal" and "course-indicating signals" is contained in Articles 12 and 19 of the International Regulations, which are as follows :—

Sound-Signals for Fog, &c.

"Art. 12. A steam-ship shall be provided with a steam-whistle, or other efficient steam sound-signal, so placed that the sound may not be intercepted by any obstructions, and with an efficient fog-horn, to be sounded by a bellows or other mechanical means, and also with an efficient bell.* A sailing-ship shall be provided with a similar fog-horn and bell.

"In fog, mist, or falling snow, whether by day or night, the signals described in this Article shall be used as follows, that is to say :—

"(*a.*) A steam-ship under way shall make with her steam-whistle, or other steam sound-signal, at intervals of not more than two minutes, a prolonged blast.

"(*b.*) A sailing-ship under way shall make with her fog-horn, at intervals of not more than two minutes, when on the starboard tack, one blast ; when on the port tack, two blasts in succession ; and when with the wind abaft the beam, three blasts in succession.

(*c.*) A steam-ship and a sailing-ship, when not under way, shall, at intervals of not more than two minutes, ring the bell.

"Art. 19. In taking any course authorized or required by these Regulations, a steam-ship under way may indicate that course to any other ship which she has in sight by the following signals on her steam-whistle, viz. :—

"One short blast to mean, 'I am directing my course to starboard.'

"Two short blasts to mean, 'I am directing my course to port.'

"Three short blasts to mean, 'I am going full speed astern.'

"The use of these signals is optional, but, if they are used, the course of the ship must be in accordance with the signal made."

N.B.—It is to be noted that Article 19 only applies when the vessel making the signal has the other vessel "in sight."

Article 13, respecting the speed of ships in fog, &c., is in the following terms :—

Speed of Ships to be Moderate in Fog, &c.

"Art. 13. Every ship, whether a sailing-ship or steam-ship, shall, in a fog, mist, or falling snow, go at a moderate speed."

2. The International Code of Signals Committee recently appointed by the Board of Trade have taken steps to ascertain whether there is a general demand on the part of the mercantile marine for the establishment of some system whereby the signals in the International Code Book may be made by night as well as by day.

In the course of their *interim* Report, dated 15th January, 1889, the Committee state as follows :—

"So far as we have been able to ascertain at present, there appears to be no general demand on the part of the mercantile marine for the establishment of a general system of night signalling. At the same time we think it advisable to adopt some plan by which a few urgent and important signals may be made by night as well as by day."

The signals selected by the Committee for this purpose are as follows :—

Urgent or important signals which may be made at night or during fog, either fly flashes of white

* In all cases where the Regulations require a bell to be used a drum will be substituted on board Turkish vessels.

light or by a combination of long and short sounds on the steam-whistle, fog-horn, siren, bugle, &c. In the daytime they will be made by flags, if the weather is clear.

Instructions for the Use of Flashing or Sound-Signals.

(1.)

With flashing signals, the lamp must always be turned toward the person addressed.

(2.)

To attract attention, a series of rapid short flashes or sounds should be made and continued until the person addressed gives the sign of attention by doing the same.

If, however, it is supposed that the person addressed cannot reply, the signal may be made after a moderate pause, or, under certain circumstances, the communication may be made direct, without preparatory signs.

(3.)

After making a few rapid short flashes or sounds as an acknowledgment, the receiver must watch, or listen attentively, until the communication is completed, when he must make the sign indicated below, showing that the message is understood.

(4.)

If the receiver does not understand the message, he must wait until the signal is repeated.

(5.)

Duration of short flashes or sounds	1 second.
„ long „ „	3 seconds.
Interval between each flash or sound	1 second.
Answer, or "I understand"	—·—·—·—, &c.

Flags.	*Signals.*	*Flashes or Sounds.*
NP	I want assistance. Please remain by me	·——
JK	You are standing into danger	———
PG	Beware of derelict, dangerous to navigation	———
QC	Have encountered ice	———
PD	The way is off my ship, you may feel your way past me	——·—
JB	Stop, or heave to; I have something important to communicate	——·—·
PR	Am disabled. Communicate with me	——·—

When a vessel is in "tow," the following flashes or sounds may be made from her to the tug or towing vessel:—

KR	Steer more to port	—·
KS	Steer more to starboard	·

The International Code of Signals Committee having thus accepted the principle that it is advisable to adopt certain few special sound-signals, the Board of Trade have requested the Committee further to consider and report upon the following points:—

"Whether, in the interests of safety, it is desirable to establish a system of sound-signals to be used by steam-vessels during foggy weather to denote the direction in which they are proceeding.

"Whether, on the same grounds and for the same purposes, it is necessary to establish a system of sound-signals to be used by sailing-vessels under like circumstances.

"Whether such system should be limited to crowded waters and narrow seas near coasts, or whether it should be extended to the open seas also.

"If any system is deemed by the Committee to be practical, what that system is."

These matters are accordingly receiving careful consideration, and will be referred to in the Final Report of the Committee.

3. The present International Rules as to sound-signals are based on the assumption that in a fog, mist, or falling snow, a vessel is to go at a moderate speed, and to blow a whistle or fog-horn as a warning that she is somewhere in the locality (Article 12), and as a caution to other vessels that may be in her neighbourhood. Nothing more is intended to be conveyed by the signal sounded under the existing Regulation by a steam-vessel in thick weather. In clear weather, as has been pointed out, a steam-ship may indicate an alteration in her course to any other ship which she has in sight by certain specified signals (Article 19).

4. *Sailing-ships.*—A sailing-ship is at present required to indicate the tack she is on with the wind forward of the beam, or, if running with the wind abaft the beam, to indicate the same by another distinctive signal.

5. It would, therefore, as far as steam-vessels are concerned, effect fundamental alteration in the principle of the Rules if a system of sound-signals were to be now adopted with the object of indicating the course of the steam-vessel making that signal in a fog, &c.

6. The many proposals which have been made to the Board of Trade from time to time regarding course-indicating signals to be used by ships under way in fog, &c., may be fairly described as of two broad classes: one class being founded on compass-courses, and the other on routes. The paper marked (A) is an attempt in the direction of indicating compass-courses, and that marked (B) is an attempt in the direction of route-courses.

Please understand that the papers (A) and (B) inclosed do not lay any claim to originality; they are rather examples of the two classes of proposals collated on the very numerous suggestions which have been made on the subject, and to which I have already referred.

7. I should also like to call your attention to the fact that in 1883 the Council of the Society of Arts appointed a Committee to consider the question of collisions at sea. In addition to Sir W. Siemens (who, as Chairman of the Council of the Society, was an *ex officio* member), the following gentlemen composed the Committee:—

Sir A. Ryder (Chairman), Sir Frederick Abel, Sir Frederick Bramwell, Andrew Cassels, Esq., Lord Alfred S. Churchill, B. Francis Cobb, Esq., Sir Edward Inglefield, Loftus Perkins, Esq.

A Preliminary Report, prepared by Admiral Ryder for submission to this Committee, was printed in the "Journal of the Society of Arts" for the 2nd May, 1884. No Report signed by the members of the Committee appears to have been issued.

The following extract from this Preliminary Report of Admiral Ryder refers specially to fog-signals and course-indicating signals:—

"2. Nearly all the methods proposed assume the desirability of a code, international or not, of fog-signals, and in many of the inventions great ingenuity has been displayed. Supposing the objections to an elaborate code to be got over, there can be little doubt that several of the systems proposed would be very well adapted for the purposes required. The Committee, however, after giving special attention to the question of an international code of fog-signals, have come to the conclusion that the introduction of an international code for use by merchant-ships would be more likely to cause confusion or disaster than to conduce to safety: first, because the difficulty of making intelligible signals in a fog is very great; and, secondly, because it is to be feared that the authorization of such a code would foster a fancied feeling of security and encourage the practice of steaming at high speed under dangerous circumstances. The Committee believe that the utmost that could be done would be an indication of the direction of the ship's head as regards the vessel she is signalling to, as proposed by Mr. Rothery; and, in crowded channels, the indication by steamers of the fact that they were outward or homeward bound. At the same time, the Committee are fully sensible of the desirability of increasing by all possible means the power of fog-horns and the general adoption of some form of 'siren' (an improved steam-whistle) for use on board ship."

8. Before the International Code of Signals Committee proceed to a consideration of the points referred to them, I am anxious to obtain for them the opinion of a few practical persons qualified to speak with authority on the subject from the point of view of the ship-owners and officers of the mercantile marine.

9. Under these circumstances, I shall be much obliged if you will kindly furnish me (confidentially) with your own opinion as to the necessity or desirability of extending the present Regulations, so as to include either compulsory or optional course-indicating signals for use in fog, mist, or falling snow when vessels under steam or sail cannot see each other.* I shall also be glad to receive the opinions of any of your experienced masters on the same subject. If, in your opinion, it is both practicable and advisable to establish some system of course-indicating signals for use during fog, &c., when ships under way cannot see each other, it would further be of material assistance to the Committee if the nature of the system you prefer be indicated.

10. I cannot withhold an expression of my own opinion that some of the objections in the paper marked (C) call for the very gravest consideration, and I feel that the Committee, before recommending the adoption of course- or route-indicating signals by ships in fog, &c., will need to be well assured that the adoption of any system would not be the means of increasing, rather than of diminishing, the present risk of collision, by encouraging masters, under the false security of trusting to the use of course or route-indicating signals, to run greater risks than at present by not reducing speed, and by altering the ship's course in fogs when neighbouring vessels are not in sight, on the strength of sound-signals that cannot be located with certainty.

11. The Committee appointed to consider these questions are Colonel H. M. Hozier, Admiral Sir F. L. McClintock, F.R.S., Sir D. Murray, Bart., Admiral Sir G S. Nares, K.C.B., Admiral N. Bowden-Smith, and Captain C. P. Wilson, with myself as Chairman.

I am, &c.
(Signed) THOMAS GRAY.

---

* *Note.*—In this connection I must ask you to bear in mind that the Committee have already tentatively recommended for adoption the signal PD (▬ ▬▬ ▬) to be used by a steam-ship which cannot see the other, to signify that the way is off the steam-ship making it, and that the steam-ship hearing it may feel her way past the steam-ship making it.—T. G.

Paper (A).

Memorandum by Admiral N Bowden-Smith.

Suggestions respecting Fog-Signals.

Sir, 16, *Queen's Gate Terrace, London, January* 5, 1889.

I send you herewith my answers to the questions relating to fog-signals at sea, with suggestions for the consideration of the International Code Committee.

May I ask you to forward me a copy of suggestions made by other members of the Committee that I may consider them before the next meeting?

I have, &c.
(Signed) N. BOWDEN-SMITH.

The Secretary,
International Code of Signals Committee.

RELATING to Fog Signals at Sea.

Questions.	Answers.
Whether in the interests of safety it is desirable to establish a system of sound signals to be used by steam-vessels during foggy weather to denote the direction in which they are proceeding.	Yes.
Whether on the same grounds and for the same purpose it is necessary to establish a system of sound-signals to be used by sailing-vessels under like circumstances.	Consider the existing fog-horn signals are sufficient.
Whether such system should be limited to crowded waters and narrow seas near coasts; or whether it should be extended to the open sea also.	It should be extended to the open sea, for though in some parts of the world vessels do not traverse the same route on their outward and homeward voyage, there are other seas on which steamers pass each other on the same track.
If any system is deemed by the Committee to be practical, what that system is.	The simplest system would appear to be an arrangement of blasts on the steam-whistle as described hereafter, the bell being reserved for ships at anchor as at present.

The following proposals for denoting the approximate course of a steamer in a fog have no pretensions to originality.

They resemble many of those suggested in the abstract of fog-signals tabulated by the Marine Department of the Board of Trade, notably No. 28, by Mr. J. H. Garfit.

It is proposed to authorize eight combinations of long and short blasts, which will be readily understood by referring to the diagram.

From the North section to the S.E. section the signals will commence with one long blast; from the South section to the N.W. section with two long blasts.

The duration of the long blasts to be four seconds, the short blasts one second, with one second intervals; thus it will require fifteen seconds to make the longest or N.W. signal.

It would not be desirable to introduce more than two long blasts on account of the length of time they occupy.

This system would seem to work well in the English Channel, where a large majority of the steamers would every two minutes be making the N.E. or the S.W. signal. Again, on the coast of Portugal, where fogs are very prevalent, they would be nearly all steering North or South, and sounding the corresponding signals.

With regard to vessels altering their course in a fog, they should be directed to continue making the same sounds until they had actually changed into another section: thus, if a ship has been steering N., and altered to N.N.E., she should continue blowing one long blast till she was steering to the Eastward of N.N.E. It is the case that in this way two ships may for a time be steering the same course though uttering different sounds, such as on a N.N.W. course, where one vessel might be sounding one long blast, and the other two longs and three shorts: but this cannot well be avoided.

S

The present system of all steamers sounding one prolonged blast gives no indication whatever of the direction in which they are proceeding, but the proposed scheme, though it lays down no fresh instructions as to how the officers in charge are to act, should help them to form a decision in carrying out the Rule of the Road

A vessel stopped, and having no way on, to sound three long blasts every two minutes.

The long blasts in this case to be of eight seconds duration, with two seconds interval.

Paper (B).

Memorandum by Sir George Nares.

Proposed adoption of a System of Sound-Signals to denote in Foggy Weather the Direction in which a Vessel is proceeding.

At present a sailing-vessel's fog-signal, if she is close hauled, coupled with the known direction of the wind, gives a more or less accurate indication of the direction in which she is proceeding. The fog-signal of a sailing-vessel with a fair wind, and that of a steam-vessel, indicates the vessel's presence alone. Even if the sound is located it is only by the increased loudness, or a change in the direction of succeeding signals, that a guess can be made as to the direction in which the vessel is proceeding.

If unconfusing and readily learnt Sound-signals can be introduced, giving better information regarding the direction in which a vessel is proceeding, an officer hearing such a signal would be less embarrassed than he now is, and he would be placed in a better position for more readily adopting any further precautions that the situation required.

The adoption of additional "Course" or "Direction" fog-signals by vessels should in no way interfere with the present Rules regarding the right of way of one vessel over another vessel.

All vessels must take the same full precautions to prevent a collision that they are required to take now.

The provision under Article 13, providing that in a fog, &c., every ship shall go at a moderate speed, and that under Article 17, providing that a steam-vessel shall keep out of the way of a sailing-vessel, should in no way be relaxed or interfered with.

Article 19, regarding helm-signals, should, as at present, only apply to vessels actually in sight of one another.

The reading of another vessel's fog-signal incorrectly should in no case be accepted as any excuse in the event of a collision occurring.

New "Course" signals should conflict as little as possible with the signals at present in use; and considering the crowded navigation of many districts, the additional symbols adopted and the number of sounds forming any one signal should be the fewest and simplest possible.

Compass-signals are thus precluded from consideration. For any compass system requires that the officer in charge should remember and be in the expectation of hearing at least eight different symbols; if only four were used, vessels steering within 89 degrees of each other—that is, crossing each other's course almost at right angles—would be sounding the same signal.

There remains only for consideration some system similar in principle to the "Route" systems suggested by Captain Honourable F. G. Crofton, R.N., Captain Wilcox, and others.

As a modification of the various proposals, I submit for consideration the following "Direct Route" systems, involving two additional signals for vessels steering along a "Direct Route" into and out of harbour, port, or river; and two for vessels bound in one and the other direction along a "Direct Sea Route," four in all; leaving steam-vessels on "Cross Ferry" or "Cross Channel" passages to sound a modified form of the present prolonged steam blast; and all other "Crossing Vessels," that is, all vessels crossing a "Direct Sea or Harbour Route" at a greater angle than 45 degrees, to use, if a steamer, the single prolonged steam blast now in use for all steam-vessels under way; if a sailing-vessel, the fog-horn signals authorized at present.

These systems are distinct in themselves. The Harbour, &c., system can be adopted irrespectively to the Oceanic system, and *vice versâ*.

If these proposed signals are adopted, although the number of sounds made by vessels will be increased, the actual number of signals heard at any one time will remain the same as at present.

By the adoption of signals made up of sounds of different character the well-known difficulty of correctly locating a signal will, I think, be lessened: certainly will not be increased.

The "Direct Route" System of Fog-Signals.

(*A.*) Vessels proceeding, or when not at anchor wishing to proceed, along a "Direct Route" when entering or leaving a port, harbour, or river, shall sound during fog, &c., one of two signals according to the direction in which she is proceeding along the "Direct Route."

At present in whatever direction a steam-vessel is proceeding she sounds one prolonged steam blast to denote a steam-vessel under way. As the two simplest additional symbols, I propose to add directly after the prolonged (long) steam blast one short steam blast to indicate a steam-vessel proceeding along a "Direct Route" into port, &c., and two short steam blasts to indicate a steam-vessel proceeding along a "Direct Route" out of port, &c., that is:—

Entering port, &c., long; short ... ... — -

Leaving port, &c., long; short, short ... ... — - -

Sailing-vessels proceeding along a "Direct Route" when entering or leaving port, &c., if on the starboard or port tack to sound the present fog-signals. If with the wind abaft the beam to sound on the fog-horn instead of the present three blasts, the same signals as proposed for steamers to sound with the steam blast.

(*B.*) Vessels proceeding, or when not at anchor wishing to proceed, along a "Direct Route" in any sea or water where fogs are experienced, and which is specially defined as a "Direct Route" for sound-signal purposes during fog, shall sound during fog, &c., one of two signals according to the direction in which she is proceeding along the "Direct Route."

For these vessels I propose, as the signals next simplest and distinct in character, to add directly after the prolonged steam blast, denoting a steam-vessel under way, one short and one long steam blast to indicate a vessel proceeding in one direction; and the opposite symbol, or one long and one short steam blast, to indicate a steam-vessel proceeding in the opposite direction, that is:—

For one direction, long; short, long ... ... — -
The opposite direction, long; long, short ... — — -

A sailing-vessel proceeding along a "Direct Sea Route" with a fair wind to sound the above on her fog-horn in lieu of the present three blasts.

A steam-vessel not at anchor but completely stopped to ring her bell, but only at the same time as and while sounding her "Direct Route" signal for the direction she wishes to take along the "Direct Route;" or while sounding the "Cross Channel" signal if wishing to cross the "Direct Route."

A vessel altering her course to clear another vessel in sight to sound the helm-signal now allowed optionally.

(*C.*) Steam-vessels employed on "Cross Ferries" and on established "Cross Channel" passages shall modify the prolonged steam blast, denoting a steam-vessel under way, so that the sound shall either commence low and be gradually raised, or commence loud and be gradually lowered.

In British waters all steam-vessels crossing a "Direct Sea Route" on an established "Cross Channel Route" shall, when bound towards Great Britain, sound a prolonged steam blast, which shall commence as abruptly as possible, loud, and be gradually lowered in tone; when bound from Great Britain shall sound a prolonged steam blast which shall commence in a low tone, and gradually increasing in loudness, end loud, as abruptly as possible.

(*D.*) Vessels crossing a "Direct Harbour, &c., Route," or a "Direct Sea Route," other than those specified under (*C*), and all vessels navigating districts not specially defined as "Direct Routes" for fog-signal purposes—or specially exempted—to sound the signals now authorized.

If a steamer, a prolonged steam blast.

If a sailing-vessel, one, two, or three blasts on the fog-horn.

As almost all "Direct Sea Routes" in foggy districts, in both the Atlantic and Pacific Oceans, are in a direction easterly and westerly, those directions may suitably form the basis for conformity in an adopted "Direct Route" system of signals.

Thus, with a very few exceptions, vessels steering an Easterly course along a specified "Direct Sea Route" sound in fog, &c.:—

Long; short, long ... ... — -

Those steering a Westerly course, sound—

Long; long, short ... ... — — -

EXAMPLES.

Proposed "Direct Sea Routes."

Vessels on the routes mentioned, sound—

Long; short, long ... ... — -

Vessels steering in the opposite direction, sound—

Long; long, short ... ... — — -

North Atlantic.

Northward and North Eastward...	Along East Coast of North America.
Eastward	Out of Gulf of St. Lawrence.
Eastward	Across North Atlantic.
South Eastward	From North of Ireland towards Liverpool.
North Eastward	From South of Irish Channel towards Liverpool.
Eastward	Up English Channel.
Northward	From Cape St. Vincent along coast of Portugal.
Eastward	Across Bay of Biscay.

North Sea.

North Eastward	From English Channel to North West European ports south of Skagerrack.
North Eastward	From English Channel to Baltic.

North Eastward	...	... From Thames to Baltic.
North Eastward	...	... From European Ports to Baltic.
Northward ...	...	... In North Sea along coast of Great Britain.
Eastward ...	...	... From an offing of 80 miles off British Coast to Baltic.

Baltic.

Southerly ...	...	... In Kattegat, the Sound, and the Belts.
North Eastward	...	... In Baltic.
Eastward ...	...	... In Gulf of Finland.
North Eastward	...	... In Gulf of Bothnia.

Mediterranean, &c.

Eastward ...	...	... Gibraltar to Cape Bon, Malta, and Egypt.
Eastward ...	...	... „ Cape De Gata, and Cape Creux, Gulf of Lyons.
South Eastward	...	... Offing off Gulf of Lyons to Skerki Channel.
South Eastward	...	... „ „ Bonifacio Strait.
Eastward ...	...	... „ „ offing in Gulf of Genoa.
South Eastward	...	... Offing off Gulf of Genoa to Maretimo and Malta.
South Eastward	...	... „ „ Strait of Messina, and off Syracuse.
South Eastward	...	... In Adriatic and along West Coast of Greece.
South Westward	...	... From Adriatic to offing off Cape Spartivento.
Eastward ...	...	... Candia to Egypt.
North Eastward	...	... Cerigo to offing off Dardanelles.
Northward ...	...	... On East side of Archipelago.
North Eastward	...	... On Coast of Syria.
North Eastward	...	... On West shore of Black Sea.
North Eastward	...	... Offing North of Bosphorus to Crimea.
North Eastward	...	... „ „ Kertch Strait.
South Eastward	...	... Kertch Strait to offing off Batoum.
Eastward ...	...	... On South shore of Black Sea.
North Eastward	...	... Offing North of Kertch Strait to Gulf of Azov.

North Pacific.

North Eastward	...	... In China Sea.
Northward ...	...	... In Yellow Sea.
North Eastward	...	... In Japan Sea.
Eastward ...	...	... Across North Pacific to offing off American Coast.
South Eastward and Southward		... Along West Coast of North America.

In the Atlantic the "Direct Routes," as distinct from the "Crossing Routes," that do not trend in a direction easterly and westerly are:—

1. East coast of Ireland trending northerly and southerly.
2. West coast of Portugal and France trending northerly and southerly.
3. East coast of Great Britain trending northerly and southerly.
4. The Kattegat, Sound, and Belts trending northerly and southerly.

The principle adopted for these districts is that vessels sound the signal they would sound on an extended voyage before or after passing through the districts named.

1. Vessels steering eastward and rounding Tuskar Lighthouse on a northerly course continue to sound the easterly "Direct Sea Route" signal; while, as provided for under (*D*), in the specially exempted district between Rockabill Lighthouse and the Isle of Man, they sound the present authorized signal; on passing westward of the south point of the Isle of Man they join the "Direct Sea Route" passing through the Irish Channel.

Vessels rounding the north of Ireland on an easterly course continue to sound the easterly "Direct Route" signal until abreast the south point of Isle of Man, after which if bound south along the coast of Ireland they sound the present authorized signal until passing Rockabill, when they join the "Direct Route" rounding the S.E. point of Ireland.

2. Vessels steering a northerly course along the coast of Portugal sound the easterly "Direct Route" signal.

3. Vessels steering a northerly course up the North Sea near the British coast sound the easterly "Direct Route" signal until entering the specially exempted district off Kinnaird's Head, when they would sound the present authorized signal until nearing the Pentland Firth and joining the "Direct Sea Route" passing north of Scotland.

Vessels steering a southerly course from the east entrance to the Pentland Firth would sound the present authorized signal until off Kinnaird's Head, after which they would sound the westerly "Direct Route" signal.

4. Vessels entering the Baltic continue to sound the easterly "Direct Route" signal while passing southward through the Kattegat, the Sound, and the Belts. Vessels leaving the Baltic continue to sound the westerly "Direct Route" signal while passing northward through the Sound, the Belts, and the Kattegat.

"Cross Channel" Passages which would sound the Signals defined under (C).

Crossing the English Channel "Direct Sea Route."
Crossing the St. George's and the North Irish Channel "Direct Sea Routes."
Crossing the Bay of Biscay "Direct Sea Routes."
Crossing between the East British ports North of London and the Baltic, while westward of an offing of 80 miles from the British coast, and crossing the North Sea "Direct Sea Route."
Crossing the "Direct Sea Route" between Sardinia and Italy.
Crossing the "Direct Sea Route" in Malta Channel, and South of the Strait of Messina.
Crossing the "Direct Sea Route" between the Bosphorus and the Crimea.
Crossing the "Direct Sea Routes" at the entrance to the Gulfs of Genoa and Lyons.

Sea Routes which would be specially exempted under (D).

1. Ocean Routes which cross a more frequented ocean route which has been defined as a "Direct Sea Route;" as—
Between the Scilly Isles and ports north while crossing the Bristol Channel.
2. Vessels requiring to change from the Eastward to the Westward bound signal while on the same voyage; as:—
The West European and Mediterranean trade while between Gibraltar and Cape St. Vincent.
Between the Archipelago and Egypt while passing Kaxo Island.
3. Vessels on a "Direct Sea Route" which would meet each other after rounding an island; as:—
The Atlantic trade with ports on the east coasts of the British islands, while navigating between stated points, as Rockabill and south end of Isle of Man; and Kinnaird's Head and the Pentland Firth.

If the proposed "Direct Route" signals for entering and leaving ports, &c., are adopted by the local harbour authorities, they would apply specially to vessels navigating within the local limits of each port.

If the "Direct Sea Route" is adopted by international agreement, I propose that the outer or sea limits of each local district should be for fog-signal purposes extended seaward to the line of "Direct Sea Route" nearest to the port, &c., or to some clearly defined area in the offing of the ports, &c.

Thus the "Direct Port, &c., Route" signals would apply equally to all vessels on the landward side of a "Direct Sea Route" that were approaching the land or steering out from the land to sea. On these vessels arriving on a "Direct Sea Route" and steering along it they would alter their signal from "Outward Bound" to the "Direct Sea Route" signal. On arriving near a "Direct Sea Route" and crossing it, they would sound the "Cross Channel" signal or the present authorized signal.

For a port like Constantinople the "Inward and Outward Route" signals would extend to an offing S.W. of the Dardanelles and to an offing North of the Bosphorus.

NEW SIGNALS PROPOSED.

STEAM OR FOG-HORN. Steam blast if a steam-vessel; fog-horn if a sailing-vessel with wind abaft the beam.

— . Vessel entering port, &c., or approaching land on a "Direct Route."

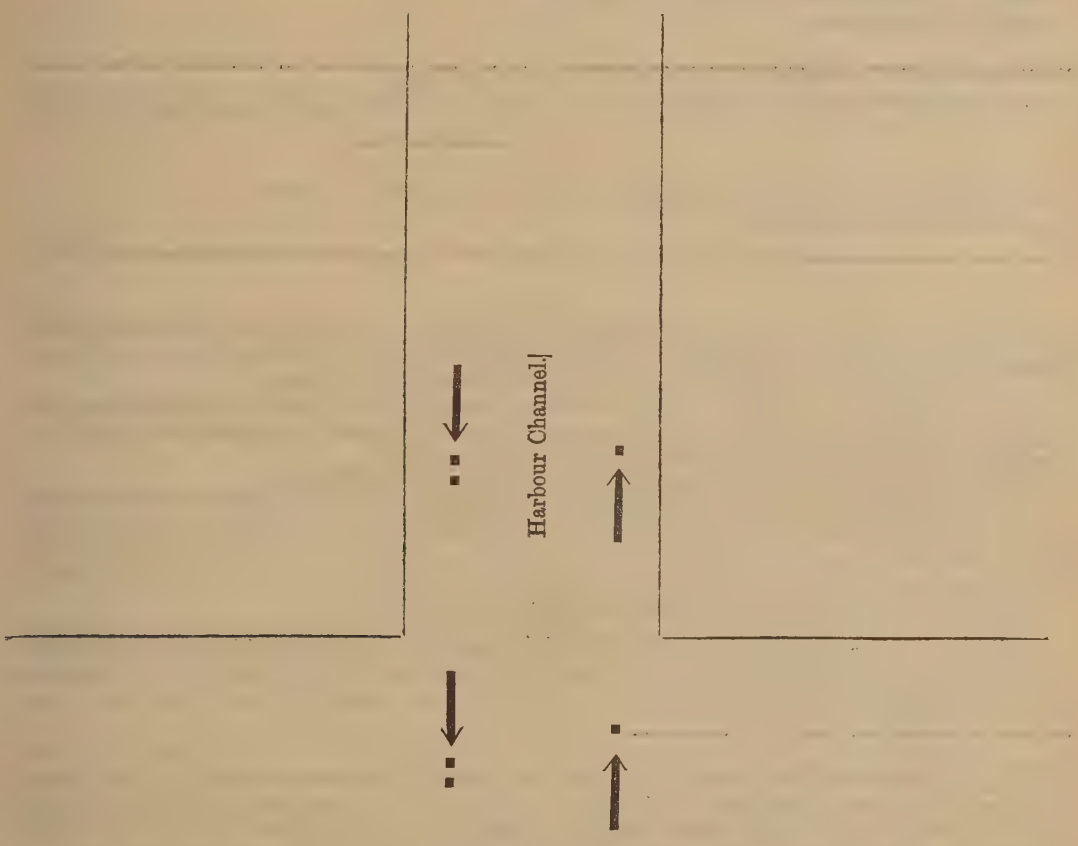
— . . Vessel leaving port, &c., or steering out from land on a "Direct Route."

— . — Vessel steering easterly* along a "Direct Sea Route."

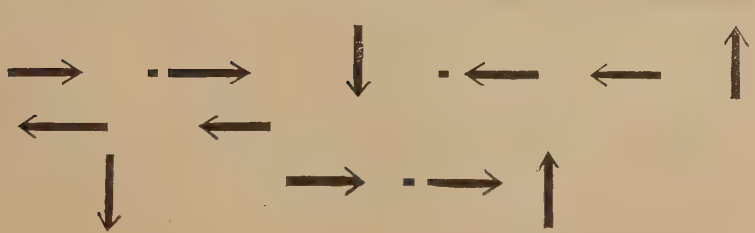
— — . Vessel steering westerly* along a "Direct Sea Route."

STEAM BLAST WITH BELL. Steam-vessels stopped, but not at anchor.

Example.



"DIRECT SEA ROUTE."



To the Secretary,
International Code of Signals Committee.
February 14, 1889.

* Except in a few special districts.

Paper (C).

Memorandum by Sir Digby Murray.

FOG-SIGNALS AT SEA.

Questions in the extended Reference to the Committee.	Replies.
Whether in the interests of safety it is desirable to establish a system of "Sound-Signals" to be used by steam-vessels during foggy weather to denote the direction in which they are proceeding.	No.
Whether on the same grounds and for the same purpose it is necessary to establish a system of "Sound-Signals" to be used by sailing-vessels under like circumstances.	No.
Whether such system should be limited to crowded waters and narrow seas near coasts; or whether it should be extended to the open sea also.	It is less applicable to crowded waters where many steamers may be approaching one another at the same moment than it would be to the open sea.
If any system is deemed by the Committee to be practical, what that system is.	In my opinion no system.

Reasons.

When the late Rule of the Road Committee framed the course signals, Article 19 of the present Regulations, they were most careful to impose the restriction that they should only be used by a steam-ship under way to indicate her course "to any other ship which she has in sight."

This conclusion was arrived at without one single dissentient, as it was felt that to encourage the officer of any ship to alter her course in consequence of hearing a sound, the distance and direction of of which was necessarily unknown to him, would be fatal to safety.

I am still of opinion that the Committee in this exercised a wise discretion.

The collision which occurred between the steam-ships "Britannic" and "Celtic" on the 19th May, 1887, was brought about by the commander and second officer of the "Britannic" thinking the fog-whistle which they heard was on their port bow and porting to avoid it, whereas the sound was really on their starboard bow, and when the "Celtic" was at last sighted it was too late to avoid collision. both ships had kept their courses there would have been no collision.

On the 5th January, 1889, the steam-ships "Kenley" and "Pione" were approaching one another in a thick fog in the North Sea. The "Kenley" improperly ported and blew one blast of the steam-whistle before seeing the "Pione." (It is uncertain whether the "Pione" did or did not blow two blasts and starboard, as the case has not yet been heard in the Admiralty Court.) The result was a collision in which the "Kenley" was sunk.

In crowded waters and narrow channels it is possible, and indeed it often happens, that several steamers are approaching one another at the same time, and if, as has been suggested, all these vessels are to make distinctive signals indicating their course, or if, as has also been suggested, vessels following the direct route are to make distinctive signals in accordance with their direction, and vessels crossing the direct route are to make different signals, the position and distance of all these vessels being unknown with regard to one another, the result to my mind would be most confusing.

Let us consider, with the assistance of a few diagrams, the least complicated of these proposals, "The direct route system in the open sea."

↓B 1. ↓B 2. ↓B 3.

↑ A.

A is a steam-ship bound from New York to the eastward, and consequently on a direct route and making the signal proposed for direct route vessels bound to the eastward. The officer of the watch

hears a signal from another steam-ship bound in the opposite direction, which sound may be in the direction marked B 1, B 2, or B 3, or possibly much broader upon either bow, and the distance of which is unknown. What should the officer of the watch or commander of the ship do?

Undoubtedly keep his course, but get the way off his ship as quickly as possible. If the approaching steam-ship is either in the position B 1 or B 3, the two ships will both clear one another, provided that neither alter their course.

The two steamers have a beam respectively of 41 and 45 feet (the beams of the "Britannic" and "Celtic"), and the odds are very greatly against a collision stem on; but even if it does take place, the consequences are far less likely to be serious than if either vessel ported or starboarded, and in that manner exposed her broadside to the other.

Let me now suppose that this vessel bound to the eastward hears the signal of a crossing steamer bound, say, from some one of the southern ports to Boston.

If the officer of watch A could be certain the crossing steamer was in the position B 1 or B 2, and standing to the northward, he might proceed in safety, but she might be in the position B 3, or even more on his starboard bow, or if there is no difference between the signals of vessels crossing the direct route bound N. and S. his position would be still further complicated. His only safe procedure in any case would be to get the way off his ship.

In my opinion, whenever the officer in charge of the deck of a steam-ship hears during fog the sound of another steamer's whistle, or a sailing-ship's fog-horn anywhere apparently forward of abeam, he should at once get the way off his own ship, and after the way is entirely off her he should proceed with the greatest caution until he is finally past the danger, and should never, until the approaching vessel is seen, alter the helm under the impression that he can localize the direction and distance of the sound, in which he is almost certain to be deceived.

If these views are accepted by the Committee as correct, there remains for consideration the question as to whether any good is likely to result from having distinctive signals of any kind to intimate the course or direction in which steam-ships are proceeding during fog.

If, as in crowded waters, several steam-ships were approaching one another, not only no good is, in my opinion, likely to arise, but such a system of signalling would give rise to confusion, and if the result of it was to occasion over-confidence in the mind of the officers in charge, and induce them to alter the helm, it would, I think, be distinctly prejudicial to safety.

In more open water, if two steam-ships only were approaching one another at one and the same time, and the officers of both were required to first get the way off their ships, and then one ship was to remain with her engines stopped until the other had passed, as suggested by Captain Wilcox, such an arrangement would, I think, be in the direction of safety.

As, however, such conditions would only apply in a limited number of cases, and those the least dangerous, and could not with safety, in my opinion, be made generally applicable, I am not in favour of altering the present Regulations in this respect.

January 24, 1889.

Paper (D).

Memorandum by Admiral Sir F. L. McClintock.

SOUND-SIGNALS.

Sir, 8, *Atherstone Terrace, London, February* 21, 1889.

Having considered the four points in Lord Stanley of Preston's Minute, I have to report to the International Signals Committee as follows:—

To establish a system of fog-signals to be used by steam-ships during foggy weather to denote the direction in which they are proceeding, if made compulsory, would, in my opinion, rather increase than diminish the danger of collision.

Also, I think it undesirable either to alter the established fog-signal or to add fresh ones.

But I think that the optional use of a few sound-signals might be permitted with advantage.

The use of the signal PD should, I think, be encouraged: it is not liable to be mistaken for any other existing fog-signal, and it would always suggest the most prudent thing to do in a dense fog.

I think that eight course-signals should be established for optional use. There are times in dense fog during still weather, when ships moving slowly would be glad to use their course-signal, in reply to the ordinary prolonged blast.

Mr. Barker's Marine Safety Signal Code, of eight compass signals (No. 9 in the Abstract of Fog-signals) appears to have been most carefully thought out, and it could be adopted without interfering with any of the established sound-signals; it also seems better suited than most others for ready recognition and easy remembrance; for instance—signals beginning with a long sound indicate an eastward course, with a short sound a westward course. It seems probable that two of these signals would soon grow into use in the English Channel, with the outward and homeward bound ships.

(Signed) F. L. McCLINTOCK.

The Secretary,
International Code of Signals Committee.

Paper (E).

Memorandum by Captain C. P. Wilson.

MEMORANDUM ON FURTHER REFERENCE FROM THE BOARD OF TRADE AS TO SOUND-SIGNALS.

Board of Trade Surveyor's Office, St. Katherine Dock House,
Sir, *Tower Hill, February* 20, 1889.

I doubt if, "in the interest of safety, it is desirable to establish a system of sound-signals to be used by steam-vessels during foggy weather to denote the direction in which they are proceeding," on the ground of the very great difficulty of ascertaining the bearing of one vessel from another during foggy weather. It may thus come about that under the supposition a vessel is in a different position from that really occupied by her, manœuvres may be attempted which might actually bring about the collision both are desirous, by their signalling, to avoid.

On the same grounds I also doubt if it is desirable to establish a system of sound-signals to be used by sailing-vessels under like circumstances. If sailing-vessels were liable to meet other sailing-vessels only during foggy weather, I should be disposed to modify these views, but as sailing-vessels are quite as likely to meet steamers as sailing-vessels, I am induced to treat them very much in the same category as to steamers meeting.

In Article 12 of the International Rules for Preventing Collisions at Sea, means are provided for sailing-vessels to indicate approximately the course they are steering, and there is no doubt that with them the direction of the wind is a material assistance in arriving at an approximate estimate of what course each vessel is steering; moreover, time in their case is not so much a factor to be considered, in consequence of foggy weather being generally accompanied by light winds or calms.

In Article 12 falling snow is referred to, when, of course, it is possible a gale of wind may be blowing, but the words of the reference to us mention only "during foggy weather."

I see no reason to draw distinction between sound-signals being limited to crowded waters and narrow seas, or extended to open sea also. In fact, I think that they are quite as likely to be of as much, if not more, use in the open sea, where there is less probability of the signalling of one vessel being confounded with that of another. The main difficulty in establishing a system of sound-signals that presents itself to me is the liability, when a number of vessels are present, of the signals of one vessel being misinterpreted to refer to that of another.

With reference to the various systems that have been proposed from time to time, I think they can be conveniently divided into two categories:—

1. Signals indicating the points of the compass only; and
2. Vocabulary signals.

Signals in the first category do not, I consider, go far enough to make it worth while adopting them, for the reasons given above.

The only vocabulary sytem with which I am acquainted, and that only very slightly, is the Morse system. The advantages attending it are apparently the ease with which it can be used for conversational purposes; secondly, its adaptability to light as well as sound, and to day as well as night, thereby doing away with the necessity of learning a second code; and, thirdly, that it would harmonize with the system in use in Her Majesty's Naval and Military Services. The only objection to it that occurs to me is that it is somewhat complicated, and it is very questionable whether the officers of the mercantile marine would have sufficient leisure to perfect themselves in its use.

On the whole question, I am against the establishment of a system of sound-signals until some invention has been perfected whereby the bearing of one vessel from another during foggy weather can be correctly indicated.

In Article 19 optional sound-signals are provided for indicating the manœuvre a steam-vessel is executing, but as that Article has no reference to foggy weather, I do not think it necessary to refer to it in detail, except to say that I have every reason to believe it is found very useful in practice.

If it is eventually decided that sound-signals are to be adopted for foggy weather, it would be

desirable to make them uniform with Article 19, so that the same signal might be applicable in both clear and foggy weather.

I have, &c.
(Signed) CHARLES P. WILSON.

The Secretary,
International Code of Signals Committee.

Sound-Signals for Use in Fog.

General Summary of Replies.

There have been received from—	Replies.
Masters who are opposed to the introduction of any compulsory system of sound-signals	119
Owners and Societies, ditto, ditto	10
Masters who advocate the adoption of a few simple signals, chiefly those provided by Article 19 of the Regulations for Preventing Collisions at Sea	48
Owners, ditto, ditto	2
Masters who advocate the adoption of more complete systems of signals	28
Seamen's Societies, ditto, ditto	1

The chief reasons given by those who object to the introduction of any system of fog-signals are the confusion they would cause in crowded waters, the difficulty of locating sounds in fog, the false confidence they would give to officers in charge of the vessels using them, and the considerable degree of skill and experience necessary to prevent the possibility of mistake in the event of any complex system being adopted.

Abstract of Observations on the proposed Introduction of a System of Sound-Signals for indicating the Routes or Courses of Steam-ships in Fog, Mist, &c.

1. *London and North-Western Railway.*

Dent, Admiral.—Deprecates any change, but thinks present long blast for S.S. might be continued, followed by one short blast when vessel's head is anywhere from N. to E.; by two between E. and S.; S. and W. three; W. and N. four.

Should not steam-ships with all way off use bells?

Thinks the views of Sir George Nares and Admiral Bowden-Smith might be carried out in a simplified form.

Beaumont, J. A.; and Johns, D., Masters.—Think it would not be advisable.

Taylor, G.; Varian, T. J.; Haldane, A. M.; Clay, T. G.; Thomas, R.; Green, J.; Roche, J. S. N., Masters.—All think the use of sound-signals would greatly increase the risk of collision in crowded channels.

Liddicoat, T.; and Gordon, A., Masters.—Think some simple modification of the present system desirable. Captain Liddicoat approves of the system used in the United States, and Captain Gordon thinks the system suggested by the naval officers and given in the Memorandum much too complicated for the merchant service.

2. Leyland, F., and Co.

Hill, M., Master, steam-ship "Bavarian."—Vessels approaching each other in fog should both stop, and, if necessary, use PD sound-signals until clear of each other.

McConkey, A. E., steam-ship "Persian."—The impossibility of judging from what direction sounds proceed in dense fog would render any compulsory system worse than useless; but in light fog an optional system of eight- or four-point signals, by combinations of long and short blasts, might be useful in open water. In channel work such signals would cause confusion.

Want, W. H., steam-ship "Bostonian."—Compass-signals would cause confusion, but would suggest the general use, in fog as well as clear weather, of the signals specified in Article 19, with one or two modifications.

Parry, E., steam-ship "Venetian."—Thinks the signals under Article 19 sufficient for steamers in fog, and would make no distinction between channels and open sea.

Laurenson, C., steam-ship "Falernian."—Would make the use of Article 19 signals compulsory in fog; any additional signals would cause confusion.

McLay, F. L., Superintendent.—Approves of Admiral Bowden-Smith's suggestions *re* compass-signals.

3. General Steam Navigation Company.

Ellis, J., Marine Superintendent; Dyer, Randall, Joslin, Mallett, Botwright, Cox, Laing, Harding, Wright, Masters.—Are all opposed to any system of sound-signals. Such signals cannot be located in dense fog; they would cause confusion and increase danger by inducing masters to rely upon them, and thus lessen caution in other directions. The signalling appliances of all vessels should be officially inspected.

Great Eastern Railway Company.

Howard, D., Marine Superintendent.—Thinks the present Rules sufficient; numerous sound-signals would cause confusion in narrow channels. There is room for improvement in lights and whistles, and every vessel should show a stern light.

Robinson, J. H.; Gay, W. S.; Henderson, R.; Ablett, J., Masters.—Are all opposed to any change in the present system.

Shedlock, H.; and Henderson, J., Masters.—Are of the same opinion, but the former approves of Mr. Barker's proposal for vessels steering E. to use one long blast, and those steering W. one short one; while Captain Henderson urges a more strict observance of Article 13 by sailing- as well as steam-vessels.

4. Shaw, Savill, and Albion Company.

Shaw, Savill, and Albion Company.—Any system of sound-signals will very greatly increase risk unless it is of the most simple character.

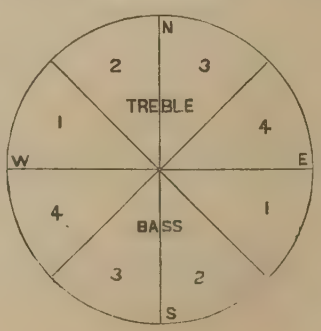
Barlow, B. J., Master.—A system of course- or route-signals is not practicable, because it is impossible for any man to tell within several points from what direction a sound is coming in a fog, and therefore any rule to avoid a danger which you cannot see, and the bearing of which is uncertain, would be most risky; would cause great confusion in crowded channels.

Burton, G., steam-ship "Coptic."—A system of sound (course) signals would lead to confusion; suggests advisability of using Article 19 signals in fog; and the "Direct Sea Route" signals proposed by Sir G. Nares might be useful, and perhaps might also be adopted for entering and leaving port. Suggests use of siren for indicating vicinity, and whistle for indicating measures adopted. The horns of sailing-ships should be more carefully tested than at present.

Marine Superintendent.—Thinks steam-ships should use the fog-signals prescribed by Article 12 for sailing-ships, and that, for the time, they should be assumed to be sailing-ships and signal according to tack and direction of wind. Proposes a number of short blasts as a signal for "engine stopped," that the term "moderate speed" should be defined as one-third the usual speed. Is strongly opposed to any complex system of sound-signals.

5. South-Eastern Railway Company.

Commander Boxer, R.N., Superintendent.—Thinks each steam-ship should carry two swivelled sirens: a high note one on port side to indicate all northern courses, and a low bass to starboard for southern; the various courses being indicated by the number of blasts, one to four, as per diagram, and five for going astern. Sailing-vessels to use horns in same way.



Davies, G., Hammond, F., Kilbee, P., Hall, J., Hammond, J., Harrold, H., and Winton, C., Masters.—All think there should be some system of sound-signals.

6. *London, Brighton, and South Coast Railway Company.*

Their Harbour-master (with many years' sea experience) thinks the present Rules sufficient, and that a system of sound-signals would cause confusion.

Hemmings, H. W., Master.—Thinks if the present signals were strictly used collisions would decrease. Approves of Admiral Bowden-Smith's system if it could be modified to four sounds for compass points.

Sharp, R., Master.—Thinks there should be a system of long and short blast compass-signals.

Breach, C. W., Master.—Thinks course- or route-signals would increase danger, but suggests that vessels on hearing each other might indicate their relative positions by combinations of long and short blasts, speed being reduced until vessels are clear. Approves of Morse system of sound and flash signals.

Hall, J. M., Wade, J., Masters.—Are opposed to any change.

Hartfield, G., Master.—Thinks two minutes between blasts in present Rule too long, and that there might be a specified number of blasts for vessels approaching or leaving land.

Hinton, J., Master.—Thinks two minutes between blasts too long, and that "moderate speed" should be defined.

Aubriot, A., Master.—Does not approve of a system of sound-signals. Thinks term "moderate speed" too vague, and that all vessels should show stern-lights. Sailing-vessels are often very badly lighted.

Sylvestre, L., Master.—Thinks there should be a system of sound-signals. Points out that term "moderate speed" is very indefinite.

Phelipot, L., Master.—Submits similar suggestions to the foregoing.

Phelipot, A., Master.—Thinks "moderate speed" should be defined, and that there should be a system of sound-signals. The lights and whistles of vessels are often inefficient at present, and require supervision.

7. *Ismay, T. H.*

Ismay, T. H.; and Hewitt, Captain, Superintendent.—Additional signals would cause confusion in crowded waters, and increase danger generally by inducing undue confidence in them. All their commanders are opposed to any new system, but one of Article 19 signals might be used for denoting that way is taken off, and a similar signal for reply. Simplicity is a great object.

8. *MacIver, H.*

Thinks the present Regulations, if strictly observed, preferable to any code of signals; but Captain Barker's automatic is the best system he is acquainted with.

9. *Great Western Railway Company.*

Lecky, Captain, Superintendent.—Is opposed to any change in the present simple system. The average master is unfit to work any complex method.

Davies, C., Master.—Thinks the present system sufficient. Approves of the harbour signals in paper (B), but course-signals generally would increase danger.

Pearn, W. L., Master.—Fears that sound-signals would cause confusion, but approves generally of proposals in paper (A). Thinks Article 19 signals might be adopted for fog.

Pearn, T., Master.—Thinks there should be a system for steam-ships, but the present signals are sufficient for sailing-ships. (Submits a detailed statement of suggestions for improving the system proposed by Admiral Bowden-Smith.) The use of Article 19 signals should be made compulsory.

10. *Ship-masters' Society.*

The Committee (and members in port) think any enlarged system of sound-signals would cause great confusion in crowded waters, while its use would require much practice. It is very difficult to locate sounds in fog. They think any system adopted should be universal, and should apply to sailing- as well as steam-vessels, and suggest merely the use of the present optional course-signals in fog, with perhaps PD added. Most masters think "moderate speed" should be defined.

11. *McGregor, J.*

Hutton, J. S., Marine Superintendent.—Thinks the present sound-signals should not be altered, but that sirens are more suitable than whistles for steam-ships, the sound being more penetrating. Bells should be of good metal, and should exceed 16 inches in diameter. A system of compass-signals (diagram submitted) would require fifty-six sounds, and the risk of the confusion would be great.

12. *Holt, Alfred.*

Has consulted other persons whom he thinks competent judges, and finds that opinion generally is against any system of sound-signals; some of them are, however, inclined to support the system proposed by Admiral Bowden-Smith. Mr. Holt is opposed to the adoption of a system.

13. *Cayzer, Irvine, and Co., M.* 8430.

Joss, J.—Is opposed to any system of sound-signals. Thinks signal whistles should be at bows to be more audible from other vessels and to avoid deafening of officers. In sailing-vessels fog-horns are often inadequate, and lights bad and badly placed. Thinks the questions and replies at the head of the paper (C) by Sir Digby Murray cover the whole of the ground, and these replies he thoroughly indorses.

Philp, A. I., Master.—Suggests a system of course (outward, homeward, channel, and coasting) signals, consisting of one, two, and three long blasts; but steam-ships meeting in fog should stop and feel their way cautiously.

Beer, S., Master.—A compulsory system would induce recklessness and also cause confusion, but thinks the system of Admiral Bowden-Smith would often be very useful if it were made optional.

Millar, W., Master.—Thinks the difficulty of locating sounds in fogs would tend to make a system of signals dangerous.

, Master of "Clan Graham."—Submits a system of course-signals to be made by means of blasts upon the siren and steam-whistle.

Harrison, N., Master.—His views on the matter coincide very much with those expressed by Sir D. Murray, Admiral Sir F. McClintock, and Captain C. P. Wilson. Is opposed to any compulsory system, but thinks Admiral Bowden-Smith's code, with certain modifications, might be made optional.

Rule, W. I., Master.—Thinks a few simple signals might be introduced, to be added to if found to work satisfactorily.

14. *Wilson, T., Sons, and Co.*

Rutter, J., Superintendent.—Thinks a system of sound-signals would be an element of great danger.

Worth, W. G., Master.—Sound-signals are impracticable on account of the difficulty of locating them. The sirens now used cause confusion when near light-ships.

Scarr, G., Master.—A system of signals would increase danger. Present system is sufficient, but it is very desirable that all whistles should be of a uniform pattern.

Wilson, R., Master.—Would merely impose a system, already often used, of one blast for going ahead, two for stopped, and three going astern.

Pepper, G., Master.—Thinks Article 19 signals with PD added would be sufficient. Any extensive code would increase danger.

Vickerman, W., Master.—A system of sound-signals would increase danger owing to the confusion that would arise in crowded channels, and the difficulty of locating sounds in fog.

Irvin, T. M., Master.—Thinks all steam-ships should be compelled to have uniform whistles, quite distinct from the light-ship sirens they now often resemble. Nothing more than Article 19 signals is required for use in fog, and these might be adopted.

15. *Leyland, R. W.*

Entirely agrees with Sir D. Murray's objections to sound-signals, but thinks vessels should carry lights arranged as helm indicators.

Richardson, N., Master.—A change in the present system would lead to danger. The horns of sailing-ships should be more powerful.

16. *McIver, D., and Co.*

Billinge, E., Master.—Whistles and horns should be more powerful than at present. Article 19 signals, with slight alterations, might be used in fog. Systems in papers (A) and (B) are too elaborate and quite unfit for use in the merchant service.

Gill, Master.—Thinks it important to have a few simple signals to denote up, down, and crossing English and Irish Channels.

McConochie, J., Master.—Agrees with Sir D. Murray and Admiral Sir F. L. McClintock as to the undesirability of establishing a code of sound-signals. Would encourage the use of PD, but believes route-signals would only increase danger.

17. *Guion and Co.*

Munder, G. S., Master.—Sound-signals for fog are impracticable owing to the difficulty of locating them, and the confusion they would cause in crowded channels. Slow speed and caution are necessary when two vessels hear each other, and optional use of Article 19 signals sometimes advantageous. To stop is very undesirable, as steam blows off and drowns all sound. Suggests short blasts, blown continuously, as a distress signal.

Worrall, J. P., Master.—Sound-signals would cause confusion. Thinks "moderate speed" (Article 13) should be defined as not exceeding 9 knots.

Cushing, J. A., Master.—Course- or route-signals would cause confusion, but approves of American code, *i.e.*, one blast for "my course is to starboard," two "to port," three "full speed astern," with another signal for "way off" and "stopped." Whistles and horns should be increased in power, and speed reduced in fog.

Brooks, S., Master.—Compass-signals much too complicated; would merely have one blast for port helm and two for starboard. Whistles should be required to be efficient, and "moderate speed" should not exceed 8 knots.

Rigby, C. L., Master.—Entirely advocates the American system, but to render it effective some powerful, clear-sounding instrument must be approved and universally used. Simplicity is the chief point, as prompt action is so necessary.

18. *Kiddle, Captain.*

Sound-signalling impracticable on account of existing general inability to distinguish notes.

19. *Glover Brothers.*

Buchanan, J., Master.—Would not alter the present signals, but would provide five optional ones —viz., PD, and (4) North, South, East, and West—signals by combinations of long and short blasts.

Rainey, A. G., Master.—Approves of Admiral Bowden-Smith's suggestions; also thinks Article 19 signals and PD might be used, but there is much difficulty in locating sounds, especially near high land, which produces echoes. High speed in fog is now a great source of danger. Would not alter sailing-ship signals.

Glover, Terrot, Master.—Thinks it impossible for the average ship-master to devote the time, or acquire the prompt accuracy, necessary for the successful working of a complete sound-signal system. To establish such a system would be to induce more reckless navigation and thus increase danger.

Glover, Thomas, Master.—Thinks what is chiefly required is a definite system for indicating the position of the helm by siren-signals; the main cause of collisions being uncertainty on this point when vessels are nearing each other.

20. *McGregor, Son, and Co.*

Taylor, A., Master.—Is strongly opposed to any alteration, both on account of the utter confusion a sound-signal system would cause in crowded channels, and the difficulty of locating sounds. Would make it criminal to exceed 4 knots in fog. The only safe course for approaching vessels in fog is to slow down and feel their way. Entirely agrees with the reasons given by Sir D. Murray for not having the present Regulations altered.

Duke, W. E., Master.—Would make the use of Article 19 signals, with P D added, compulsory in fog.

21. *Peninsular and Oriental Steam Navigation Company.*

Their Nautical Committee, composed of Lord Sudeley, Director; Captain W. E. Angrove, Marine Superintendent; and Captain J. E. Almond, Nautical Inspector, are strongly convinced that any elaborate system would increase danger, as the exactness necessary for working it is not to be found on board the lower class of merchant-ships. Would simply add P D to present signals. Captain Almond calls special attention to the difficulty of locating sounds and measuring their length.

Tomlin, Barratt, Orman, Reeves, Fraser, Worcester, Stead, Adamson, Loggin, Edwardes, Stewart, Andrews, Harvey, and Angrove, Masters.—All oppose the introduction of any code of sound-signals, chiefly on account of the difficulty of locating sounds in fog and the risk of confusion. Attention is called to the vagueness of the term "moderate speed" by Captain Loggin and Captain Fraser: and Captain Edwardes thinks if Article 19 signals were optional they might be useful when only two steamers were in proximity. Captain Orman remarks that if a vessel had sounded a compass-signal and then had to alter her helm confusion would arise, but he agrees with Sir D. Murray and Sir F. L. McClintock in recommending PD.

Wyatt, Captain.—Approves Admiral Bowden-Smith's suggestions, subject to certain modifications. Present position of whistle is a bad one, as it deafens officer on bridge. Whistle should be at foremast-head.

22. *National Steam-ship Company.*

Their captains do not think it practicable to introduce a system of sound-signals. What is required is to regulate the speed of steam-ships in fog; also more powerful fog-horns for sailing-ships.

23. *Watts, Ward, and Co.*

Graystone, S., Master.—Thinks Rules for fog should allow considerable latitude, and that any code system would cause confusion in crowded waters. Signals should be more powerful.

Valder, R., Master.—Thinks present signals sufficient. It is difficult to locate sound in fog, and a system useful on the ocean might be confusing on English coasts.

Scott, M., Master.—Agrees with foregoing, but suggests four long blasts to indicate "stopped," and five for reply "understood," to be used by two steam-ships when in proximity.

Cox, R. M., Master.—A code would induce false confidence and cause confusion. It is difficult to locate sounds in fog, and difficult in time of anxiety to estimate their duration.

Raeburn, J., Master.—Approves of the compass-signals suggested in paper (A), the port signals in paper (B), and PD signal; any complicated system would cause confusion; all signals should produce uniform sounds. The term "moderate speed" in Article 13 is too vague.

24. *Fenwick, J., and Son.*

Sound-signals would increase danger, especially in crowded water.

Scott, W., Master.—Would extend Article 12 (*a*) by requiring approaching steam-ships to stop and indicate their intended course.

Brown, W. B., Master.—Stern-lights should always be shown, and use of siren prohibited, on account of its similarity to lighthouse-signals.

Watson, J. S.; Munroe, A.; and Hodden, G., Masters.—A system of signals would only cause confusion.

Geary, W., Master.—Stern-light should be made compulsory, and use of siren prohibited. Whistles and horns should be of the best; approaching steam-ships should get their way off and pass cautiously. Present Rules are simple, and this is a great advantage.

25. *London and South-Western Railway Company.*

Edom, F.; Merrett, T.; Mortimer, H. D.; Nutbeem, G. N.; Vanderplank, C.; Dyer, J.; Lainson, T.; Gregory, W.; Bishop, W.; Mabb, R. C.; Heathcote, R., Masters.—Are opposed to the introduction of any system, chiefly on account of the risk of confusion. Five of the foregoing advocate the PD signal, and two call attention to vagueness of term "moderate speed."

Allix, G., Master.—Advocates an eight-course compass-signal, also signal PD. Fog-horns should be more powerful than at present.

Kemp, F. E., Master.—Would make the use of Article 19 signals compulsory in fog.

Lewis, G. H., Master.—The Morse, or some other suitable system, should be used by steam-ships everywhere, but no change necessary for sailing-ships.

26. *Eastern Steam-ship Company.*

Westray and Co.—Would introduce no change except use of PD, and two signals for "up" and "down" rivers; a sound-signal system would cause confusion, induce undue confidence, be difficult to remember, and would render the law concerning navigation very uncertain.

Long, D. C.; Prentice, W. L.; Cox, J. S.; and Scott, T., Masters.—Are opposed to the introduction of any system, chiefly on account of the risk of confusion. Captain Prentice approves of PD, and Captain Cox thinks whistles and horns generally should be improved. Captain Scott says the working of a system would absorb attention to a dangerous extent.

27. *British India Steam Navigation Company.*

Smith, J., Master.—Approves of the eight-point course-signals of Admiral Bowden-Smith. These are simple, and would not cause confusion. Sees no risk of inducing over-confidence, and the difficulty sometimes experienced in locating sound is no real objection.

Avern, I., Master.—Also approves of the eight-point course-signals.

Hutchinson, W. E., Master.—It is difficult to locate sound in fog, and additional signals would only increase risk. If any adopted, they should be course-indicating, and very simple.

Sayers, N. R., Master.—Fully agrees with Sir D. Murray that present Rules should not be altered. Sound-signals would cause confusion.

Hodgkinson, G.—Thinks there should be a voluntary system for steam-ships, and approves of that of Admiral Bowden-Smith. For sailing-ships a signal for indicating the direction of the wind, when abaft the beam, is all that is required.

28. *Irish Steam-ship Association.*

A system of sound-signals would increase danger.

29. *City of Dublin Steam Packet Company.*

Kendall, T. G.; Thomas, J.; Thomson, T.; Chittick, J.; O'Neill, D., Masters; and Watson, W., Superintendent.—Are all opposed to the adoption of a system of sound-signals. The objections are the risk of confusion and the difficulty of locating sounds in fog. Captains Kendall and Thomas think the PD signal might be useful.

30. *Allan Line of Steam-ships.*

Dunlop, N.—Is opposed to any elaborate system of signals, but whistles, &c., should be required to be of sufficient power.

Macnicol, A., Master.—Would merely adopt PD, and increase the power of horns and whistles; a signal system would cause confusion.

Hughes, R., Master.—A course-indicating system is impracticable, but the urgent signals on p. 4 of Memorandum might be adopted, with a signal for reply "understood;" a signal for "not moving" is also required.

Wylie, H., Master.—No additional signals required, but suggests substitution of gong for the bell, as being more penetrating.

Menzies, C. J., Master.—Compass-signals would cause confusion, but approves of Captain Crofton's system. Whistles should be uniform, low tone for ocean—and shrill for coast—trade; one blast for one direction, and two for opposite. Two steam-ships, when approaching, should both slow.

Killop, D. M., Master.—Indorses the opinion of Sir D. Murray and Sir F. L. McClintock, and is opposed to any system of signals, but an optional signal for "up" and "down" channel might be useful.

Stephen, J. G., Master.—Sound-signals would cause confusion. Steam-ships which have had to stop in fog should sound three blasts every two minutes.

Carruthers, R., Master.—Is opposed to the introduction of any system.

Moore, R. P., Master.—Present system is quite sufficient, but advocates use of PD.

Richardson, W., Master.—It is impossible to locate sounds in fog, and any system would cause confusion. Thinks present American system might be extended by adopting three blasts for "stopped," and four for "going astern."

France, J., Master.—A sound-signal system would cause great confusion, and increase collisions. Present signals sufficient.

Dunlop, W., Master.—Does not think any new system necesssary, but approves of PD. There should be a standard minimum of power fixed for whistles.

Watts, R. S., Master.—Few whistles can give sounds uniformly, and it is difficult to estimate duration or direction of sounds. Moreover, a system of signals would induce less careful navigation.

31. *Temperley, Carter, and Darke.*

Think course-signals would increase danger, owing to the difficulty of locating sounds in fog, and the confusion that would arise in crowded waters. Moderate speed should be defined, say, 5 miles per hour.

Jackson, J. E., Master.—Thinks a concise system by means of long and short blasts would be useful for steam-ships, but no change necessary for sailing-ships. The risk of collision will not, however, be lessened unless a strict Rule is made that steam-ships shall not exceed, say, 6 knots in fog. Under present system masters are compelled to run at high speeds, and officers generally are overworked by frequent watches. Steam-whistles should be aloft, as they deafen officers on bridge, and drown signals of other vessels.

32. *Royal Mail Steam Packet Company.*

Armstrong, B. G., Master.—Is opposed to any system, as it is difficult to locate sounds in fog. Slow speed and caution the best safeguards. Present horns of sailing-ships are sufficient.

Dickinson, L. R., Master.—Fully agrees with the proposal of Admiral Sir F. McClintock for allowing the use of a few optional signals, and would reduce the interval for the compulsory Article 12 (*a*) signal to one minute.

Woolward, A., Master.—The variety and uncertainty of the sounds produced by whistles would make any system dangerous.

Gillies, A., Master.—Course-signals would be confusing and dangerous in crowded channels, but useful in the open sea. Article 12 signals should be blown once every minute, and vessels in thick fog should be compelled to stop and blow PD at one-minute intervals.

Brander, J., Master.—Quite agrees with Sir D. Murray and Captain Wilson that a sound-signal system would cause confusion and danger owing to the difficulty of locating sounds; and does not advocate optional signals. Vessels should be compelled to stop dead in fog, &c., only moving to avoid danger.

Gillies, W., Master.—Thinks all vessels should stop in fog, moving only to avoid danger, and then sounding—steam-ships, four whistles of four seconds each, and sailing-ships four similar blasts on fog-horns. But if a moderate speed in fog is allowed, a system of helm and tack indicating signals might be allowed. For steam-ships one blast = "port," two blasts = "starboard," three blasts = "going astern;" and the same for two respective tacks of sailing-ships, with four blasts for "no steerage way," and three for "wind free."

33. *Hall Brothers.*

Steele, J. B., Master.—Would make the use of Article 19 signals compulsory, but otherwise any alteration is unadvisable. Unless thoroughly understood, a sound-signal system would increase danger. Caution is the chief safeguard.

Innes, G., Master.—Would only adopt PD. Any general system would cause great confusion in crowded waters. Sailing-ships often proceed at an 8 to 10 knot speed in fog, and this is a great source of danger.

Aikman, J., Master.—Is opposed to any system of signals on account of the difficulty of locating sounds in fog, the risk of confusion, and of inducing false confidence. Would only adopt Article 19 signals, and make their use general in all waters. All whistles and horns should be inspected; the latter are often very defective.

Carpenter, I. T., Master.—Agrees with Sir D. Murray's objections. Some of the systems proposed would cause great confusion, and could not be carried out with the appliances now in use. PD would be useful. Whistles and horns should be improved and made uniform. Calls attention to the necessity for fixing sailing routes, and to the confusion now caused by the practice of continuously showing a stern-light on board steam-ships.

Hunter, T., Master.—Instead of the present inefficient horns and whistles there should be carried two of each (one high and one low note), the high to be sounded for courses from S.S.W. to N.N.W., the low from N.N.E. to S.S.E., and combinations of high and low for other courses.

Rogers, C., Master.—The systems described in papers (A) and (B) would cause a Babel of sounds in crowded waters. He would only make the use of Article 19 signals compulsory in fog, with four blasts for "stopped" added. Speed in fog should be limited to 3 knots, and sound-signals more powerful.

Satterly, I. T., Master.—Steam-ships should use a siren on outward, and a whistle on homeward, voyage. Any detailed code would be unworkable, as sounds are very imperfectly heard to windward, and if one blast of a code-signal were missed a collision might result. Present sailing-ship signals are sufficient.

Smith, A. R., Master.—Course- or route-signals would cause confusion. Present signals with PD added are sufficient.

Lowrie, W., Master.—All signals should be larger and more effective, and an additional bell should

be carried in the stern of vessels over 300 feet long. Reduced speed should be defined, and copies of rules, &c., *re* road and signals posted in chart-rooms.

34. *British Ship-masters' Association (Hull).*

Any great alteration would cause confusion. They would simply make the use of Article 19 signals compulsory in fog, with one long blast added for "going slowly ahead." Also approve of PD. Sirens should be prohibited on board steam-ships, as their use leads to confusion. All whistles should be uniform. Caution is the chief safeguard in fog.

35. *Henderson Brothers.*

Hedderwick, J., Master.—Thinks an elaborate system could not be worked with certainty, as it is difficult to locate sounds, and confusion and misunderstandings would arise, whilst speed would be increased. Would merely utilize Article 19 signals for fog, &c. These would in some degree conduce to safety.

Young, H., Master.—Thinks Article 19 signals and PD sufficient, and that any general system would cause confusion. The only safe course on hearing a steam signal ahead in fog is to stop. The interval between the blasts (Article 12 (*a*)) should be reduced from 2 minutes to 30 seconds.

Craig, J., Master.—Sir D. Murray's paper (C) fully meets his views. It is difficult to locate sounds in fog, and a code of signals would cause confusion. The insufficient power of the horns of sailing-ships is the greatest source of danger.

Harris, J., Master.—A system of compass-signals would cause confusion. The two first of Article 19 signals should be made compulsory, and when two steam-ships are meeting, the first to signal "port" or "starboard" should hold the course signalled, the other being bound to steer accordingly or stop. All sailing-ships should have equally powerful horns.

Wilson, J., Master.—Any elaborate system would cause confusion, but Article 19 signals might be used as they are at present in America. The power of whistles should be increased, some being inaudible except at short distances.

McFee, R., Master.—Compass-signals would cause confusion, but all steam-ships should use the siren or graduated whistle, and sound a series of howls for port helm and of toots for starboard. Three long blasts to be used when overtaken or for going astern.

36. *Scottish Ship-masters' Association.*

Braes, Master (State Line).—Any elaborate system would cause confusion. Would merely legalize use of Article 19 signals, with PD added, in fog. Vessels approaching each other in fog should be compelled to stop and feel their way.

Lindquister, Master.—All steam-ships should carry sirens and make long howls for starboard, and series of toots for port, courses in fog, with distinct three-blast signals for "going astern" and "stopped." But these signals should be optional, as their compulsory use would cause confusion in crowded channels. Is opposed to any system of course- or route-signals.

Renfrew, Master.—Any compulsory system would increase danger. Would merely add PD, and increase the power of whistles, &c.

Howling, Master.—Many of the suggested systems made would lead to utter confusion. Would merely adopt (permissively) Article 19 signals with PD added, and improve the power of whistles, &c.

Parker, R., Master.—Expresses similar views to the foregoing, except that he would adopt only the three-blast (Article 19) signal and PD for fog.

White, H., Master.—Would merely adopt Article 19 signals and PD for use in fog. Anything more would increase danger in crowded waters.

37. *Amalgamated British Seamen's Protection Society.*

Advocate the adoption of Mr. Jeffries' eight-course signal system, consisting of combination of long and short blasts with two seconds intervals.

38. *Dublin Local Marine Board.*

Do not advocate any code of fog-signals, but think it would be well if a signal could be provided to indicate which of two meeting ships should stop and allow the other to proceed.

Cunard. *M.* 15648.

No change. Advise the adoption of signal PD. Difficult to hear fog-horns. They are not loud enough.

Appendix (C).

Report of Committee on Sound-Signals.

Experiments made in Holland about Force and Duration of a Sound-Signal, by M. Lefèbre

A STEAM-WHISTLE of 2 inches in diameter requires a pressure of about two atmospheres in order to make the sound heard at the distance of 1 kilom. ($\frac{5}{9}$ of a knot), whereas a steam-whistle of 6 inches in diameter with a pressure of six atmospheres makes its sound heard at a distance of 14 kilom. (about 7 miles). If, however, the whistle be placed in a horizontal position within a reflector, the 2-inch whistle can be heard at 4 kilom. (2·2 miles), which is about the same as the distance at which the side-lights throw their lights.

As a fixed reflector might be considered against the Rules, the apparatus might be made to revolve. The arrangement to effect this is very simple.

Another theory of his is that a sound wants at least from six to eight seconds to enable it to be heard; consequently, the duration of the sound or blast should not be fixed at a less minimum. It may be that the meaning is the first sound or blast ought to have this duration to well attract the attention.

With regard to the weights in the bellows, he states that an instrument with a pressure of 11 lbs., placed in a nearly horizontal position, and provided with a suitable reflector, can be heard at a distance of 4 kilom. (2·2 miles), and with a pressure of 18 lbs., at a distance of 14 kilom. (about 7 miles). In order to distinguish between steam-ships and sailing-vessels, all steam-whistles should produce the same tone, and all fog-horns also the same tone, but a little higher. By comparing the sound heard with the sound of the instrument on board one's own ship, it will be easy to ascertain whether a steam-ship or sailing-vessel is approaching.

In case it should be deemed advisable to distinguish between signals from the shore or from a ship, either the ship or the shore might be required to produce a double sound simultaneously.

With a bell of 8 inches, as now generally in use, the sound travels only as far as 600 metres ($\frac{1}{3}$ of a mile), and it requires a bell of a weight of 80 kilog. to transmit the sound at a distance of 1,500 metres ($\frac{5}{6}$ of a mile).

The sound of a movable bell (*i.e.*, when the tongue or clapper is fixed) travels farther than when the reverse is the case.

Appendix (D) to Report of Committee on Sound-Signals.

Order of Reference to the Committee.

At the Council Chamber, Whitehall, this 20th day of December, 1887.

Present:

The Right Hon. Lord Stanley of Preston, G.C.B., &c.

THE Board of Trade are pleased to appoint the following gentlemen, viz.:—

Thomas Gray, Esq, C.B., Assistant Secretary, Marine Department, Board of Trade (Chairman);
Captain H. M. Hozier, Secretary to Lloyd's;
*Robert Jackson, Esq., Registrar-General of Shipping and Seamen;
Admiral Sir F. L. McClintock, F.R.S., an Elder Brother of the Trinity House;
Sir Digby Murray, Bart., one of the Professional Officers of the Board of Trade;
Rear-Admiral Sir George S. Nares, R.N., K.C.B, one of the Professional Officers of the Board of Trade;
†Captain Bowden-Smith, R.N.;
Captain C. P. Wilson, I.N., Principal Officer of the Board of Trade for the London District;

to be a Committee to undertake and to report upon the following matters, viz.:—

1. To bring the International Signal Book up to date.
2. To report whether the time has arrived when it may be deemed desirable to establish a system whereby the signals in the International Code Book may be made by night as well as by day.
3. To report whether there is a general demand on the part of the mercantile marine for such a system, and, if so, what system should be adopted.
4. To report (if a system whereby the signals in the International Code Book could be made at night were established) whether any danger is likely to arise therefrom owing to the inducement it might afford to ships to approach one another closely at night for the purpose of signalling.
5. To report whether there ought to be any, and, if so, what, restrictions on the use of night signals, especially in crowded waters, as, for instance, the English and Irish Channels.
6. If the Committee do not recommend the establishment of any general system of night signals,

* Since resigned. † Now Rear-Admiral.

to report whether it is, in their opinion, desirable (in addition to the present distress signals) to establish some special warning signals to indicate danger to passing vessels, *e.g.* :—

"I am in need of immediate assistance,"
"You are standing into danger,"
"I have encountered ice,"
"I have passed a derelict dangerous to navigation,"

or any other warning signals in the interest of safety; and, if so, what those signals should, in their opinion, be, and by what means they should be made.

The Board of Trade are also pleased to appoint Walter J. Howell, Esq., to be Secretary to the Committee.

(Signed) STANLEY OF PRESTON.

INTERIM REPORT TO THE SECRETARY OF THE BOARD OF TRADE.

Sir, 7, *Whitehall Gardens, London, January* 15, 1889.

In compliance with the request of the late President of the Board of Trade, Lord Stanley of Preston, we have carefully considered the matters referred to us by his Lordship's Minute of Reference of the 20th December last (of which a copy is prefixed), and we have now the honour to submit our *interim* Report upon the two salient points covered by the same, viz. :—

1. *The Revision of the Signal Book.*

In order to take effective steps to bring the International Signal Book up to date, three of our number, viz., Sir Digby Murray, Sir George Nares, and Admiral Bowden-Smith, were deputed to be a Sub-Committee to undertake this duty, with the assistance of Captain Key, R.N., of the Board of Trade London Staff. A revised copy of the book,* showing in detail the alterations proposed, is submitted herewith (marked A), together with a short explanatory Memorandum (marked B), prepared by Admiral Bowden-Smith, in order to indicate clearly the nature of the changes suggested for the improvement of the arrangement of the book, and for bringing it up to date.

We have set out the signals of distress by themselves in an inclosure (marked C), and also nine important urgent signals, in an inclosure (marked D).

We have rearranged important two-flag signals, as shown in an inclosure (marked E).

These will all be printed in a permanent place at the beginning of the Signal Book in the order in which we have given them.

We are unanimously of opinion that the alterations and additions we propose will, if adopted, materially increase the usefulness of the Signal Book. It will, however, be necessary to invite and consider the opinions of foreign and Colonial Governments on the subject, and, with that object in view, we think that the book should be set up in type in its revised form, and we suggest that a copy should be sent to the Government of each Maritime State for its concurrence before any further steps are taken in the matter. When replies have been received from the several foreign and Colonial Governments, we propose to again meet in order to consider any representations that may be made, and to prepare and submit our Final Report for your consideration.

2. *The question of Night Signalling.*

We have taken steps to ascertain whether there is a general demand on the part of the mercantile marine for the establishment of some system whereby the signals in the International Code Book may be made by night as well as by day. A copy of a letter of inquiry, issued by our directions (together with a summary of the replies received to the same), is appended (marked F).

So far as we have been able to ascertain at present, there appears to be no general demand on the part of the mercantile marine for the establishment of a general system of night signalling. At the same time, we think it advisable to adopt some plan by which a few urgent and important signals may be made by night as well as by day. The signals we have selected for this purpose are shown in the accompanying paper (marked D).

These signals may be made at night or during fog, either by flashes of white light or by a combination of long and short sounds on the steam-whistle, fog-horn, siren, bugle, &c. In the daytime they will be made by flags. The methods of making these signals are shown in detail in Inclosure (D).

Since the date of Lord Stanley of Preston's Minute of Reference the Board of Trade have requested us also to consider and report upon the following points:—

"Whether, in the interests of safety, it is desirable to establish a system of sound-signals to be used by steam-vessels during foggy weather to denote the direction in which they are proceeding."

"Whether, on the same grounds and for the same purpose, it is necessary to establish a system of sound-signals to be used by sailing-vessels under like circumstances."

"Whether such system should be limited to crowded waters and narrow seas near coasts, or whether it should he extended to the open seas also."

"If any system is deemed by the Committee to be practical, what that system is."

* The revised book is at present at the Board of Trade.

These matters will accordingly receive our careful consideration, and will be referred to in our Final Report.

We have, &c.

(Signed) THOMAS GRAY, *Chairman.*

F. L. McCLINTOCK.
D. MURRAY.
G. S. NARES.
N. BOWDEN-SMITH.
CHARLES P. WILSON.

(Signed) WALTER J. HOWELL,
Secretary.

To the Secretary,
Board of Trade.

Inclosure (A).

The Revised Signal Book (at present at the Board of Trade).

Inclosure (B).

Memorandum by Admiral N. Bowden-Smith, showing the Changes proposed for the Improvement of the Arrangement of the Signal Book, and for bringing it up to date.

1. It is proposed that the British national colours should be omitted from the place they now occupy opposite the title-page, and that certain signal-flags shown in the book should be printed in that position.

2. That the "Contents" and "Introduction" should be corrected in accordance with the changes made, and that a few notes shown in an inclosure (marked E) should be inserted against the Report of the Committee of July 1855.

3. That as the national colours printed after p. xvi are incomplete, a new and corrected set of colours should be prepared, and that where the colours worn by merchant-ships differ from those worn by men-of-war both flags should be shown.

4. That the selection of sentences for the use of vessels, &c., should be omitted from the page preceding the general signals; that the distress signals should be printed in conspicuous type at the top of that page, and that the signals for a pilot should be printed under them on the same page.

5. It is also proposed that the two-flag signals should be regrouped and considerably extended; that they should be headed "Urgent and Important Signals," and that NC should be placed in the first group as well as in its proper position. Also that where a signal is repeated (such as VL under "Boats") it should be printed in italics. It is further suggested that a few signals should be introduced which could be made at night or during fog, so that if at any future time it should be considered desirable to introduce a system of night signalling, this may be done without necessitating a further revision of the Code signals.

6. That the three-flag signals should be revised and several new ones added relating to cargo, convoy, diver, interpreter, telegraph cable, torpedoes, &c. The obsolete nationalities at p. 12 and following pages should be omitted, and the names of other Powers substituted as indicated.

Section VII, p. 38, relating to boilers and machinery, should be considerably altered as shown, and it is proposed that the Table of current coins, &c., now printed at p. 69, should in future follow p. 72, and that in view of the difficulty of keeping the equivalent values correct, they should in future be omitted from the Table.

7. That one geographical list (arranged alphabetically), as reprinted, should be inserted at the end of Part I of the Signal Book, and that the second list, at p. 173 (Part II) should be abolished.

8. That the four-flag signals under "Vocabulary," in Part II, should be amended throughout, and that several important words hitherto omitted should be inserted, as indicated throughout the list.

9. That new significations should be adopted for distant signals, as indicated at p. 206, Part III.

10. That the book should be paged consecutively from beginning to end, instead of commencing again at Part II, and that if advertisements are inserted at all, in future they should all be printed at the end of the volume, instead of at both ends, as at present.

11. That the names of the men-of-war of the leading Maritime States to which symbols have been assigned should be printed in future in the Code list bound up at the end of the Signal Book.

Inclosure (C).

DISTRESS SIGNALS.

The following signals are alone deemed to be signals of distress :—

In the daytime.—The following signals, numbered 1, 2, and 3, when used or displayed together or separately, shall be deemed to be signals of distress in the daytime :

1. A gun fired at intervals of about a minute ;
2. The International Code signal of distress, indicated by NC ;
3. The distant signal, consisting of a square flag, having either above or below it a ball, or anything resembling a ball.

At night.—The following signals, numbered 1, 2, and 3, when used or displayed together or separately, shall be deemed to be signals of distress at night :

1. A gun fired at intervals of about a minute ;
2. Flames on the ship (as from a burning tar-barrel, oil-barrel, &c.) ;
3. Rockets or shells, of any colour or description, fired one at a time, at short intervals.

NOTE.—It will be seen that we have also provided that the signal NC may be made during day or night by a rocket or shell which bursts in the air with a loud report.

PILOT SIGNALS.

TO BE MADE BY SHIPS WANTING A PILOT.

In the daytime.—The following signals, numbered 1 and 2, when used or dislayed together or separately, shall be deemed to be signals for a pilot in the daytime, viz. :—

1. To be hoisted at the fore, the Jack, or national colour, usually worn by merchant-ships, having round it a white border, one-fifth of the breadth of the flag ; or
2. The International Code pilotage signal indicated by PT.

At night.—The following signals, numbered 1 and 2, when used or displayed together, or separately, shall be deemed to be signals for a pilot at night, viz. :—

1. The pyrotechnic light commonly known as a blue light, every fifteen minutes ; or
2. A bright white light, flashed or shown at short or frequent intervals just above the bulwarks for about a minute at a time.

Inclosure (D)

URGENT OR IMPORTANT SIGNALS which may be made at Night or during Fog, either by flashes of White Light or by a combination of long and short sounds on the Steam-whistle, Fog-horn, Siren, Bugle, &c. In the daytime they will be made by Flags.

Instructions for the Use of Flashing or Sound Signals.

(1.)

With flashing signals the lamp must always be turned towards the person addressed.

(2.)

To attract attention, a series of rapid short flashes or sounds should be made and continued until the person addressed gives the sign of attention by doing the same.

If, however, it is supposed that the person addressed cannot reply, the signal may be made after a moderate pause, or, under certain circumstances, the communication may be made direct without preparatory signs.

(3.)

After making a few rapid short flashes or sounds as an acknowledgment, the receiver must watch, or listen attentively until the communication is completed, when he must make the sign indicated below, showing that the message is understood.

(4.)

If the receiver does not understand the message, he must wait until the signal is repeated.

(5.)

Duration of short flashes or sounds	1 second.
„ long „ „	3 seconds.
Interval between each flash or sound	1 second.
Answer, or "I understand" ... ... — - — - — - — -	&c.

Signals.

NP	I want assistance. Please remain by me	- —
JK	You are standing into danger	- - —
PG	Beware of derelict, dangerous to navigation	- - - —
QC	Have encountered ice	- — —
PD	The way is off my ship, you may feel your way past me ...	- — -
JB	Stop, or heave to; I have something important to communicate ...	- — - -
PR	Am disabled. Communicate with me	- — -

When a vessel is in "tow," the following flashes or sounds may be made from her to the tug or towing vessel:—

KR	Steer more to port	- -
KS	Steer more to starboard	-

Inclosure (E).

URGENT OR IMPORTANT SIGNALS.

(To be made by two Flags.)

Note.—NC should only be hoisted when vessel is in extreme danger (*see* "Merchant Shipping Act, 1873," section 18.)

ASSISTANCE.

NC	IN DISTRESS. WANT IMMEDIATE ASSISTANCE.
	(*This Signal may also be made by day and by night with a rocket or shell which bursts in the air with a loud report.*)
HB	Vessel indicated wants immediate assistance
HC	No assistance can be rendered.
HD	We are coming to your assistance.
HF	Am on shore. Likely to break up. Require immediate assistance.
HG	Do you require further assistance?
HJ	Do not require further assistance. (*See* WANTS.)

BOATS.

HK	Send a boat.
HL	No boat or boats available.
HM	Boat in distress, adrift, or capsized.
HN	Do not attempt to land in your own boats.
HP	I am sinking, or on fire; send all available boats to save passengers and crew.
HQ	Send life-boat to save crew.
HR	Boat is going to you.
VL	*Want or wants boat or boats immediately.*

COMMUNICATE.

HS	Close.
HT	Allow no person on board. Allow no communication.
HV	Be very careful in your intercourse with strangers.
HW	Open, or "Proceed on your voyage."
JB	Stop, or heave to; I have something important to communicate.

DAMAGE OR ACCIDENT.

JC	Damaged or sprung mast; cannot carry sail.
JD	Damaged rudder; cannot steer.
JF	Have lost all boats. Can you take crew off?
JG	Accident; want a surgeon.
JH	Man overboard. (*See* DISABLED STEAMER.)

DANGER OR CAUTION.

JK	You are standing into danger.
JL	You are in a dangerous or unsafe position.
JM	You are within reach of the guns, or of batteries.
JN	The attempt is dangerous.
JP	Appearances are threatening; be on your guard.
JQ	Stranger (*or vessel indicated*) is suspicious.
JR	Bar is impassable.
JS	Have obtained soundings.
JT	Am aground.

DIRECTIONS TO A VESSEL UNDER WAY.

JV	Stand off; get an offing.
JW	Tack instantly.
KB	Increase speed. Make more sail.
KC	Stop engines. Heave to.
KD	Go astern. Heave all aback.
KF	Reduce speed. Shorten sail.
KG	Stand on.
KH	Bear up instantly.
KJ	Wear instantly.
KL	Not room to wear.
KM	Heave to, head off shore.
KN	Haul your wind on starboard tack.
KP	Haul your wind on port tack.
KQ	Keep to windward.
KR	Steer more to port. (*To be kept flying until course is sufficiently altered.*)
KS	Steer more to starboard. (*Ditto.*)
KT	Steady the helm.
KV	Steer after me.
KW	Steer course indicated.
LB	Channel dangerous without a pilot.
LC	Buoys or marks are not in their proper position.
LD	Leave the buoy or beacon to port.
LF	Leave the buoy or beacon to starboard.
LG	Keep on the port shore or side of channel.
LH	Keep on the starboard shore or side of channel.
LJ	Keep in the centre of channel.
LK	Do not anchor on any account.
LM	Do not come into less than —— feet.
LN	Run on the beach. Beach the vessel where flag is waved or light shown.
LP	Anchor instantly.
LQ	Anchor as convenient.

DIRECTIONS TO A VESSEL AT ANCHOR.

LR Hoist the Blue Peter.
LS Get steam up (report when ready).
LT Keep steam ready.
LV Steam is ready.
LW Weigh and proceed as ordered.
MB Weigh, cut, or slip; get an offing.
MC Veer more cable.
MD Let go another anchor.
MF Shift your berth; your berth is unsafe.
MG Cut away your masts.
MH Hold on until high water.
MJ You will be aground at low water.
MK Lose no time in shoring up.

DIRECTIONS FOR SAVING CREW.

ML Remain by the ship.
MN Quit the vessel as fast as possible.
MP Do not quit the ship until the tide has ebbed.
MQ Landing is impossible.
MR Look out for rocket line.
MS Endeavour to send a line.
MT Boat should endeavour to land where flag is waved or light shown.
MV Look out will be kept on the beach all night.
MW Lights or fires will be kept at the best place for coming on shore.
NB Keep a light burning.

DISTRESS.

NC IN DISTRESS. WANT IMMEDIATE ASSISTANCE.
(*This Signal may also be made by day and by night with a rocket or shell which bursts in the air with a loud report.*)
ND Cannot save the ship. Take people off.
NF I must abandon the vessel.
NG Rudder disabled. Will you assist me into port indicated?
NH Ship disabled. Will you tow me into port indicated?
NJ I am unmanageable.
N I am in danger, or shoal water; direct me how to steer.
NL I am driving; no more anchors to let go.
NM I am attacked; want assistance.
NP I want assistance. Please remain by me.
NQ I will remain by you.
NR I have sprung a leak.
NS Leak is gaining rapidly.
NT I am sinking.

COLLISION, SHIPWRECKED CREW, &c.

NV Have been in collision.
NW Vessel seriously damaged; wish to transfer passengers.
PB Have you been in collision?
PC Has the vessel with which you have been in collision proceeded on her voyage?
PD The way is off my ship, you may feel your way past me.
PF Have shipwrecked crew on board; will you let me transfer them to you? (*Number to Follow, page* 73.)
NT *I am sinking.*

DERELICT SHIP.

PG Beware of derelict, dangerous to navigation.
PH Have you seen derelict?
PJ Saw derelict in lat. ——, long. ——.
For lat. and long., see pages 21–24.
Date to follow if necessary, page 28.

DISABLED STEAMER REPORTING DAMAGE.

PK Engines completely disabled.
PL Engine disabled, can repair do. in —— hours. (*Number to follow, page* 73.)
PM Have broken main shaft.
PN Have lost screw, or screw disabled.
PQ One screw disabled; can work the other.
PR Am disabled, Communicate with me.

DRAUGHT OF WATER AND PILOT.

PS What is your draught of water?
PT Want (or wants) a pilot; can one be obtained? (Answer "Yes" or "No.")

FIRE.

PV I am on fire.
PW With immediate assistance fire can be extinguished.
QB Fire is extinguished.
(*See* BOATS. DISTRESS.)

ICE SIGNALS.

QC Have encountered ice.
QD Have passed ice in latitude and longitude indicated. (*See pages* .)
QF Ice between 30° and 35° of long.
QG Ice between 35° and 40° of long.
QH Ice between 40° and 45° of long.
QJ Ice between 45° and 50° of long.
QK Ice between 50° and 55° of long.
QL Ice between 55° and 60° of long.
QM Ice between 60° and 65° of long.

LETTERS AND MAILS.

QN Will you take letters?
QP Have you letters, mails, or despatches for me or vessel indicated?
QR Have letters, mails, or despatches for you (*or vessel indicated*).

LIGHTERS.

QS Require lighter, or lighters. (*Number to follow if more than one, page* 73.)
QT Lighter, or lighters, are going to you.
QV There are no lighters available.
QW Lighter is adrift.

MAST-HEAD AND SIDE LIGHTS.

RB Your mast-head light is out, or wants trimming.
RC Your port side light is out, or wants trimming.
RD Your starboard side light is out, or wants trimming.

ORDERS, REPORTING SHIP.

RF Where are you from?
RG Where are you bound?
RH Indicate name of signal station.
RJ Your original orders are cancelled. I am directed to inform you to proceed to ——. (*Geographical Table, see page* 81.)
RK Your orders are at ——.
RL Proceed to port indicated. (*Geographical Table, page* .)
RM Shall I telegraph your owners?
RN I will telegraph for your orders if you will wait reply.
RP I have telegraphed for your orders.
RQ Can you await reply?
RS Will await reply.
RT I have orders to telegraph your passing.
RV Have you any message or telegraphic communication for me?
RW Report me to owners.
SB Report me to Lloyd's.
SC Send my message by signal letters instead of writing it at length.
SD Forward reply by telegraph to signal station indicated. (*Geographical Table, page* .)

PILOT.

PT *Want (or wants) a pilot; can one be obtained?* *Answer "Yes" or "No."*)

POSITION OF SHIP, LAT. AND LONG.

SF What is my position by bearings?
SG What is the name of lighthouse, or lightship, in sight, or on bearing indicated?

	POSITION OF SHIP, LAT. AND LONG.—(*continued*).		TOWING, OR BEING TOWED—(*continued*).
H	What is your latitude at present time? (*For Latitude Table, see page* 21.)	TS	Reduce speed, you are towing me too fast.
SJ	What is your longitude at present time? (*For Longitude Table, see page* 23.)	TV	You can proceed at any speed.
		TW	Veer more of the towing cable, or cables.
	SIGNAL FLAGS, SEMAPHORE CIPHER.	VB	Shorten in towing cable, or cables.
		VC	Cast off towing cable, or cables.
SK	Repeat ship's name; your flags were not made out.	VD	Towing cable, or cables, is, or are, cast off.
SL	Repeat your signal, or place it in a more conspicuous position. It is not understood.	VF	Towing cable, or cables, is, or are, damaged or stranded.
SM	Cannot make out your flags, come nearer, or make distant signal.*	VG	Stop engines to adjust towing cables.
SN	Repeat signal from word indicated.	*JH*	*Man overboard.*
SP	I am going to repeat signal from word indicated.	*KR*	*Steer more to port.* (*To be kept flying until course is sufficiently altered.*)
SQ	You may work the semaphore.	*KS*	*Steer more to starboard.* (*Ditto.*)
SR	Following signal (or communication) is in cipher.†		
ST	Give me the key to cipher.‡		WANTS.
SV	Cipher is ended.	VH	Want water immediately.
		VJ	Want (or wants) assistance; mutiny.
	STEAM WHISTLE OR SIREN.	VK	Want (or wants) immediate medical assistance.
		VL	Want (or wants) boat or boats immediately.
SW	Blow steam whistle or siren at intervals.	VM	Want (or wants) provisions immediately.
TB	Shall signal with steam whistle, or siren, during fog or darkness.	VN	Want (or wants) coal immediately.
		VP	Want (or wants) an anchor.
	TORPEDO; TORPEDO-BOATS.	VQ	Want (or wants) an anchor and cable.
		VR	Want (or wants) a cable.
TC	Is there danger of mines or torpedoes?	VS	Want (or wants) police.
TD	Beware of torpedoes. The channel is mined.	VT	Want (or wants) steam-tug or tugs. (*If more than one, number to follow, page* 73.)
TF	Beware of torpedo-boats.	VW	Want (or wants) immediate instructions.
TG	Have you seen torpedo-boat or boats?	WB	Want (or wants) hands.
TH	Saw torpedo-boat, or boats, at, or near ——. (*Geographical Table, see page* 81.)	WC	Want chart or plan of channel, harbour, &c.
		WD	
	TOW, TUGS.		WAR NEWS.
TJ	I wish to be taken in tow.	WF	Is war declared, or has war commenced?
TK	Shall I take you (*or ship indicated*) in tow?	WG	War is declared, or has commenced.
TL	Will take you (*or ship indicated*) in tow.	WH	War between —— and ——.
TM	Cannot take you (*or ship indicated*) in tow.	WJ	Armistice has been arranged.
TN	Tug is going to you.	WK	Is peace proclaimed?
TP	There are no tugs available.	WL	Peace is proclaimed.
NH	*Ship disabled; will you tow me into port indicated?*		
VT	*Want or wants steam-tug or tugs.*		WEATHER.
		WM	What is weather forecast?
	TOWING, OR BEING TOWED.	WN	No weather report.
		WP	North cone hoisted.
	See also under "Hawser" and "Tow," Alphabetical Table.	WQ	South cone hoisted.
		WR	Bad weather is expected. (*See* Compass Signals.)
TQ	Are towing cables, or is cable, fast?	WS	Storm centre (in direction indicated); probable course towards (direction indicated).
TR	Towing cable, or cables, is, or are, fast.	WT	
		WV	

Inclosure (F).

Abstract of Replies received to the following Letter, dated January 20, 1888.

SIGNALS.

Board of Trade (*Marine Department*), *London*,
January 20, 1888.

I have the pleasure to forward, for your information, the inclosed copy of the Order of Reference to the Committee which has been appointed by Lord Stanley of Preston to consider and report upon questions affecting the International Code of Signals.

The Committee are very desirous of obtaining the opinions of ship-owners, and of the mercantile marine generally, upon the points referred to in paragraphs 2, 3, 4, 5, and 6 of the Order of Reference, and I am to request that you will be good enough to favour me (for the information of the Committee), and at as early a moment as may be convenient to you, with any observations in the matter which your experience, or that of the officers in your employment, may enable you to offer.

I am, &c.
(Signed) THOMAS GRAY,
Chairman of the Committee.

* See Distant Signal Code, page 206, Part III. † Cipher will continue until the person signalling hoists SV.
‡ This may be prearranged, &c.

Reference.

Upon the following matters, viz. :—

1. To bring the International Signal Book up to date.

2. To report whether the time has arrived when it may be deemed desirable to establish a system whereby the signals in the International Code Book may be made by night as well as by day.

3. To report whether there is a general demand on the part of the mercantile marine for such a system, and, if so, what system should be adopted.

4. To report (if a system whereby the signals in the International Code Book could be made at night were established) whether any danger is likely to arise therefrom owing to the inducement it might afford to ships to approach one another closely at night for the purpose of signalling.

5. To report whether there ought to be any, and, if so, what restrictions on the use of night signals, especially in crowded waters, as, for instance, the English and Irish Channels.

6. If the Committee do not recommend the establishment of any general system of night signals to report whether it is, in their opinion, desirable (in addition to the present distress signals) to establish some special warning signals to indicate danger to passing vessels, *e.g.* :—

"I am in need of immediate assistance,"
"You are standing into danger,"
"I have encountered ice,"
"I have passed a derelict dangerous to navigation,"

or any other warning signals in the interest of safety; and, if so, what those signals should, in their opinion, be, and by what means they should be made.

Persons, Firms, Societies, &c., applied to for Observations.	Date of Reply.	2. Whether the time has arrived for establishing a system whereby the signals in the International Code Book may be made by night as well as by day?	3. If there is a general demand for such a system, what system should be adopted?	4. If such a system were established, whether any danger is likely to arise therefrom owing to the inducement it might afford to ships to approach one another too closely at night for the purpose of signalling?	5. To report whether there ought to be any, and, if so, what restrictions on the use of night signals, especially in crowded waters?	6. Is it desirable to establish some special warning signals to indicate danger to passing vessels? If so, what should they be, and by what means should they be made?
Devitt and Moore	Jan. 23, 1888	Thinks it would be a good thing to have night signals placed on a proper footing.				
MacIver, C.	Jan. 25, 1888	Yes. Thinks such a system should be arranged.	Very little occasion for it in time of peace. Recommends system of Captain Walls and Lieutenant Sellners.	Does not anticipate additional danger.	As the advisability of communicating by night occurs so seldom, is undesirous of placing special restrictions on masters.	Yes; by lamps. For distress signals, only rockets or port fires should be used.
Shaw, Savill, and Albion Company (Limited), per J. McKirby, Marine Superintendent.	Jan. 28, 1888 Feb. 3, 1888 Feb. 6, 1888	No .. .. (Thinks vocabulary needs altering, so that sentences bearing on the same subject should be grouped together.)	Is not aware of any demand. Recommends the Morse system, if any is adopted.	Yes, decidedly; by diverting attention of the officer of the watch.	Such restrictions would render any system valueless.	Thinks the Roman candle should be used solely for urgent international (and not for private) signalling. For certain signals, suggests combinations of red, white, and green stars, which could be discharged from a revolver.
Inclosure. Evans, E. J., Chief Officer.	..	Thinks such a system would be little used, as he has never seen even the present distance signals used.	A system worked by lights would be more confusing than useful.	Would not increase safety, and would probably lead indirectly to accidents.	Signals should not extend beyond the present private signals, and an extension of danger or distress signals.	Rockets as private signals should be abolished. Suggests a code of eighteen danger and distress signals commencing with a rocket. (Is prepared to draw up a more detailed code.)
General Ship-owners' Society ..	Jan. 30, 1888	No	No general demand	Think there is great danger in the multiplication of lights.	..	Recommend a rocket of a distinct character as a "caution" and "distress" signal, and strongly urge that the use of rockets for any other purpose should be forbidden.
Orient Steam Navigation Company (Limited).	Jan. 31, 1888	Not desirable.	No demand	Would in all probability cause confusion.	Any use of night signals in crowded waters would probably result in disaster.	Present distress signals ample.
Union Steam-ship Company (Limited).	Jan. 31, 1888 Apr. 9, 1888	Submit the opinions of their senior commanders.				
Inclosure No. 1. Larner, G., Master Mariner	..	No	No general demand	Yes..	Does not approve of a general system of night signalling, but if adopted, thinks it should be restricted in crowded waters.	Thinks warning signals of extraordinary importance desirable, but is not prepared to suggest their character.

Persons, Firms, Societies, &c., applied to for Observations.	Date of Reply.	2. Whether the time has arrived for establishing a system whereby the signals in the International Code Book may be made by night as well as by day?	3. If there is a general demand for such a system, what system should be adopted?	4. If such a system were established, whether any danger is likely to arise therefrom owing to the inducement it might afford to ships to approach one another too closely at night for the purpose of signalling?	5. To report whether there ought to be any, and, if so, what restrictions on the use of night signals, especially in crowded waters?	6. Is it desirable to establish some special warning signals to indicate danger to passing vessels? If so, what should they be, and by what means should they be made?
Union Steam-ship Company (Limited) (*continued*).						
Inclosure No. 2. Bainbridge, W., Master Mariner.	..	Yes..	A general demand only among the higher grades in the service. Recommends the "Morse" system applied by means of flags by day, lamps by night, and steam-whistle in fog.	No	Yes, at first; until the system is well established.	Strongly recommends the four signals mentioned.
Inclosure No. 3. Griffin, E., Master Mariner.	..	Yes..	Thinks there is a growing demand	No	Should be restricted to urgent signals only, which should be clearly laid down.	Yes; a few urgent ones should be clearly laid down.
Inclosure No. 4. Hoste, H. S., Master Mariner.	..	If the time has not arrived, thinks it soon will.	Has never found need for night signals, but if adopted, should recommend the "Morse."	No	Vessels do not find it necessary to signal in crowded waters except on very special occasions.	Yes; by means of a rocket or a rocket signal, followed by combinations of three or four lights.
Inclosure No. 5. Leigh, R. A., Master Mariner.	..	Yes..	Is not aware of a general demand. If a system were adopted, suggests the flash system.	No need for close approach with the flash system.	Must be considered when the system is decided upon.	Recommends four urgent signals to be made by means of cannon and rockets, avoiding lanterns.
Inclosure No. 6. Owen, H., Master Mariner.	..	Yes..	Yes; by means of the flashing system with a good lantern.	No; as the ship in danger could signal "You are approaching me too closely."	No; but to avoid crowding off signal stations, pyrotechnic signals should be used as at present.	Yes; by means of blue, white, and red pyrotechnic fires.
Inclosure No. 7. Travers, H. D., Master Mariner.	..	Yes..	Yes. Recommends "Morse" flashing system.	No	No	Recommends three additional distress night signals made by means of red globe lamps, and red and green fires. By day a black ball to be hoisted in addition to flag signals. At present many private signals too closely resemble the statutory distress signals.
Inclosure No. 8. McLean, W. A., Master Mariner.	..	No	No	Yes; if night signals are used generally.	If adopted, should be restricted to urgent cases only.	Yes; by means of combinations of white lights.

Persons, Firms, Societies, &c., applied to for Observations.	Date of Reply.	2. Whether the time has arrived for establishing a system whereby the signals in the International Code Book may be made by night as well as by day?	3. If there is a general demand for such a system, what system should be adopted?	4. If such a system were established, whether any danger is likely to arise therefrom owing to the inducement it might afford to ships to approach one another too closely at night for the purpose of signalling?	5. To report whether there ought to be any, and, if so, what restrictions on the use of night signals, especially in crowded waters?	6. Is it desirable to establish some special warning signals to indicate danger to passing vessels? If so, what should they be, and by what means should they be made?
Peninsular and Oriental Steam Navigation Company.	Feb. 1, 1888	Think it doubtful, as the subject does not form a part of Board of Trade examination of masters and mates for certificates. Recommend system of flashing lights for night signalling as in Royal Navy, but think about three years' notice would be necessary, so that applicants for, and holders of, certificates could be examined in the interval.	Are not aware of any general demand. Rather the contrary.	There is some element of danger, but not to any great extent.	Yes. Must be restricted, and only used in cases of great emergency. Disapprove of multiplication of lights.	A few, not exceeding six, additional signals would be of advantage—to be used only in extreme circumstances, and made by means of bright and coloured lamps, vertical, horizontal, and diagonal, with a detonating signal to attract attention.
New Zealand Shipping Company (Limited), per Hallett, E. V., Marine Superintendent.	Feb. 3, 1888	Thinks a few simple ones, to be used in cases of great emergency, would be of great advantage.	Thinks there is no general demand.	There would be some, but not to any extent.	Such signals should be used only in cases of great emergency.	Yes; by means of bright and coloured lamps, vertical, horizontal, and diagonal, with a detonating signal to attract attention. Recommends Colomb's flashing lights, and thinks a knowledge of this system should be encouraged, it being little understood at present.
MacGregor, Jas. .. .. (MacGregor, Gow, and Co.)	Feb. 8, 1888	No general desire to extend the system of signals in the International Code Book to the night.		Great danger might arise ..	Such restrictions would be difficult	Recommends special warning signals to indicate where danger might be apprehended.
Ismay, Imrie, and Co. ..	Feb. 8, 1888	No	Not aware of any	Yes..	Only signalling of the most necessary kind should be allowed in crowded waters.	It may be desirable. If so, think that signals of distress, warning, or urgent need might be made at night by means of white and red lamps.
London and North-Western Railway Company.	Feb. 9, 1888	Yes..	If a demand is found to exist, recommend a portable flashing lamp on the "Morse" system.	Do not anticipate any	Think that when officers know where they are and tugs are plentiful the signals would not be much used.	Yes.
Cunard Steam-ship Company (Limited).	Feb. 11, 1888	Not desirable..	..	..	..	No.

Persons, Firms, Societies, &c., applied to for Observations.	Date of Reply.	2. Whether the time has arrived for establishing a system whereby the signals in the International Code Book may be made by night as well as by day?	3 If there is a general demand for such a system, what system should be adopted?	4. If such a system were established, whether any danger is likely to arise therefrom owing to the inducement it might afford to ships to approach one another too closely at night for the purpose of signalling?	5. To report whether there ought to be any, and, if so, what restrictions on the use of night signals, especially in crowded waters?	6. Is it desirable to establish some special warning signals to indicate danger to passing vessels? If so, what should they be, and by what means should they be made?
Henderson Brothers .. .. (Anchor Line.)	Feb. 13, 1888	Yes. They also submit Reports of three of their experienced commanders, who have not communicated with each other on the subject.	Yes. The dot and dash telegraphic code exemplified by means of coloured flashing lights.	Yes, to some extent. In order to obviate danger and prevent delay recommend that a ship desiring to signal should make the wish known by firing guns.	No; provided that the firing of the signal gun precedes signalling.	Recommends six warning signals on dot and dash system.
Inclosure No. 1. Brown, W., Master Mariner.	..	Recommends the dot and dash system for signals in which the Code is deficient. At night, by flashes. In fog, when under weigh, by blasts. In fog, at anchor, by bell. These could be repeated by the other ship to insure accuracy.				
Inclosure No. 2. Campbell, A., Master Mariner.	..	Yes..	Yes; and suggests the "dot and dash" system.	Yes; and, therefore, the utmost caution would be necessary in their use.	Utmost care would be necessary in the use of light and sound signals in the vicinity of lighthouses in the English and Irish Channels.	Present distress signals sufficient, but suggests certain warning signals, a red rocket with red stars being used for the purpose.
Inclosure No. 3. Hedderwick, J., Master Mariner.	..	Yes..	Thinks there is a desire. Suggests the use of red and white flashes.	Yes; and, therefore, increased caution would be needed.	Any system requiring restriction should not be adopted.	Recommends a selection of sentences, to be called important communications, distinguished by day by flying the ensign at the fore, and at night by hoisting a red light at the fore and signalling with red and white flashes.
Royal Mail Steam-packet Company.	Feb. 15, 1888	Occasionally night signals might prove useful.	No. If adopted, caution would have to be used to prevent confusion.	Yes.		
Telegraphic Construction and Maintenance Company (Limited).	Feb. 16, 1888	Yes..	Think there is no general demand, but recommend the "Morse" system, with coloured lights and the steam-whistle or fog-horn for sound-signals.	Not with ordinary care	Think that night signalling with coloured lamps at pilot stations should not be used except in cases of extreme urgency.	Think that present danger signals should be emphasized by the firing of guns or by detonating signals in such a manner as not to be mistaken for other signals. Also strongly suggest the use of one distinctive signal to cover certain sentences, either by specially good red lamps, port fires, or detonating signals. Recommend that officers should be examined in the "Morse" Code.

Persons, Firms, Societies, &c., applied to for Observations.	Date of Reply.	2. Whether the time has arrived for establishing a system whereby the signals in the International Code Book may be made by night as well as by day?	3. If there is a general demand for such a system, what system should be adopted?	4. If such a system were established, whether any danger is likely to arise therefrom owing to the inducement it might afford to ships to approach one another too closely at night for the purpose of signalling?	5. To report whether there ought to be any, and, if so, what restrictions on the use of night signals, especially in crowded waters?	6. Is it desirable to establish some special warning signals to indicate danger to passing vessels? If so, what should they be, and by what means should they be made?
Chamber of Shipping of the United Kingdom.	Mar. 6, 1888	No	No	Think there is great danger in the multiplication of lights.	..	Think Colonel "Hill's" proposals that the direction a ship is steering should be indicated by steam-whistle signals is worth consideration.
Allan, J. and A. (Allan Line) ..	Mar. 21, 1888	Suggest that sailing-vessels should have better lights, so that steamers would be able to perceive them at a greater distance, and recommend that steamers should have two white masthead lights and a coloured light added when they are towing. They also submit Reports from twenty-one of their commanders.				
Inclosure No. 1. Allan, J. A., Master Mariner	..	No	No	No	No	Thinks a few special warning signals necessary to be made by combinations of the "Coston" pyrotechnic light if confusion with private signals can be avoided. For a general system, recommends the flash system of the Navy.
Inclosure No. 2. Ambury, J., Master Mariner	..	It is very desirable	Not aware of any general demand; but if adopted, should be made by powerful lights. Pyrotechnic lights, being so variously used as private signals, would cause confusion.	No; if caution is observed ..	It would be difficult to make restrictions.	Present distress signals are sufficient. The signal, "I am in need of immediate assistance," should be followed by a gun in very urgent cases. There should also be signals for warning other vessels of danger.
Inclosure No. 3. Barrett, R., Master Mariner	..	Yes..	Is not aware of any general demand, but recommends "Eastaway's" system of lights.	No; but caution will be necessary.	Should be restricted to cases of great necessity only.	Additional signals should be very simple. Urgent signals should be preceded by a distress signal.
Inclosure No. 4. Bentley, J., Master Mariner	..	No	No	Yes; especially in crowded channels.	(See No. 4)	Yes; by means of red, green, and white lights.
Inclosure No. 5. Brown, J., Master Mariner	..	Yes..	Is unable to say. Thinks that red and green lights should be used exclusively for side-lights. Recommends combinations of four orange-coloured lights for night signals.	No; for vessels could signal at a distance instead of approaching to hail as they now sometimes do.	No, as they would be of most use in narrow channels.	Yes. Recommends five additional urgent signals. Thinks that pyrotechnic lights, rockets, &c., should not be used, as causing confusion with present private signals.

Persons, Firms, Societies, &c., applied to for Observations.	Date of Reply.	2. Whether the time has arrived for establishing a system whereby the signals in the International Code Book may be made by night as well as by day?	3. If there is a general demand for such a system, what system should be adopted?	4. If such a system were established, whether any danger is likely to arise therefrom owing to the inducement it might afford to ships to approach one another too closely at night for the purpose of signalling?	5. To report whether there ought to be any, and, if so, what restrictions on the use of night signals, especially in crowded waters?	6. Is it desirable to establish some special warning signals to indicate danger to passing vessels? If so, what should they be, and by what means should they be made?
Allan, J. and A. (Allan Line) —(*continued*).						
Inclosure No. 6. Carruthers, R., Master Mariner.	..	Yes; but it should only be used for "warnings."	Has not heard it expressed. Suggests three distinct lights in place of ball, pennant, and square flags, with general code signal to attract attention.	Not if a distinct code signal can be adopted.	Should be restricted to warning or relief signals.	(As in No. 3.)
Inclosure No. 7. Dalziel, W., Master Mariner	..	There ought to be some system, but not a complete code made by too many different coloured lights.	Yes; to be made by red and white lights only.	Yes..	Should be restricted in crowded waters to urgent signals only.	Yes; by means of red and white lights shown in different positions.
Inclosure No. 8. Dunlop, W., Master Mariner.	..	..	Is not aware of any general demand.	Yes..	Should be restricted to urgent signals only in narrow waters.	Yes. Red, green, and white lights in place of ball, pennant, and flag, but the number and variety of private signals now in use would render any system difficult.
Inclosure No. 9. France, J., Master Mariner.	..	No, unless a very simple system can be adopted.	No	Yes..	No	Recommends combinations of red, green, and white lights to be used for urgency and demand signals.
Inclosure No. 10. Hughes, R. H., Master Mariner.	..	Yes..	Yes. Recommends the Navy system of flashing lights.	No occasion for vessels to approach dangerously near.	..	Present distress signals sufficient. Recommends "Wynaeke's" system.
Inclosure No. 11. James, D. J., Master Mariner.	..	Thinks the time has arrived ..	Not aware of any general demand.	No; if precautions are taken ..	No	Present distress signals should not be changed. Recommends blue, white, and red lights for urgent signals.
Inclosure No. 12. McDougall, A., Master Mariner.	..	Yes..	Yes. Recommends a system of red, white, and green flashes, but does not approve of a system increasing the number of lights to be encountered.	Yes; unless the flashes are powerful enough.	Yes. Vessels signalling should not approach each other nearer than 1 mile, and night signals should not be used except in urgent cases either in channels or at sea.	Recommends eight additional urgency signals. Thinks there should be a new distinct fog signal for indicating a vessel's course.

Persons, Firms, Societies, &c., applied to for Observations.	Date of Reply.	2. Whether the time has arrived for establishing a system whereby the signals in the International Code Book may be made by night as well as by day?	3. If there is a general demand for such a system, what system should be adopted?	4. If such a system were established, whether any danger is likely to arise therefrom owing to the inducement it might afford to ships to approach one another too closely at night for the purpose of signalling?	5. To report whether there ought to be any, and, if so, what restrictions on the use of night signals, especially in crowded waters?	6. Is it desirable to establish some special warning signals to indicate danger to passing vessels? If so, what should they be, and by what means should they be made?
Allan, J. and A. (Allan Line)—(*continued*).						
Inclosure No. 13. Macnicol, A., Master Mariner.	..	..	No	Yes..	..	Recommends a few additional simple warning and urgency signals.
Inclosure No. 14. Moore, R. P., Master Mariner.	..	Not necessary to adopt the whole code for night signals.	Knows of no general demand ..	Yes..	Night signals should only be used in open waters.	Recommends the four additional signals given in the Order of Reference made by means of red and white globe lamps.
Inclosure No. 15. Park, J., Master Mariner ..	..	Yes..	Not aware of any general demand. Recommends bright blue and red lights placed vertically as warning signals.	No; if precautions are taken ..	Certainly not. Action in urgent cases may be hampered by restrictions; some risk must be run in order to save life.	Present distress rocket signal sufficient. (See reply to No. 3 for warning signals.)
Inclosure No. 16. Richardson, W., Master Mariner.	..	Thinks that any system introduced would have to be made by means of lights, and as the glare of light would be blinding, it would be better not to have them. Recommends rockets or a strong light, often repeated, for distress signals. It is at all times desirable to have warning of danger ahead.				
Inclosure No. 17. Ritchie, J., Master Mariner	..	No	No	Yes..	Night signals should be used only in urgent cases.	Any special night signals should be used only by ships in distress and for saving life.
Inclosure No. 18. Smith, W. H., Master Mariner.	..	No	Has not heard any general demand expressed. Thinks some flashing system, such as the "Morse," would be the best system if any is adopted.	Not if caution is used	Not if proper precautions are adopted.	Yes; an explosive rocket to warn vessels approaching danger; also as a means of attracting attention previous to important signalling.
Inclosure No. 19. Stephen, J. G., Master Mariner.	..	Yes	Recommends a system of coloured lights.	Yes; therefore should only be used in urgent cases.	Should not be used except in the interests of safety.	Thinks warning signals might be made by means of coloured lights placed vertically, the signal to be preceded by a bomb rocket to attract attention.
Inclosure No. 20. Watts, R. S., Marine Superintendent.	..	Yes..	Thinks not. On the contrary, practical men dread a system that would increase the number of lights.	Yes; but the danger would be partly obviated by forbidding complimentary signalling.	Recommends a deck flare for attracting attention, to be used exclusively in urgent cases.	Refers to inclosure by Mr. Eastaway, the second officer of the "Circassian," containing coloured plan of night signals, which would meet all cases.

Persons, Firms, Societies, &c., applied to for Observations.	Date of Reply.	2. Whether the time has arrived for establishing a system whereby the signals in the International Code Book may be made by night as well as by day?	3. If there is a general demand for such a system, what system should be adopted?	4. If such a system were established, whether any danger is likely to arise therefrom owing to the inducement it might afford to ships to approach one another too closely at night for the purpose of signalling?	5. To report whether there ought to be any, and, if so, what restrictions on the use of night signals, especially in crowded waters?	6. Is it desirable to establish some special warning signals to indicate danger to passing vessels? If so, what should they be, and by what means should they be made?
Allan, J. and A. (Allan Line) —(*continued*). Inclosure No. 22. Wylie, H., Master Mariner.	--	No	No	No	Rockets should not be allowed in crowded waters except as signals of distress.	When field ice is encountered, recommends a warning signal to be made by means of burning six blue lights consecutively.
Smith, G., and Sons	Mar. 22, 1888	Thinks it would be a mistake. Now that steamers are employed the necessity of speaking one another is done away with.	No	There is danger when large steamers approach each other.	Signalling should be forbidden in crowded waters, except in urgent cases or in need of pilot.	If distress and warning signals are adopted, they should be of a distinct character.
Holt, A., Liverpool	Apr. 24, 1888	After discussing the subject with others qualified to form an opinion, has somewhat hesitatingly come to the conclusion that the proposal should not be carried out at present.				
Aberdeen Local Marine Board ..	Jan. 27, 1888	..	No demand	..	..	Yes. The distress signal should be a thoroughly distinctive one. Suggest a competition for best code of signals.
London Local Marine Board ..	Jan. 28, 1888	Yes; to a limited extent ..	Not aware of any	Danger might arise by withdrawing the attention of the watch, and a general system would become a dead letter as the night watch consists usually of only one officer and the "look out."	Night signals should be available in all waters and under any circumstances.	Recommend two additional distress signals: (1) red and white flare asking for immediate assistance; and (2) red and blue flare for warning other vessels of danger.
Dundee Local Marine Board ..	Feb. 1, 1888	No	No demand	Yes..	Think that private signals of such a nature as to be mistaken for distress signals should not be permitted.	Present distress or danger signals ought to suffice if amplified in a simple manner, to show nature of circumstances in which vessel is placed.
North Shields Local Marine Board.	Feb. 3, 1888	Present distress signals sufficient.	Further night signals undesirable.			

Persons, Firms, Societies, &c., applied to for Observations.	Date of Reply.	2. Whether the time has arrived for establishing a system whereby the signals in the International Code Book may be made by night as well as by day?	3. If there is a general demand for such a system, what system should be adopted?	4. If such a system were established, whether any danger is likely to arise therefrom owing to the inducement it might afford to ships to approach one another too closely at night for the purpose of signalling?	5. To report whether there ought to be any, and, if so, what restrictions on the use of night signals, especially in crowded waters?	6. Is it desirable to establish some special warning signals to indicate danger to passing vessels? If so, what should they be, and by what means should they be made?
Greenock Local Marine Board ..	Feb. 9, 1888	Not required unless for cases of danger or when in fog.	Not aware of any	..	..	Suggest a system of signalling for steamers by means of high and low notes on whistles, to be used in fog or danger.
South Shields Local Marine Board.	Feb. 13, 1888	No	No	Yes..	Rockets should be forbidden for private and other signals, and used exclusively for distress signals.	Present distress signals are sufficient.
Leith Local Marine Board ..	Feb. 14, 1888	Submit a Report, in which they concur, from the Scottish Ship-masters' Asssociation.				
Inclosure. Scottish Ship-masters' Association.	..	Yes..	There is only a limited demand. The majority of the Association are in favour of the "Morse" flashing system. Others approve of the fog-whistle, fog-horn, or fog-bell being used on the "Morse" system.	Yes..	In any case night signalling should be restricted to urgent cases only.	Suggest three additional warning signals for crowded waters by long and short blasts on the steam-whistle or horn.
Cork Local Marine Board ..	Feb. 15, 1888	Yes..	There is no general demand because it would increase cost of outfit and give extra trouble. Recommend coloured fireballs, Roman candles, &c., as not interfering with present signals, but think they should not be made compulsory.	No	No	Recommend five signals in addition to those named in the Order of Reference, and suggest the use of fireballs.
Newcastle Local Marine Board..	Feb. 15, 1888	May be desirable, but they are opposed to any extended or elaborate system of night signals.	No	Yes..	..	Recommend a simple system of urgent danger and distress signals, to be made by means of red, white, and green globe lamps.
Dublin Local Marine Board ..	Mar. 21, 1888	Yes, if it can be done safely ..	..	It should not offer an inducement to run into danger.	..	Such signals are desirable.
Liverpool Local Marine Board ..	Mar. 23, 1888	Inclose copies of replies from three Associations.				
Inclosure No. 1. Liverpool Steam-ship Owners' Association.	..	No	No	Yes..	Night signals should be restricted to urgent cases only, especially in crowded waters.	Yes; by means of red and white lamps.

Persons, Firms, Societies, &c., applied to for Observations.	Date of Reply.	2. Whether the time has arrived for establishing a system whereby the signals in the International Code Book may be made by night as well as by day?	3. If there is a general demand for such a system, what system should be adopted?	4. If such a system were established, whether any danger is likely to arise therefrom owing to the inducement it might afford to ships to approach one another too closely at night for the purpose of signalling?	5. To report whether there ought to be any, and, if so, what restrictions on the use of night signals, especially in crowded waters?	6. Is it desirable to establish some special warning signals to indicate danger to passing vessels? If so, what should they be, and by what means should they be made?
Liverpool Local Marine Board —(*continued*).						
Inclosure No. 2. Mercantile Marine Service Association.	..	Yes..	Yes. A simple system on the "Morse" principle.	..	..	Desirous of a signal to indicate the course being steered by another vessel.
		(They suggest that all the points should be referred to the International Conference proposed by the United States. They have suggested to the United States' Consul that the Conference should be held in England.)				
Inclosure No. 3. Ship-owners' Association, Liverpool.	..	No. It would be very undesirable, because it would increase the number of lights.	..	Yes..	..	Recommend a night signal to indicate which way a vessel is steering.
Plymouth Local Marine Board ..	Mar. 29, 1888	No	No	Yes.		
Belfast Local Marine Board ..	Apr. 10, 1888	..	..	..	..	Some special warning night signals seem desirable.
Inclosure. Porter, W. (J. P.) ..	Apr. 11, 1888	Suggests for revision of signal code that a voyage exceeding 100 days and degrees and minutes of longitude should each be reduced to one hoist. Geographical and spelling vocabularies require enlargement.				
Glasgow Local Marine Board ..	Apr. 13, 1888	Suggest that further consideration of this subject should be deferred until the International Signals Conference proposed by the United States is held.				
Hull Local Marine Board ..	May 8, 1888	Submit opinions of ship-owners and masters as follows:—				
Inclosure No. 1. Bailey and Leetham ..	May 8, 1888	If adopted, should not be compulsory.	No	Yes; dangers of collision and strandings increased.	Yes; rockets should be used only as distress signals.	Yes, in certain cases; say one distinctive signal denoting ice or other danger ahead.
Inclosure No. 2. Briggs, Hy., Sons, and Co..	May 8, 1888	No				
Inclosure No. 3. Cammell, Woolff, and Haigh	May 8, 1888	Think from inquiries made that additional signals would cause more confusion.				

Persons, Firms, Societies, &c., applied to for Observations.	Date of Reply.	2. Whether the time has arrived for establishing a system whereby the signals in the International Code Book may be made by night as well as by day?	3. If there is a general demand for such a system, what system should be adopted?	4. If such a system were established, whether any danger is likely to arise therefrom owing to the inducement it might afford to ships to approach one another too closely at night for the purpose of signalling?	5. To report whether there ought to be any, and, if so, what restrictions on the use of night signals, especially in crowded waters?	6. Is it desirable to establish some special warning signals to indicate danger to passing vessels? If so, what should they be, and by what means should they be made?
Hull Local Marine Board—(*continued*).						
Inclosure No. 4. Good, Flodman, and Duncan.	May 8, 1888	Yes..	Not sufficiently experienced to give detailed opinion.			
Inclosure No. 5. Jackson, Beaumont, and Co.	May 8, 1888	Think it important that steamers should be able to communicate by night as well as by day.	..	..	Yes; increase of lights very dangerous in crowded waters.	
Inclosure No. 6. Lofthouse, C. M., and Co. .	May 8, 1888	No	No	No	Yes..	Yes. Submit sketch of iron frame for four special warning signals.
Inclosure No. 7. Moran, Wm., and Co. ..	May 8, 1888	Not aware of any improvements they could suggest.				
Inclosure No. 8. Ringrose, W. C. L. ..	May 8, 1888	Think it desirable	That signals for this purpose should be hoisted well clear of regulation lights.	Not if confined to urgent, &c., matters.	Yes; night signalling should be confined to the more urgent and important matters.	
Inclosure No. 9. Woodhead, T. D., and Co. .	May 8, 1888	Think a system of night signals to firms who have a large fleet of steamers would be of much service.				
Inclosure No. 10. Coyst, Master Mariner ..	May 8, 1888	Doubtful	Thinks not	Yes..	Yes; only to be used by ship in distress.	Yes; the simplest possible.
Inclosure No. 11. Hallsey, D. T., Master Mariner.	May 8, 1888	No	No demand	Very dangerous in crowded waters.	The greatest restrictions ..	Thinks that no additions to present distress signals are desirable.
Inclosure No. 12. Kelsey, Thos., Master Mariner.	May 8, 1888	Yes..	Yes; signals to be made with coloured lamps.	No	Signals should not be kept out longer than necessary.	Thinks a red flare would answer all purposes.
Inclosure No. 13. Lee, Rd., Master Mariner..	May 8, 1888	Yes..	Yes. Suggests red, green, and white lights shown vertically and otherwise.	Should be limited, or would prove dangerous in narrow waters.	Thinks it should be restricted to reporting ships' danger and urgent signals.	Yes; six special signals by means of coloured lights.
Inclosure No. 14. Peters, A. R., Master Mariner.	May 8, 1888	Yes..	Yes. Suggests coloured lights shown horizontally, vertically, and otherwise.	No	Yes. Should be confined to reporting ships, and to danger and urgent signals.	Thinks some alteration ought to be made in the signal for a vessel not under command.

Persons, Firms, Societies, &c., applied to for Observations.	Date of Reply	2. Whether the time has arrived for establishing a system whereby the signals in the International Code Book may be made by night as well as by day?	3. If there is a general demand for such a system, what system should be adopted	4. If such a system were established, whether any danger is likely to arise therefrom owing to the inducement it might afford to ships to approach one another too closely at night for the purpose of signalling?	5. To report whether there ought to be any, and, if so, what restrictions on the use of night signals, especially in crowded waters?	6. Is it desirable to establish some special warning signals to indicate danger to passing vessels? If so, what should they be, and by what means should they be made?
Hull Local Marine Board—(*continued*).						
Inclosure No. 15. Tether, Rd. E., Master Mariner.	May 8, 1888	Not desirable	No	Great danger, especially in crowded waters.	The most stringent restrictions to signals affecting the near navigation, or the immediate safety of the ships in communication.	Present signals are all that is required.
Inclosure No. 16. Walskitt, J., Master Mariner	May 8, 1888	Present signals answer all requirements.				
Inclosure No. 17. Winship, C., Master Mariner	May 8, 1888	Not advisable to adopt such a system, the present system being all that is required.				

Inclosure (G).

Note showing proposed Alteration at pages xv *and* xvi *of the Signal Book.*

Extract from the Report of a Committee of 1855.

First, its comprehensiveness and distinctness, the *combination of the signs expressing the nature* of the signal made—[two* flags or symbols in a hoist always meaning either *Danger* or *Urgency*]—and the signals throughout being arranged in a consecutive series, so that any individual signal, whether a word or a sentence, may readily be found; secondly, that the flags and pennants are so arranged as by their position to characterize the signals made: thus—

* [In signals made with two signs—
The burgee *uppermost* represents ... ... *Attention* Signals
A pennant *uppermost* represents ... ... *Compass* Signals.
And a square flag *uppermost* represents ... ... *Danger* Signals.]

In signals composed of four signs—
The burgee *uppermost* represents ... ... *Geographical.*
A pennant *uppermost* represents ... ... *Vocabulary.*
And a square flag *uppermost* represents ... ... *Ships' Names.*

And thirdly, that the arrangement of the Code is such *as to hold out to foreigners the same advantages* that it affords to our own Marine.

This Committee [of 1888] have slightly departed from the recommendations contained in the last part of the above Report as follows, viz.:—

Instead of the words* in brackets as above, this Committee have adopted the following words:

* [Two flags in one hoist mean attention and demand; compass, and urgent or important signals, which are now classed into three groups, according to the sign which is uppermost, as follows, viz.:

A two-sign signal with—
The burgee uppermost represents ... ... Attention or Demand
A pennant uppermost represents ... ... Compass Signals.
A square flag uppermost represents ... Urgency or Importance.]

Supplementary Inclosure to Interim Report.

SINCE the publication of Parliamentary Paper C. 5695, the following additional Replies to the letter dated January 20, 1888 (Inclosure F), have been received.

Persons, Firms, Societies, &c., applied to for Observations.	Date of Reply.	2. Whether the time has arrived for establishing a system whereby the signals in the International Code Book may be made by night as well as by day?	3. If there is a general demand for such a system, what system should be adopted?	4. If such a system were established, whether any danger is likely to arise therefrom owing to the inducement it might afford to ships to approach one another too closely at night for the purpose of signalling?	5. To report whether there ought to be any, and, if so, what restrictions on the use of night signals, especially in crowded waters?	6. Is it desirable to establish some special warning signals to indicate danger to passing vessels? If so, what should they be, and by what means should they be made?
British India Steam Navigation Company.	Jan. 19, 1889	Submit the opinions of their Marine Superintendents and Commanders.				
Inclosure No. 1. W. H. Aitkinson, Marine Superintendent, Calcutta.	..	Such signals are desirable, but without special training would be of little use.	Knows of no special desire for such a system. The only safe system would be the Morse.	No serious danger, as they would not be much used.	If the system adopted was Morse flashing signals, there need not be any restriction.	Very difficult to make special night danger signals. Experts alone would understand the Morse system, and coloured lights are generally objectionable through risk of confusion with side-lights, but a small number of danger signals might be made with red and white lights.
Inclosure No. 2. G. Stevenson, Master Mariner.	..	Time has arrived for the system to be established.	No knowledge of general demand for such a system, but if one is adopted, the flashing light, with Morse alphabet, is most suitable.	Apprehends no danger on this score.	Pronounced signals, as rockets, blue and red lights, now used as private signals, should be set apart for pilot and danger signals, and arrangements of coloured lights substituted.	
Inclosure No. 3. John J. Lewis, Lieutenant, R.N.R.	..	Time not yet arrived for establishment of such a system.	Has heard of no demand for such a system.	Great danger may arise through inducement to ships to close with each other.	Should be prohibited in English and Irish Channels, and in pilot waters generally.	Night signals should be adopted. Morse telegraph might be used. Steam-whistles by steamers and flashing lanterns by sailing-ships with guns.
Inclosure No. 4. C. R. Kendall, Master Mariner.	..	Night signals should be adopted ..	Flash signals best, as coloured lights are easily mistaken.	It is possible that vessels might close with one another through several reasons.	Can give no answer	Does not know what system should be adopted. It is desirable that special warning signals be instituted.
Inclosure No. 5. A. P. Turner, Master Mariner.	..	Time has arrived for the adoption of such a system.	No general demand for system. Morse flashing signals most convenient.	Dangers would arise from vessels closing.	Restrictions should be made in crowded waters, and their use allowed only in urgent cases.	It is desirable to establish warning signals. Rockets and blue lights best.
Inclosure No. 6. J. R. Gaven, Master Mariner.	..	..	..	Without great prudence there would be danger of vessels closing.	Coloured light signals unnecessary in narrow waters, or where much traffic prevails.	Gun and rocket signals best. Every steamer might carry white, red, and green globe lamps, with which a number of permutations might be made.

Persons, Firms, Societies, &c., applied to for Observations.	Date of Reply.	2. Whether the time has arrived for establishing a system whereby the signals in the International Code Book may be made by night as well as by day?	3. If there is a general demand for such a system, what system should be adopted?	4. If such a system were established, whether any danger is likely to arise therefrom owing to the inducement it might afford to ships to approach one another too closely at night for the purpose of signalling?	5. To report whether there ought to be any, and, if so, what restrictions on the use of night signals, especially in crowded waters?	6. Is it desirable to establish some special warning signals to indicate danger to passing vessels? If so, what should they be, and by what means should they be made?
British India Steam Navigation Company—(*continued*).						
Inclosure No. 7. H. B. Smith, Master Mariner.	..	Time has arrived for night signals to be established.	Great need of system. A simple flashing system, such as used in Royal Navy, best.	No danger would arise from properly established system.	No restrictions should be placed on use of night lights, provided no confusion were possible with lights in common use.	It is absolutely necessary to establish warning signals; if possible, whole International Code of night lights.
Inclosure No. 8. J. P. Livingstone, Master Mariner.	..	Number of night signals insufficient.	Suggests use of "symbols," which would only necessitate three lamps showing colours at present used at sea. The flashing light system is liable to error, and would take too long.	..	Is not in favour of general night signalling in crowded waters.	Warning signals should be introduced.
Inclosure No. 9. E. C. Russell, Master Mariner.	..	It is desirable to establish a system of night signalling, but doubts the safety of such signals.	There is a general demand for such a system, especially in urgent cases. Recommends Colomb's flashing signals.	Danger might arise from signals being misread; no necessity for vessels approaching closely.	Should be restricted to urgent signals in narrow waters.	If any warning signals be used, they must be simple. Colomb's night signals or the Morse Code.
Inclosure No. 10. T. Johnston, Master Mariner.	..	..	..	..	Great danger might arise in crowded waters by use of signals.	A few simple warning signals might be used.
Inclosure No. 11. R. D. Dougherty, Master Mariner.	..	Has no suggestion to offer; thinks present system sufficient.				
Inclosure No. 12. John Beeamy, Master Mariner.	..	Thinks it is not desirable to establish night signalling.	No general demand for any system.	Night signalling would add to danger.	Every restriction should be put on bright light signalling.	Special warning signal might be established by coloured lights on Morse system of flashing signals.
Inclosure No. 13. J. W. Lewins, Master Mariner.	..	Answer in the negative	Answer in the negative.. ..	Sees no danger from this point of view.	Restrictions would be required in narrow waters.	Warning signals would be beneficial.
Inclosure No. 14. T. A. Magennis, Master Mariner.	..	Considers night signalling impracticable and unnecessary.	Thinks demand is not great ..	..	Might prove dangerous in narrow waters.	One or two warning signals beneficial; rockets and blue lights best.

Persons, Firms, Societies, &c., applied to for Observations.	Date of Reply.	2. Whether the time has arrived for establishing a system whereby the signals in the International Code Book may be made by night as well as by day?	3. If there is a general demand for such a system, what system should be adopted?	4. If such a system were established, whether any danger is likely to arise therefrom owing to the inducement it might afford to ships to approach one another too closely at night for the purpose of signalling?	5. To report whether there ought to be any, and, if so, what restrictions on the use of night signals, especially in crowded waters?	6. Is it desirable to establish some special warning signals to indicate danger to passing vessels? If so, what should they be, and by what means should they be made?
British India Steam Navigation Company—(*continued*).						
Inclosure No. 15. A. Hansen, Master Mariner.	..	Sees no necessity for night signalling, except in war times.	No demand	..	Would be dangerous in crowded waters.	A few simple urgent signals desirable by means of rockets and steam whistling on Morse system. Use of rockets as private signals should be disallowed.
Inclosure No. 16. A. W. Mann, Master Mariner.	..	No	No special demand	Would be dangerous	Very dangerous in crowded waters, such as English and Irish Channels, Straits of Gibraltar, &c.	Desirable to adopt the signal, "You are standing into danger," two guns followed by two red plates, one at the bow, other at stern; distant signals to be hoisted at fore and main.
Inclosure No. 17. J. Stone, Master Mariner	..	Time has not yet come	No	Yes	..	A few warning signals might be useful.
Inclosure No. 18. J. Henderson, Master Mariner.	..	This system could not be used on board ships, only from the shore or light-vessels.	..	..	The fewer lights used in crowded waters the better, such as channels off Ushant, Finisterre, Lisbon, &c.	In time of peace no signals are needed; during a war they might be necessary. Suggests flashing lights, using Morse alphabet for letters of International Code.
Inclosure No. 19. A. A. Fyfe, Master Mariner.	..	No general system is advisable ..	Short system, by means of red, green, and white lights, would be of use in cases of emergency.	Night signalling a fruitful source of collision.	Should be restricted to actual cases of necessity.	Is advisable to have something more definite than present distress signals.
Inclosure No. 20. A. E. Withers, Master Mariner.	..	Such a system has long been wanted.	Unable to state; Morse Code by night, and sound.	Good white light with Morse Code best.	With a flashing light restrictions unnecessary in localities named, communications most desirable.	Some urgent signals advisable; proposes two red pyrotechnic lights, vertical, followed by white flashing light in Morse Code.
Inclosure No. 21. James Smith, Master Mariner.	..	Time not yet come	No particular demand; Morse alphabet best.	There would be no occasion for ships to close.	No restrictions necessary ..	Distress signal at present in use would indicate "Need of immediate assistance," "You are standing into danger," and "I have encountered ice," might be adopted by use of rockets and blue lights together, or guns and blue lights together. Signal "I have passed a derelict dangerous to navigation" unnecessary.

Persons, Firms, Societies, &c. applied to for Observations.	Date of Reply.	2. Whether the time has arrived for establishing a system whereby the signals in the International Code Book may be made by night as well as by day?	3. If there is a general demand for such a system, what system should be adopted?	4. If such a system were established, whether any danger is likely to arise therefrom owing to the inducement it might afford to ships to approach one another too closely at night for the purpose of signailing?	5. To report whether there ought to be any, and, if so, what restrictions on the use of night signals, especially in crowded waters?	6. Is it desirable to establish some special warning signals to indicate danger to passing vessels? If so, what should they be, and by what means should they be made?
British India Steam Navigation Company—(*continued*).						
Inclosure No. 22. N. R. Sayers, Master Mariner.	..	Time not yet come	No general demand	Very great danger from collision ..	Dangerous in crowded waters, and ought to be restricted to ships signalling to signal stations only.	Other sentences to indicate danger, distress, or urgency should be used instead of the ones mentioned. Gives Trinity House system, consisting of numbers shown before a box light, as an illustration of what might be done.
Inclosure No. 23. W. H. Hutchinson, Marine Superintendent, London.	..	No special benefit to be derived from establishing night signals for the International Code.	No demand as far as he is aware ..	No particular danger to be apprehended from vessels closing, as no vessels would go out of their way to signal.	In crowded waters night signalling would be a danger in itself.	Present signals quite sufficient, and are thoroughly understood.

Inclosure 6 in No. 143.

Additional Report of the Committee on Sound-Signals.

Sir, *Washington, November* 21, 1889.

AGREEABLY with the reference of the Conference on the 8th November, for the Committee on Sound-Signals to consider and report the specific cases in which new fog-signals should be adopted, and to report specific signals for such cases, we beg to submit that in the opinion of the Committee it is desirable to adopt the sound-signals mentioned in the following Report for compulsory or permissive use as advised.

The sound-signals at present authorized, or adopted by the Conference, to be used during fog, mist, falling snow, or heavy rain, are—

Whistle or Siren.—One long blast of about four seconds' duration, "A steam-vessel under way."

Two such long blasts, "A steam-vessel not at anchor, but stopped and having no way upon her."

Fog-horn.—One blast, "A sailing-vessel on the starboard tack."

Two blasts, "A sailing-vessel on the port tack."

Three blasts, "A sailing-vessel with the wind abaft the beam."

Bell.—Rung continuously for about five seconds, "A vessel at anchor."

One blast on fog-horn and bell rung alternately. To indicate a fishing-vessel off the coast of Europe, north of Cape Finisterre, dredging, employed in line-fishing with her lines out, or using drift-nets and being attached to them.

The sound-signals at present authorized and those adopted by the Conference to be made by steam-vessels when in sight of one another are—

One short blast, "I am directing my course to starboard."

Two short blasts, "I am directing my course to port."

Three short blasts, "I am going full speed astern."

In choosing characters for additional signals the Committee have acted on the principle that—

1. Although efficient mechanical fog-horns, capable of producing sounds of varying duration, are increasing in numbers on board both sailing and fishing vessels, many fog-horns are at present incapable of producing long as well as short sounds.

2. A signal consisting of long sounds is not sufficiently distinctive from one made up of "short" sounds to enable characters consisting of similar sounds, but of different durations, being readily read without liability of mistake. It is only when sounds of different duration are combined in one signal that they are sufficiently distinguishable apart.

3. The sirens of many light-houses and light-vessels sound characteristic high and low notes of different pitch, and this custom is increasing; the Committee, therefore, consider it desirable that such characters should be solely used to distinguish fixed sea or coast dangers; and that all signals made by a moving or stationary sea-going vessel should be characters in one tone or key.

The most unmistakable and easily remembered sound-signals—like those now authorized—consist of a single sound, or a combination of sounds of equal lengths; and the Committee advise the adoption of such characters for any new signals made by one vessel wishing to warn another of her presence, whether she is under way, not under command, or at anchor in a fairway at sea.

One, two, or three sound-blasts on a fog-horn are already in use by sailing-vessels under way.

It is not laid down what the length of these blasts should be, but, by the construction of the fog-horns used in the past, they are necessarily blasts of equal duration; we submit that they should be so regulated, and termed short blasts.

The one, two, or three short blasts on the whistle or siren of a steam-vessel communicating with another vessel, which is in sight of her, might be mistaken for a similar number of sounds on the fog-horn of a sailing-vessel unless the instruments are unmistakably different in tone. And the one "long" blast of a steam-vessel under way in a fog, &c., may, in certain cases, be mistaken for the one "short" blast helm-signal by a steam-vessel; but inasmuch as all these signals have been in use for many years without fault being found with them by mariners, the Committee are not prepared to advise any change in their characters.

The two "long" blasts on a whistle or siren recently adopted by the Conference

to indicate a steam-vessel not at anchor, but stopped and having no way upon her, might in some cases be mistaken for a steam-vessel's two "short" blasts helm-signal to another vessel in sight. To make these signals as distinct as possible the Committee recommend that the words "two such long blasts" should be altered to "two prolonged blasts."

The Conference having provided in Article 13 that a steam-vessel hearing apparently before the beam the fog-signal of a vessel, the position of which is not ascertained, shall, so far as circumstances admit, "stop her engines." We recommend that similar wording should be adopted in Article 12, sec. (*b*).

The Committee are of opinion that it is undesirable to adopt as a character any combination of more than four sounds, either of equal or of varying duration, except they are so numerous and continuous as to be unmistakable.

Acting on this principle, they have chosen the following characters for compulsory use during fog, &c., when another vessel is not in sight:—

Three blasts on a whistle or siren to denote a steam-vessel when her engines are going full speed astern. The Committee recommend the adoption of the above wording in lieu of the present wording in Article 19, "I am going full speed astern."

Two short blasts repeated once, with a short interval between the pair of blasts, on a whistle, siren, or fog-horn, to denote respectively a vessel under steam or sail towing another vessel; and the same character for permissive use to denote also, if necessary, a vessel being towed.

The continuous sounding of any fog-signal, or, while the fog-horns in use are capable only of making single blasts, any number of short blasts greater in number than four, following each other in quick succession on a fog-horn, to denote a vessel in distress.

Considering that it is immaterial to an approaching vessel what the impediment is that she necessarily has to get out of the way of, and that a similar character signal of one blast on the fog-horn alternating with a ring of the bell has long been the authorized and established signal for fishing-boats fishing on the coasts of Europe north of Cape Finisterre, the Committee have chosen two prolonged blasts on a whistle or fog-horn, alternating with the ringing of a bell, to denote a vessel at anchor in a fairway at sea, and have adopted the same character to denote a vessel not under command.

The Committee are informed that in the London river four short blasts on a steam-vessel's whistle denote that the steam-vessel is unable to comply with the regulations and alter course to get out of the way of a neighbouring vessel which is in sight in consequence of being dangerously near the side of a narrow channel-way, and the steam-vessel thereby demands that the other vessel should get out of her way. Such being the case, they have considered it unadvisable to adopt the same character as a signal for another purpose at sea.

The characters referred to above practically exhaust the combination of easily remembered sounds of equal duration, and it follows that for further signals, characters combining long and short sounds must be chosen.

The Committee consider it desirable to distinguish the few special "communication" signals asked for by mariners from the warning or danger-signals by adopting combination characters commencing with a short sound, and on this principle they have chosen the characters mentioned below.

Short, long, short; — ——— — to denote "My engines are stopped; you may feel your way past me."

Short, short, long; — — ——— to denote "A pilot-vessel;" or, "I want a pilot."

We are of opinion that Article 12, prescribing what sound-signals apparatus should be carried by vessels, should be limited to vessels above 20 tons gross tonnage—smaller sailing-vessels and boats being allowed to make any efficient sound-signal.

We have received evidence that improved mechanical fog-horns are now obtainable at a reasonable expense, and that such horns are largely used; especially is this the case on board of the vessels fishing on the Banks of Newfoundland, where, in addition to the safety of the vessel, the interests of those engaged in fishing are increased in accordance with an increase in the efficiency of their fog-horns, which are used for signalling to their outlying boats when fishing at a distance from the parent vessel.

With a view to insuring as much as possible the efficiency of all fog-horns, we recommend that the words "a bellows or other," in Article 12, be eliminated in order to prevent as much as possible the use of inferior instruments.

In agreement with the decision already come to by the Conference, we recommend the use of a gong in lieu of a bell in Chinese and other waters where such instruments are in common use on board vessels; but inasmuch as a large number of light-vessels in other waters use such instruments to sound a special signal indicating their position

as a warning mark defining a neighbouring sea danger, the Committee invite the consideration of the Conference to the desirability of not allowing a gong to be used in such waters.

In accordance with our recommendations as above, we suggest for the consideration of the Conference the following readings of the Articles in the Regulations :—

Addition to Article 9. A pilot-vessel wishing to attract attention may sound on her fog-horn, whistle, or siren, three blasts, viz., short, short, long, with intervals of about one second between them.

Article 10 (*k*). In fog, mist, falling snow, or heavy rain-storms, a drift-net vessel attached to her nets, and a vessel when trawling, dredging, or fishing with any kind of drag-net, and a vessel employed in line-fishing with their lines out, shall at intervals of not more than two minutes make a blast with her fog-horn, followed by ringing her bell.

Sound-Signals for Fog, &c.

Article 12. A steam-ship shall be provided with a whistle or siren, sounded by steam, or other efficient substitute for steam, so placed that the sound may not be intercepted by any obstructions, and with an efficient fog-horn to be sounded by mechanical means, and also with an efficient bell.* A sailing-vessel of 20 tons gross tonnage and upwards shall be provided with a similar fog-horn and bell.

Sailing-vessels and boats of less than 20 tons gross tonnage shall not be obliged to be provided with a mechanical fog-horn, but if not so provided they shall make with any other instrument an efficient sound-signal at intervals of not more than two minutes.

Article 12—(*b*.) A steam-vessel not at anchor, but with engines stopped, shall sound, at intervals of not more than two minutes, two prolonged blasts with an interval of about one second between them.

(*e*.) A steam-vessel, when her engines are going full speed astern, shall sound on her whistle three short blasts.

(*f*.) A vessel, if a steam-vessel, at anchor in a fairway at sea, shall, at intervals of not more than two minutes, sound two prolonged blasts with her whistle or siren, followed by ringing her bell; or, if a sailing-vessel, two blasts with her fog-horn, followed by ringing her bell.

(*g*.) A steam-vessel and a sailing-vessel when towing shall, and the vessel towed may if necessary, at intervals of not more than two minutes, sound on the whistle, siren, or fog-horn four short blasts sounded in pairs, the first two being separated from the last two by an interval of slightly longer duration than the intervals between the first and second blasts and the third and fourth blasts.

(*h*.) A steam-vessel wishing to indicate to another, "My engines are stopped, you may feel your way past me," may sound on her whistle or siren three blasts, viz., short, long, short, with intervals of about one second between them.

Pilot Signals.

Sec. 3. A vessel wanting a pilot may sound on her fog-horn, whistle, or siren three blasts in succession, viz., short, short, long, with intervals of about one second between them.

Sound-Signals for Vessels in Sight of one another.

Article 19. In taking any course authorized or required by these Regulations, a steam-vessel under way shall indicate that course to any other ship which she has in sight by the following signals on her whistle or other steam sound-signal, viz. :—

One short blast to mean, "I am directing my course to starboard."

Two short blasts to mean, "I am directing my course to port."

Three short blasts to mean, "My engines are going full speed astern."

Lights and Signals to attract Attention.

Article . Every ship may, if necessary, in order to attract attention, in addition to the lights which she is by these Regulations required to carry, show a flare-up light, or use any detonating signal that cannot be mistaken for a distress signal.

* In all cases where the Regulations require a bell to be used, a drum will be substituted on board Turkish vessels, and a gong in Chinese waters where such articles are commonly used on board small sea-going vessels.

Distress Signals.

Article 27. When a ship is in distress and requires assistance from other ships or from the shore, the following shall be the signals to be used or displayed by her, either together or separately; that is to say:—

In the daytime—

1. A gun fired at intervals of about a minute;
2. The International Code signal of distress indicated by NC;
3. The distant signal, consisting of a square flag, having either above or below it a ball or anything resembling a ball;
4. Rockets or shells bursting in the air with a loud report, and throwing stars of any colour or description, fired one at a time at short intervals.
5. A continuous sounding with any fog-signal apparatus.

At night—

1. A gun fired at intervals of about a minute;
2. Flames on the ship (as from a burning tar-barrel, oil-barrel, &c.);
3. Rockets or shells, as described under day-signals.
4. A continuous sounding with any fog-signal apparatus.

President of the International Marine Conference, &c.

Inclosure 7 in No. 143.

Report of Committee on Systems and Devices.

Sir, *Washington, October* 31, 1889.

IN compliance with a Resolution made by the Maritime Conference, we have consdered all systems and devices which have been laid before us up to the 30th instant, on wihich day, in accordance with the ruling of the said Conference, we closed our examination, and do now report as follows:—

We have considered thirty-seven different proposals on night signalling, &c., at sea, but whilst glad to notice that this important subject is receiving so much attention, and thanking the authors of the various systems for their trouble, we have not seen any plan equal to the Morse, which is already in use in many navies, including those of the United States, France, and Great Britain.

This system necessitates the employment of a trained signalman, but is otherwise inexpensive, as it only requires one flashing lamp for night work, and the steam-whistle or other sound-signal for fog. It can also be used with or without a Code Book.

Ten papers on preventing collisions at sea have become before us, but we do not consider it necessary to lay them before Conference.

We have examined twenty-five papers on various subjects, and consider that those numbered 2, 5, 9, 17, 20, and 25, under Miscellaneous, are interesting. The sheets showing the manœuvring powers of ships under various speeds, and numbered 20, are well worth the attention of every one interested in this subject.

The Committee are of opinion that considering the importance of Division V, "Saving Life and Property at Sea," and a number of devices which have been presented, it would appear desirable to appoint a Special Committee to consider that subject, composed, as far as possible, of Delegates who have made a study of the matter, and therefore the propositions dealing with "Life-Saving Apparatus" have not been considered.

Furthermore, it might be necessary, in some cases, to carry out some practical experiments.

We inclose herewith Forms showing the subjects dealt with, the names of the author or inventor, and our remarks thereon.

MISCELLANEOUS SUBJECTS.

No.	Name and Address of Writer.	Subject.	Remarks of Committee.
1	Bainbridge-Hoff, Commander U. S. N., Washington.	Letter proposing list of subjects to be considered by Conference.	Already disposed of. No action necessary.
2	Littlehales, Division of Chart Construction, Washington.	Referring to Divisions I, II, X, and XI of Conference.	Might be read to the Conference when those subjects are considered.
	Letters on similar subjects from C. M. McCarteneny and S. W. Wetzel, Lieuts. U. S. N.; also from Mrs. Kerrle.	Referring to Divisions I, II, X, XI, and XII.	Might be read when those subjects are considered, except paper on Division I, which is not necessary.
3	Consul Catlin, of Zurich ..	Proposing a Swiss maritime flag..	Not within scope of the Conference.
4	John C. Morgan, Philadelphia	Various matters	Examined.
5	Northern Maritime Conference, Copenhagen.	Memorandum, with pamphlet on the general subjects of programme.	Pamphlet should be distributed to the members of the Conference.
6	F. Della Torre, Baltimore ..	Letter and plan relating to Division X.	Examined.
7	A. L. Woodworth, Virginia Ironworks, Norfolk, Va.	Automatic alarm-buoy	Examined.

No.	Name and Address of Writer.	Subject.	Remarks of Committee.
8	Major A. Stewart Harrison, London.	Sound Stella signals: night, day, and fog.	Examined.
9	Lieut. M. L. Wood, U. S. N. .	International buoyage	Appears to be a well-considered and simple system.
10	S. A. Philipsen, Copenhagen..	International buoyage	An account of systems now in existence, and suggestions.
11	I. Leveille, Montreal ..	Additional improved safety rudder	Does not come within scope of Conference.
12	R. W. Allen	A jury-rudder	Not within the scope of Conference.
13	Report of U. S. Naval Engineers.	Combined rudder and swivelling screw.	Not within the scope of Conference.
14	N. H. Borgfeldt, Brooklyn ..	Nautical distance indicator for use in fog.	Examined.
15	S. N. Carvalho, New York. ..	Plan for dissipating fog by flames of carbonized oxy-hydrogen gas.	Not within scope of Conference, no experiments having been reported.
16	M. E. Chamberlain.. ..	Suggests firing coloured rockets to avoid collision.	Examined.
17	James Lawson, London ..	Lamp for the masthead, fitted with red and green shades, capable of being worked from the deck to indicate which side it is intended to approach a vessel.	Might be laid before Conference if any system of helm-signals is adopted.
18	Various writers. No covering letter.	Various matters	Examined.
19	Capt. P. Talbot Peterson, New York.	A running commentary on the Rules and other topics in connection with the Conference.	Examined.
20	Captain W. J. L. Warton, R.N., London.	Charts, with Tables showing the manœuvring powers of ships.	Worth the consideration of every one interested in this subject.
21	.. ..	Bundle of papers bearing on every subject before the Conference.	These papers were presented to us the last day of our sitting, having been previously considered by the Committees on Lights and Fog Signals, and as some of them appear to contain matters of interest, we would recommend their being placed at the disposal of the members of the Conference.
22	American Ship Windlass Co., Providence, R. I.	Referring to steam capstan, windlasses, &c.	Not within scope of the Conference.
23	H. B. Case, New Haven, Conn.	Proposing a new system of lamps and electric buoy.	Committee cannot pronounce an opinion without seeing them at sea.
24	John Spiers, by Watson and Hagen, New York.	Proposition for stopping leaks in vessels built of iron or steel.	Not within scope of the Conference.
25	Curtis Tilton, Philadelphia ..	White flash stern-light, with model.	Worth the consideration of Conference if occulting stern-light is introduced, but we would prefer that the occultation was made by a shade.

Inclosure 8 in No. 143.

Report of Committee on Lights for Small Craft.

Sir, *Washington, November* 8, 1889.

THE Committee on Lights for Small Craft, pursuant to the Resolution adopted by the Marine Conference instructing the said Committee to consider and report as to Rules for the lights to be carried or shown on small vessels, pilot-vessels, and fishing-vessels, have agreed upon a Report, which, having adopted unanimously, or by a majority of votes, they respectfully submit, in the form of proposed amendments to the present International Regulations.

The Committee are unanimously of opinion that the part of the present Article 10, which precedes sub-section (*a*), applying to fishing-vessels and boats when in the sea off the coast of Europe, lying north of Cape Finisterre, should be omitted. The amendments submitted are therefore proposed as applicable to all waters without distinction.

(Signed) THOMAS GRAY, *Chairman.*
THO. VERBRUGGHE, *Delegate for Belgium.*
A. M. BISBEE, *Delegate from China.*
AUG. SCHNEIDER, *Delegate from Denmark.*
HENRI LANNÉLUC, *Delegate for France.*
CHR. DONNER, *Delegate from Germany.*
R. BABA, *Delegate from Japan.*
D. HUBERT, *Delegate from the Netherlands.*
JAS. W. NORCROSS, *Delegate from the United States.*

To Rear-Admiral S. R. Franklin, United States' Navy,
President of the International Marine Conference, &c.

Article 7. Whenever, as in the case of small vessels under way during bad weather, the green and red side-lights cannot be fixed, these lights shall be kept at hand, ready for use; and shall, on the approach of or to other vessels, be exhibited on their respective sides in sufficient time to prevent collision, in such manner as to make them most visible, and so that the green light shall not be seen on the port side, nor the red light on the starboard side, nor if practicable more than two points abaft the beam on their respective sides.

To make the use of these portable lights more certain and easy, the lanterns containing them shall each be painted outside with the colour of the light they respectively contain, and shall be provided with proper screens.

Article 8. No alteration.

Article 9.—(*a.*) A pilot-vessel, whether under sail or steam, when engaged on her station on pilotage duty, shall not show the lights required for other vessels, but shall carry a white light at the masthead, visible all round the horizon, and shall also exhibit a flare-up light or flare-up lights at short intervals, which shall never exceed fifteen minutes.

When approaching a vessel to put a pilot on board, or when there is risk of collision with another vessel, such pilot-vessel shall have at hand two lights, one red and one green, so constructed that they can be flashed instantaneously, which shall be kept either in their places, screened, or on deck on their respective sides of the vessel, always ready for use, and shall flash one of them (in order to show the direction in which she is heading) in sufficient time to prevent collision, so that the red light shall only be shown on the port side, and the green light only on the starboard side.

(*b.*) A pilot-vessel of such a class as to be obliged to go alongside of a vessel to put a pilot on board may show a white light instead of carrying a white light at the masthead.

(*c.*) A pilot-vessel, whether under sail or steam, when not engaged on her station on pilotage duty, shall carry lights similar to those of other vessels.

Article 10. Paragraph (*a*) of this Article applies only to boats and vessels propelled by sails or oars of less than 20 tons gross tonnage, and only to such boats and vessels when they are under way. It therefore applies also to fishing-vessels of less than 20 tons gross tonnage, when they are not actually engaged in fishing, but are under way.

(*a.*) Boats and vessels of less than 20 tons gross tonnage shall not be obliged to carry

the coloured side-lights; but every such boat and vessel shall, if she do not carry such coloured side-lights, have ready at hand a lantern with a green glass on the one side, and a red glass on the other side, and on approaching to or being approached by another vessel such lantern shall be exhibited in sufficient time to prevent collision, so that the green light shall not be seen on the port side, nor the red light on the starboard side.

Note.—Paragraph (*b*) of this Article applies only to vessels under steam of less than 40 tons gross tonnage, and only to such vessels when they are under way. It therefore applies also to fishing-vessels under steam of less than 40 tons gross tonnage when they are not actually engaged in fishing, but are under way.

(*b.*) A vessel of less than 40 tons gross tonnage when under steam shall not be obliged to carry the lights prescribed for other vessels under steam, but if she does not carry such lights she shall carry on or in front of her foremast, or on or in front of her funnel or somewhere in the fore part of the vessel where it can best be seen, and at a height above the gunwale of not less than 9 feet, a bright white light visible for at least 2 miles, so constructed as to show over an arc of the horizon of 20 points of the compass, so fixed as to throw the light 10 points on each side of the vessel, namely, from right ahead to 2 points abaft the beam on either side; and such vessel shall further carry either (1) side-lights visible for at least 1 mile, or (2) a lantern with a green glass on the one side, and a red glass on the other, so constructed that it will show an unbroken green light over an arc of the horizon of ten points of the compass from right ahead to two points abaft the beam on the starboard side, and an unbroken red light over an arc of the horizon of 10 points of the compass from right ahead to 2 points abaft the beam on the port side. This lantern shall be carried at not less than 3 feet below the white light before mentioned.

Article .—(*a.*) All fishing-vessels and fishing-boats of 20 tons gross tonnage, or upwards, when under way and when not required by the following Regulations in this Article to carry and show the lights therein named, shall carry and show the same lights as other vessels under way.

(*b.*) All vessels and boats when engaged in fishing with drift-nets shall exhibit two white lights from any part of the vessel where they can be best seen. Such lights shall be placed so that the vertical distance between them shall be not less than 6 feet and not more than 10 feet, and so that the horizontal distance between them measured in a line with the keel of the vessel shall be not less than 5 feet and not more than 10 feet. The lower of these two lights shall be the more forward, and both of them shall be of such a character and contained in lanterns of such construction as to show all round the horizon, on a dark night, with a clear atmosphere, for a distance of not less than 3 miles.

Note.—The following sub-sections (*c*) and (*d*) and (*e*) of this Article only apply to vessels engaged in trawl-fishing, by which is meant the dragging of an apparatus along the bottom of the sea attached to any vessel in motion.

(*c.*) All vessels under steam when engaged in trawling, having their trawls in the water, and not being stationary in consequence of their gear getting fast to a rock or other obstruction, shall carry on or in front of the foremast, and in the same position as the white light which other steam-ships are required to carry, a lantern showing a white light ahead, a green light on the starboard side, and a red light on the port side, such lantern to be so constructed, fitted, and arranged as to show an unbroken white light over an arc of the horizon of four points of the compass, an unbroken green light over an arc of the horizon of ten points of the compass, and an unbroken red light over an arc of the horizon of ten points of the compass, and it shall be so fixed as to show the white light from right ahead to two points on the bow on each side of the vessel, the green light from two points on the starboard bow to four points abaft the beam on the starboard side, and the red light from two points on the port bow to four points abaft the beam on the port side. Such vessels shall also carry a white light, in a lantern so constructed as to show a clear and unbroken light all round the horizon, the lantern containing such white light to be carried lower than the lantern showing the green, white, and red lights, as aforesaid, so however that the actual distance between them shall not be less than 6 feet nor more than 12 feet.

(*d.*) All sailing-vessels of 7 tons gross tonnage and upwards, engaged in trawling, having their trawl in the water, and not being stationary in consequence of their gear getting fast to a rock or other obstruction, shall carry from sunset to sunrise a white light, in a lantern so constructed as to show a clear and unbroken light all round the horizon, and also provide a sufficient supply of red pyrotechnic lights, which shall each burn for at least 30 seconds, and shall, when so burning, be visible for the same distance under the same conditions as the white light. The white light shall be shown from sunset to sunrise, and one of the pyrotechnic lights shall be shown on approaching to or being approached by another vessel, in sufficient time to prevent collision.

All lights mentioned above shall be visible at a distance of 2 miles.

(*e.*) Sailing-vessels of less than 7 tons gross tonnage ennaged in trawling, having their trawl in the water, and not being stationary in consequence of their gear getting fast to a rock or other obstruction, shall not be obliged to carry the white light mentioned in section (*d*) of this Article, but if they do not carry such light, they shall have at hand a lantern showing a bright white light, and shall, on approaching to or being approached by another vessel, exhibit it where it can best be seen, in sufficient time to prevent collision; and instead of showing a red pyrotechnic light they may show a flare-up light.

(*f.*) All vessels and boats when employed in line-fishing with their lines out and attached to their lines, and when not at anchor or stationary, shall carry the same lights as vessels when engaged in fishing with drift-nets.

(*g.*) If a vessel or boat when fishing becomes stationary in consequence of her gear getting fast to a rock or other obstruction, she shall show the light and make the fog-signal for a vessel at anchor.

(*h.*) Fishing-vessels and boats may at any time use a flare-up in addition to the lights which they are by this Article required to carry and show. All flare-up lights exhibited by a vessel when trawling or fishing with any kind of drag-net shall be shown at the after part of the vessel, excepting that, if the vessel is hanging by the stern to her fishing gear, the flare-up lights shall be exhibited from the bow.

(*i.*) Every fishing-vessel and every boat when at anchor between sunset and sunrise shall exhibit a white light visible all round the horizon at a distance of at least 1 mile.

(*k.*) Fog-signals not discussed.

Inclosure 9 in No. 143.

Final Report of the Committee on Collocation of the Rules.

Sir, *Washington, D.C.*

IN compliance with the Resolution passed by the Conference on the 20th instant, your Committee have completed their former Report by embodying into the Regulations and Notes the changes and additions recently adopted by the Conference.

The final Regulations and Notes, as revised by your Committee, are hereto annexed in Appendices (A) and (B), respectively.

We have, &c.

(Signed) WM. W. GOODRICH, *Chairman* (United States).
Rear-Admiral DE SPAUN (Austria-Hungary).
DR. SIEVEKING (Germany).
CHARLES HALL (Great Britain).
S. TSUKAHARA (Japan).
Commodore MONASTERIO (Mexico).
Captain SALVESEN (Norway).
Vice-Admiral KAZNAKOFF (Russia).

To Rear-Admiral Samuel R. Franklin, United States' Navy,
President of the International Marine Conference, &c.

Appendix (A).

REGULATIONS FOR PREVENTING COLLISIONS AT SEA.

Preliminary.

THESE Rules shall be followed by all vessels upon the high seas and in all waters connected therewith, navigable by sea-going vessels.

In the following Rules every steam-vessel which is under sail and not under steam is to be considered a sailing-vessel, and every vessel under steam, whether under sail or not, is to be considered a steam-vessel.

The word "steam-vessel" shall include any vessel propelled by machinery.

A vessel is "under way" within the meaning of these Rules when she is not at anchor, or made fast to the shore, or aground.

The word "visible" in these Rules when applied to lights shall mean visible on a dark night, with a clear atmosphere.

Article 1. The Rules concerning lights shall be complied with in all weathers from sunset to sunrise, and during such time no other lights which may be mistaken for the prescribed lights shall be exhibited.

Art. 2. A steam-vessel when under way shall carry—

(*a.*) On or in front of the foremast, or if a vessel without a foremast, then in the fore part of the vessel, at a height above the hull of not less than 20 feet, and if the breadth of the vessel exceeds 20 feet, then at a height above the hull not less than such breadth, so, however, that the light need not be carried at a greater height above the hull than 40 feet, a bright white light, so constructed as to show an unbroken light over an arc of the horizon of 20 points of the compass, so fixed as to throw the light 10 points on each side of the vessel, viz., from right ahead to 2 points abaft the beam on either side, and of such a character as to be visible at a distance of at least 5 miles.

(*b.*) On the starboard side a green light so constructed as to show an unbroken light over an arc of the horizon of 10 points of the compass, so fixed as to throw the light from right ahead to 2 points abaft the beam on the starboard side, and of such a character as to be visible at a distance of at least 2 miles.

(*c.*) On the port side a red light so constructed as to show an unbroken light over an arc of the horizon of 10 points of the compass, so fixed as to throw the light from right ahead to 2 points abaft the beam on the port side, and of such a character as to be visible at a distance of at least 2 miles.

(*d.*) The said green and red side-lights shall be fitted with inboard screens projecting at least 3 feet forward from the light, so as to prevent these lights from being seen across the bow.

(*e.*) A steam-vessel when under way may carry an additional white light similar in construction to the light mentioned in subdivision (*a*). These two lights shall be so placed in line with the keel that one shall be at least 15 feet higher than the other, and in such a position with reference to each other that the lower light shall be forward of the upper one. The vertical distance between these lights shall be less than the horizontal distance.

Art. 3. A steam-vessel when towing another vessel shall, in addition to her side-lights, carry two bright white lights in a vertical line one over the other, not less than 6 feet apart, and when towing more than one vessel shall carry an additional bright white light 6 feet above or below such lights, if the length of the tow measuring from the stern of the towing vessel to the stern of the last vessel towed exceeds 600 feet. Each of these lights shall be of the same construction and character, and shall be carried in the same position as the white light mentioned in Article 2 (*a*), excepting the additional light, which may be carried at a height of not less than 14 feet above the hull.

Such steam-vessel may carry a small white light abaft the funnel or aftermast for the vessel towed to steer by, but such light shall not be visible forward of the beam.

Art. 4.—(*a.*) A vessel which from any accident is not under command shall carry at the same height as the white light mentioned in Article 2 (*a*), where they can best be seen, and if a steam-vessel, in lieu of that light, two red lights, in a vertical line one over the other, not less than 6 feet apart, and of such a character as to be visible all round the horizon at a distance of at least 2 miles; and shall by day carry in a vertical line one over the other, not less than 6 feet apart, where they can best be seen, two black balls or shapes, each 2 feet in diameter.

(*b.*) A vessel employed in laying or in picking up a telegraph cable shall carry in the same position as the white light mentioned in Article 2 (*a*), and if a steam-vessel, in lieu of that light, three lights in a vertical line one over the other, not less than 6 feet apart. The highest and lowest of these lights shall be red, and the middle light shall be white, and they shall be of such a character as to be visible all round the horizon, at a distance of at least 2 miles. By day she shall carry in a vertical line one over the other, not less than 6 feet apart, where they can best be seen, three shapes not less than 2 feet in diameter, of which the highest and lowest shall be globular in shape and red in colour, and the middle one diamond in shape and white.

(*c.*) The vessels referred to in this Article, when not making way through the water, shall not carry the side-lights, but when making way shall carry them.

(*d.*) The lights and shapes required to be shown by this Article are to be taken by other vessels as signals that the vessel showing them is not under command, and cannot therefore get out of the way.

These signals are not signals of vessels in distress and requiring assistance. Such signals are contained in Article 31.

Art 5. A sailing-vessel under way, and any vessel being towed, shall carry the same lights as are prescribed by Article 2 for a steam-vessel under way, with the exception of the white lights mentioned therein, which they shall never carry.

Art. 6. Whenever, as in the case of small vessels under way during bad weather, the green and red side-lights cannot be fixed, these lights shall be kept at hand, lighted and ready for use; and shall, on the approach of or to other vessels, be exhibited on their respective sides in sufficient time to prevent collision, in such manner as to make them most visible, and so that the green light shall not be seen on the port side, nor the red light on the starboard side, nor if practicable more than two points abaft the beam on their respective sides.

To make the use of these portable lights more certain and easy, the lanterns containing them shall each be painted outside with the colour of the light they respectively contain, and shall be provided with proper screens.

Art. 7. Steam-vessels of less than 40, and vessels under oars or sails, of less than 20 tons, gross tonnage, respectively, when under way, shall not be obliged to carry the lights mentioned

in Article 2 (*a*), (*b*), and (*c*), but if they do not carry them they shall be provided with the following lights:—

1. Steam-vessels of less than 40 tons shall carry—

(*a.*) In the fore part of the vessel, or on or in front of the funnel, where it can best be seen, and at a height above the gunwale of not less than 9 feet, a bright white light constructed and fixed as prescribed in Article 2 (*a*), and of such a character as to be visible at a distance of at least 2 miles.

(*b.*) Green and red side-lights constructed and fixed as prescribed in Article 2 (*b*) and (*c*), and of such a character as to be visible at a distance of at least 1 mile, or a combined lantern showing a green light and a red light from right ahead to 2 points abaft the beam on their respective sides. Such lantern shall be carried not less than 3 feet below the white light.

2. Small steam-boats, such as are carried by sea-going vessels, may carry the white light at a less height than 9 feet above the gunwale, but it shall be carried above the combined lantern mentioned in subdivision 1 (*b*).

3. Vessels under oars or sails, of less than 20 tons, shall have ready at hand a lantern with a green glass on one side, and a red glass on the other, which, on the approach of or to other vessels, shall be exhibited in sufficient time to prevent collision, so that the green light shall not be seen on the port side, nor the red light on the starboard side.

The vessels referred to in this Article shall not be obliged to carry the lights prescribed by Article 4 (*a*), and Article 11, last paragraph.

Art. 8. Pilot-vessels when engaged on their station on pilotage duty shall not show the lights required for other vessels, but shall carry a white light at the masthead, visible all round the horizon, and shall also exhibit a flare-up light or flare-up lights at short intervals, which shall never exceed 15 minutes.

On the near approach of or to other vessels they shall have their side-lights lighted ready for use, and shall flash or show them at short intervals, to indicate the direction in which they are heading, but the green light shall not be shown on the port side, nor the red light on the starboard side.

A pilot-vessel of such a class as to be obliged to go alongside of a vessel to put a pilot on board may show the white light instead of carrying it at the masthead, and may, instead of the coloured lights above mentioned, have at hand ready for use a lantern with a green glass on the one side, and a red glass on the other, to be used as prescribed above.

Pilot-vessels when not engaged on their station on pilotage duty shall carry lights similar to those of other vessels of their tonnage.

Art. 9. Fishing-vessels and fishing-boats when under way, and when not required by this Article to carry or show the lights therein named, shall carry or show the lights prescribed for vessels of their tonnage under way.

(*a.*) Vessels and boats when fishing with drift-nets shall exhibit two white lights from any part of the vessel where they can best be seen. Such lights shall be placed so that the vertical distance between them shall be not less than 6 feet and not more than 10 feet, and so that the horizontal distance between them, measured in a line with the keel, shall be not less than 5 feet and not more than 10 feet. The lower of these two lights shall be the more forward, and both of them shall be of such a character as to show all round the horizon, and to be visible at a distance of not less than 3 miles.

(*b.*) Vessels when engaged in trawling, by which is meant the dragging of an apparatus along the bottom of the sea—

1. If steam-vessels, shall carry in the same position as the white light mentioned in Article 2 (*a*) a tricoloured lantern so constructed and fixed as to show a white light from right ahead to 2 points on each bow, and a green light and a red light over an arc of the horizon from 2 points on either bow to 2 points abaft the beam on the starboard and port side respectively; and not less than 6 nor more than 12 feet below the tricoloured lantern, a white light in a lantern, so constructed as to show a clear, uniform, and unbroken light all round the horizon.

2. If sailing-vessels of 7 tons gross tonnage and upwards, shall carry white light in a lantern, so constructed as to show a clear, uniform, and unbroken light all round the horizon, and shall also be provided with a sufficient supply of red pyrotechnic lights, which shall each burn for at least 30 seconds, and shall be shown on the approach of or to other vessels in sufficient time to prevent collision.

In the Mediterranean Sea, the vessels referred to in subdivision (*b*) 2 may use a flare-up light in lieu of a pyrotechnic light.

All lights mentioned in subdivision (*b*) 1 and 2 shall be visible at a distance of at least 2 miles.

3. If sailing-vessels of less than 7 tons gross tonnage, shall not be obliged to carry the white light mentioned in subdivision (*b*) 2 of this Article, but if they do not carry such light, they shall have at hand, ready for use, a lantern showing a bright white light, which shall, on the approach of or to other vessels, be exhibited where it can best be seen, in sufficient time to prevent collision; and they shall also show a red pyrotechnic light, as prescribed in subdivision (*b*) 2, or in lieu thereof a flare-up light.

(*c.*) Vessels and boats when line-fishing with their lines out and attached to their lines, and when not at anchor or stationary, shall carry the same lights as vessels fishing with drift-nets.

(*d.*) Fishing-vessels and fishing-boats may at any time use a flare-up light in addition to the lights which they are by this Article required to carry and show. All flare-up lights exhibited by a vessel when trawling or fishing with any kind of drag-net shall be shown at the after part of the vessel, excepting that, if the vessel is hanging by the stern to her fishing gear, they shall be exhibited from the bow.

(*e.*) Every fishing-vessel and every boat when at anchor shall exhibit a white light visible all round the horizon at a distance of at least 1 mile.

(*f.*) If a vessel or boat when fishing becomes stationary in consequence of her gear getting fast to

a rock or other obstruction, she shall show the light and make the fog-signal prescribed for a vessel at anchor, respectively. (See Article 15 (*d*), (*e*), and last paragraph.)

(*g*.) In fog, mist, falling snow, or heavy rain-storms, drift-net vessels attached to their nets, and vessels when trawling, dredging, or fishing with any kind of drag-net, and vessels line-fishing with their lines out, shall, if of 20 tons gross tonnage or upwards, respectively, at intervals of not more than 1 minute, make a blast; if steam-vessels with the whistle or siren, and if sailing-vessels with the fog horn, each blast to be followed by ringing the bell.

(*h*.) Sailing-vessels or boats fishing with nets or lines or trawls, when under way, shall in daytime indicate their occupation to an approaching vessel by displaying a basket or other efficient signal, where it can best be seen.

The vessels referred to in this Article shall not be obliged to carry the lights prescribed by Article 4 (*a*), and Article 11, last paragraph.

Art. 10. A vessel which is being overtaken by another shall show from her stern to such last-mentioned vessel a white light or a flare-up light.

The white light required to be shown by this Article may be fixed and carried in a lantern, but in such case the lantern shall be so constructed, fitted, and screened that it shall throw an unbroken light over an arc of the horizon of 12 points of the compass, viz., for 6 points from right aft on each side of the vessel, so as to be visible at a distance of at least 1 mile. Such light shall be carried as nearly as practicable on the same level as the side-lights.

Art. 11. A vessel under 150 feet in length, when at anchor, shall carry forward, where it can best be seen, but at a height not exceeding 20 feet above the hull, a white light in a lantern, so constructed as to show a clear, uniform, and unbroken light, visible all round the horizon at a distance of at least 1 mile.

A vessel of 150 feet or upwards in length, when at anchor, shall carry in the forward part of the vessel, at a height of not less than 20 and not exceeding 40 feet above the hull, one such light, and at or near the stern of the vessel, and at such a height that it shall be not less than 15 feet lower than the forward light, another such light.

The length of a vessel shall be deemed to be the length appearing in her certificate of registry.

A vessel aground in or near a fairway shall carry the above light or lights, and the two red lights prescribed by Article 4 (*a*).

Art. 12. Every vessel may, if necessary in order to attract attention, in addition to the lights which she is by these Rules required to carry, show a flare-up light or use any denotating signal that cannot be mistaken for a distress signal.

Art. 13. Nothing in these Rules shall interfere with the operation of any special Rules made by the Government of any nation, with respect to additional station and signal-lights for two or more ships of war or for vessels sailing under convoy, or with the exhibition of recognition signals adopted by ship-owners, which have been authorized by their respective Governments and duly registered and published.

Art. 14. A steam-vessel proceeding under sail only, but having her funnel up, shall carry in daytime, forward, where it can best be seen, one black ball or shape 2 feet in diameter.

Sound-Signals for Fog, &c.

Art. 15. All signals prescribed by this Article for vessels under way shall be given:—

1. By "steam-vessels" on the whistle or siren.
2. By "sailing-vessels and vessels towed" on the fog-horn.

The words "prolonged blast" used in this Article shall mean a blast of from 4 to 6 seconds' duration.

A steam-vessel shall be provided with an efficient whistle or siren, sounded by steam or some substitute for steam, so placed that the sound may not be intercepted by any obstruction, and with an efficient fog-horn, to be sounded by mechanical means, and also with an efficient bell.* A sailing-vessel of 20 tons gross tonnage or upwards shall be provided with a similar fog-horn and bell.

In fog, mist, falling snow, or heavy rain-storms, whether by day or night, the signals described in this Article shall be used as follows, viz.:—

(*a*.) A steam-vessel having way upon her shall sound, at intervals of not more than 2 minutes, a prolonged blast.

(*b*.) A steam-vessel under way, but stopped and having no way upon her, shall sound, at intervals of not more than 2 minutes, two prolonged blasts, with an interval of about 1 second between them.

(*c*.) A sailing-vessel under way shall sound, at intervals of not more than 1 minute, when on the starboard tack, one blast, when on the port tack, two blasts in succession, and when with the wind abaft the beam, three blasts in succession.

(*d*.) A vessel, when at anchor, shall, at intervals of not more than 1 minute, ring the bell rapidly for about 5 seconds.

(*e*.) A vessel, at anchor at sea, when not in ordinary anchorage ground, and when in such a position as to be an obstruction to vessels under way, shall sound, if a steam-vessel, at intervals of not more than 2 minutes, two prolonged blasts with her whistle or siren, followed by ringing her bell; or if a sailing-vessel, at intervals of not more than 1 minute, two blasts with her fog-horn, followed by ringing her bell.

(*f*.) A vessel, when towing, shall, instead of the signals prescribed in subdivisions (*a*) and (*c*) of this Article, at intervals of not more than 2 minutes, sound three blasts in succession, viz., one prolonged blast, followed by two short blasts. A vessel towed may give this signal, and she shall not give any other.

* *Note.*—In all cases where the Rules require a bell to be used a drum may be substituted on board Turkish vessels, or a gong where such articles are used on board small sea-going vessels.

(*g.*) A steam-vessel wishing to indicate to another, "The way is off my vessel, you may feel your way past me," may sound three blasts in succession, viz., short, long, short, with intervals of about 1 second between them.

(*h.*) A vessel employed in laying or in picking up a telegraph cable shall, on hearing the fog-signal of an approaching vessel, sound in answer three prolonged blasts in succession.

(*i.*) A vessel under way, which is unable to get out of the way of an approaching vessel through being not under command, or unable to manœuvre as required by these Rules, shall, on hearing the fog-signal of an approaching vessel, sound in answer four short blasts in succession.

Sailing-vessels and boats of less than 20 tons gross tonnage shall not be obliged to give the above-mentioned signals, but if they do not, they shall make some other efficient sound-signal at intervals of not more than 1 minute.

Speed of Ships to be moderate in Fog, &c.

Art. 16. Every vessel shall, in a fog, mist, falling snow, or heavy rain-storms, go at a moderate speed, having careful regard to the existing circumstances and conditions.

A steam-vessel hearing, apparently forward of her beam, the fog-signal of a vessel the position of which is not ascertained, shall, so far as the circumstances of the case admit, stop her engines, and then navigate with caution until danger of collision is over.

Steering and Sailing Rules.

Preliminary.—Risk of Collision.

Risk of collision can, when circumstances permit, be ascertained by carefully watching the compass bearing of an approaching vessel. If the bearing does not appreciably change, such risk should be deemed to exist.

Art. 17. When two sailing-vessels are approaching one another, so as to involve risk of collision, one of them shall keep out of the way of the other, as follows, viz.:—

(*a.*) A vessel which is running free shall keep out of the way of a vessel which is close-hauled.

(*b.*) A vessel which is close-hauled on the port tack shall keep out of the way of a vessel which is close-hauled on the starboard tack.

(*c.*) When both are running free, with the wind on different sides, the vessel which has the wind on the port side shall keep out of the way of the other.

(*d.*) When both are running free, with the wind on the same side, the vessel which is to windward shall keep out of the way of the vessel which is to leeward.

(*e.*) A vessel which has the wind aft shall keep out of the way of the other vessel.

Art. 18. When two steam-vessels are meeting end on, or nearly end on, so as to involve risk of collision, each shall alter her course to starboard, so that each may pass on the port side of the other.

This Article only applies to cases where vessels are meeting end on, or nearly end on, in such a manner as to involve risk of collision, and does not apply to two vessels which must, if both keep on their respective courses, pass clear of each other.

The only cases to which it does apply are when each of the two vessels is end on, or nearly end on, to the other; in other words, to cases in which, by day, each vessel sees the masts of the other in a line, or nearly in a line, with her own; and by night, to cases in which each vessel is in such a position as to see both the side-lights of the other.

It does not apply, by day, to cases in which a vessel sees another ahead crossing her own course: or by night, to cases where the red light of one vessel is opposed to the red light of the other, or where the green light of one vessel is opposed to the green light of the other, or where a red light without a green light, or a green light without a red light, is seen ahead, or where both green and red lights are seen anywhere but ahead.

Art. 19. When two steam-vessels are crossing, so as to involve risk of collision, the vessel which has the other on her own starboard side shall keep out of the way of the other.

Art. 20. When a steam-vessel and a sailing-vessel are proceeding in such directions as to involve risk of collision, the steam-vessel shall keep out of the way of the sailing-vessel.

Art. 21. Where by any of these Rules one of two vessels is to keep out of the way, the other shall keep her course and speed.

Art. 22. Every vessel which is directed by these Rules to keep out of the way of another vessel shall, if the circumstances of the cases admit, avoid crossing ahead of the other.

Art. 23. Every steam-vessel which is directed by these Rules to keep out of the way of another vessel shall, on approaching her, if necessary, slacken her speed, or stop or reverse.

Art. 24. Notwithstanding anything contained in these Rules, every vessel overtaking any other shall keep out of the way of the overtaken vessel.

Every vessel coming up with another vessel from any direction more than 2 points abaft her beam, *i.e.*, in such a position, with reference to the vessel which she is overtaking that at night she would be unable to see either of that vessel's side-lights, shall be deemed to be an overtaking vessel; and no subsequent alteration of the bearing between the two vessels shall make the overtaking vessel a crossing vessel within the meaning of these Rules, or relieve her of the duty of keeping clear of the overtaken vessel until she is finally past and clear.

As by day the overtaking vessel cannot always know with certainty whether she is forward of or abaft this direction from the other vessel, she should, if in doubt, assume that she is an overtaking vessel and keep out of the way.

Art. 25. In narrow channels every steam-vessel shall, when it is safe and practicable, keep to that side of the fairway, or mid-channel, which lies on the starboard side of such vessel.

Art. 26. Sailing-vessels under way shall keep out of the way of sailing-vessels or boats fishing with nets, or lines, or trawls. This Rule shall not give to any vessel or boat engaged in fishing the right of obstructing a fairway used by vessels other than fishing-vessels or boats.

Art. 27. In obeying and construing these Rules due regard shall be had to all dangers of navigation and collision, and to any special circumstances which may render a departure from the above Rules necessary in order to avoid immediate danger.

Sound-Signals for Vessels in Sight of one another.

Art. 28. The words "short blast" used in this Article shall mean a blast of about one second's duration.

When vessels are in sight of one another, a steam-vessel under way, in taking any course authorized or required by these Rules, shall indicate that course by the following signals on her whistle or siren, viz.:—

One short blast to mean, "I am directing my course to starboard."

Two short blasts to mean, "I am directing my course to port."

Three short blasts to mean, "My engines are going full speed astern."

No Vessel, under any circumstances, to neglect proper Precautions.

Art. 29. Nothing in these Rules shall exonerate any vessel, or the owner, or master, or crew thereof, from the consequences of any neglect to carry lights or signals, or of any neglect to keep a proper look-out, or of the neglect of any precaution which may be required by the ordinary practice of seamen, or by the special circumstances of the case.

Reservation of Rules for Harbours and Inland Navigation.

Art. 30. Nothing in these Rules shall interfere with the operation of a special Rule, duly made by local authority, relative to the navigation of any harbour, river, or inland waters.

Distress Signals.

Art. 31. When a vessel is in distress and requires assistance from other vessels or from the shore, the following shall be the signals to be used or displayed by her, either together or separately, viz.:—

In the daytime—

1. A gun fired at intervals of about a minute.
2. The International Code signal of distress, indicated by N C.
3. The distant signal, consisting of a square flag, having either above or below it a ball, or anything resembling a ball.
4. Rockets or shells, as prescribed below for use at night.
5. A continuous sounding with any fog-signal apparatus.

At night—

1. A gun fired at intervals of about a minute.
2. Flames on the vessel (as from a burning tar-barrel, oil-barrel, &c.).
3. Rockets or shells, bursting in the air with a loud report, and throwing stars of any colour or description, fired one at a time at short intervals.
4. A continuous sounding with any fog-signal apparatus.

Appendix (B).

THE following Resolutions have been approved of by the Conference, and are recommended to the attention of the Powers represented thereat:—

1. The power of all lights should be expressed by referring them all to one standard, by which the light issuing from the lantern should be measured.

2. The minimum power only of each light should be definitely fixed, leaving it to the judgment of the parties responsible for fitting out the vessels with proper lanterns to employ lamps of this or greater power.

3. The use of incandescent lamps should be permitted; the use of arc lights at present should be excluded for all purposes other than signalling and searching.

4. Each lantern should be so constructed that the minimum power of light can be found at every point where the light is to be visible after the lamp has been fitted with proper screens.

5. The lanterns should be so constructed as to insure the light having at least the required minimum power in the ideal line connecting the lantern with the horizon, even though the vessel be heeled one way or the other 10 degrees.

6. The colour of the glasses by which the colouring of the light is to be produced should be so chosen that, if possible, the red light shall have no admixture of green, nor the green light of red, rays, and that both colours can be readily and unmistakably distinguished.

7. No detailed description should be internationally adopted for the construction of the lamp or lantern, so that a fair chance may be given to inventors to produce serviceable articles.

8. The side-lights should be so screened as to prevent the most convergent rays of the lights being seen across the bows more than half-a-point.

9. The side-lights should be placed in steam-vessels not forward of the masthead-light.

10. To meet the number of complaints as to the absence of proper lights on sailing-vessels, the attention of the Powers is called to the better enforcement of the Regulations in that behalf.

11. All steam-whistles, sirens, fog-horns, and bells should be thoroughly tested as to their efficiency, and should be capable of being heard at a stated minimum distance, and should be so regulated that the tones of whistles and sirens should be as distinct as possible from the sound of fog-horns.

12. Steam-vessels should be provided, if possible, with means of blowing off surplus steam when the engines are stopped, in such a manner as to occasion as little noise as possible.

13. In clear weather at sea no vessel should attempt to cross the bows of the leaders of any squadron of three or more ships of war in regular formation, nor unnecessarily to pass through the lines of such squadron.

14. In every case of collision between two vessels it should be the duty of the master or person in charge of each vessel, if and so far as he can do so without serious danger to his own vessel, crew, and passengers (if any), to stay by the other vessel until he has ascertained that she has no need of further assistance, and to render to the other vessel, her master, crew, and passengers (if any), such assistance as may be practicable, and as may be necessary, in order to save them from any danger caused by the collision, and also to give to the master or person in charge of the other vessel the name of his own vessel, and her port of registry, or the port or place to which she belongs, and also the name of the ports and places from which, and to which, she is bound.

Inclosure 10 in No. 143.

Report of the Committee on Life-Saving Systems and Devices.

Sir, *Washington, December 5,* 1889.

THE Committee on Life-Saving Systems and Devices, appointed under a Resolution of the Marine Conference, was at first in doubt whether the terms of the Resolution gave it authority to consider and report upon all the topics embraced in Division V of the programme; but the subsequent action of the Conference in appointing Committees to report upon all the subjects of the other Divisions, yet making no further provision for those of Division V, seemed clearly to imply that it was intended that this Committee should deal with them. It has accordingly done so, and herewith submits its Report. The various subjects will be taken up in their order upon the programme.

1. Saving of life and property from shipwreck at sea.

"(*a*). Duties of vessels after collision."

What these duties are is obvious enough. Common humanity requires that the colliding vessels should remain by each other and render all needed assistance so long as they can do so consistently with their own safety. Experience shows, however, that masters of vessels frequently take advantage of the circumstances attending such disasters to escape from the scene without identification, in order to avoid responsibility. Several of the maritime nations have, therefore, imposed upon them the legal obligation of performing these natural duties. The extent to which they are evaded where such legal requirement does not exist is probably not generally appreciated. The Committee has had before it statistics of one such country, which show that in 8 per cent. of the collisions reported the master of one of the vessels leaves the other to take care of herself and her people, and gets away without being known. In these instances there was loss of life upon some of the vessels so abandoned, some of them went down, and all suffered damage. It would seem, then, that any effective measure which might prevent such a practice, or make it less frequent, would not only be in the interest of humanity, but also aid in securing justice in regard to the rights of property. The Committee, therefore, is of the opinion that, in case of collision between two vessels, the master or person in charge of each vessel should be required, so far as he can without danger to his own vessel, crew, or passengers, to stay by the other vessel until he has ascertained that she has no need of further assistance, and to render to the other vessel, her master, crew, and passengers, such assistance as may be practicable and necessary in order to save them from any danger caused by the collision; and also to give to the master or person in charge of the other vessel the name of his own vessel, and of her port of registry, or of the port or place to which she belongs, and the names of the ports or the places from which and to which she is bound.

So far as the Committee can learn, the laws of those countries which have taken action upon the subject are to the above effect, substantially agreeing in defining the duties of masters, although the infraction of the law is differently dealt with in the different countries.

In expressing the foregoing opinion the Committee is unanimous, but a minority thinks the Conference should indicate what, in its opinion, the penalty of failure to comply with the duties prescribed should be. The majority, however, do not deem this necessary, believing that the consequences of disobedience to their laws can and will be properly taken care of by the several Governments, without suggestion from the Conference.

For the information of the Conference, the enactments of Great Britain upon the subject, which prescribe severer penalties for disregard of the duties imposed than those of any other nation, are appended to this Report. (See Appendix A.)

"(*b*). Apparatus for life-saving to be carried on board ship. (Life-boats, life-preservers, life-rafts, pumps, and fire-extinguishing apparatus.)"

The Government of Chile has made the most liberal provision that the Committee has knowledge of for the safety of life on shipboard, requiring her vessels to be furnished with boats sufficient in number and capacity to afford the greatest security possible to everybody on board in case of disaster. (See Appendix B.) The Committee, however, does not regard the universal application of this provision as practicable under existing conditions; it believes that the basis upon which an agreement between the several nations is most likely to be established is to be found in the "Rules of the Board of Trade" of Great Britain, under the "Merchant Shipping (Life-Saving Appliances) Act of 1888," which are to go into effect on the 31st March, 1890. These Rules provide for almost all cases that may arise under the vicissitudes of navigation, while they are sufficiently elastic to admit of adjustment to the various conditions existing in the countries interested, without violating their spirit. (See Appendix C.)

The Committee also recommends the extension of the principle of these Rules to all smaller craft as far as practicable, and that each vessel of this class should carry at least one life-buoy of approved pattern and material, and for every person on board an efficient life-belt or jacket.

The means of extinguishing fire on vessels has become to a considerable extent a matter relating to their construction, and the observation of members of the Committee is that in most vessels recently built great care is taken to make due provision in this respect, it being for the interest of the owners to do so. Most of the maritime nations have also enacted laws which provide for a suitable equipment of pumps and other devices. Perhaps, therefore, there is now no great necessity for action upon the subject by the Conference. However this may be, it would be impracticable for the Committee to prescribe any definite system, as it would involve a careful classification of vessels and a thorough study of a variety of apparatus, the necessary information and data for which it would be impossible to procure, properly consider, and report upon in season to be of avail to the Conference.

"(*c*). The use of oil, and the necessary apparatus for its use."

There has been placed before the Committee much matter relating to this subject, consisting chiefly of reports from vessels that have used oil for calming dangerous seas, accounts of trials and experiments made under various conditions, deductions drawn from such reports and experiments, and directions for the application of oil under various conditions and circumstances.

An examination of this material, and the information the Committee already possessed, have led to the conclusion that there need be no longer any doubt that the proper application of oil is efficacious on the open sea, but that there are conditions under which the action of breaking waves is not thereby much, if at all, modified. Its effect on the surf over bars at the mouths of rivers and those lying off beaches is especially doubtful. A Circular letter relative to the "Use of Oil at Sea," issued by the Board of Trade of Great Britain, says: "In a surf, or waves breaking on a bar, where a mass of liquid is in actual motion in shallow water, the effect of the oil is uncertain, as nothing can prevent the larger waves from breaking under such circumstances; but even here it is of some service." Other official documents declare that in an exhaustive series of experiments no effect whatever was produced upon the surf breaking over the outlying bars of beaches.

The Committee is of opinion that all sea-going vessels should be supplied with a proper quantity of animal or vegetable oil (which seems to be more effective than mineral), and with suitable appliances for its distribution. For ordinary voyages the quantity need not be large. The best means of distributing it that have been brought to the attention of

the Committee appear to be those specified by Vice-Admiral Cloué, published in a Circular issued by the French Government. (See Appendix D.)

"(*d*). Uniform inspections as to (*b*) and (*c*)."

If the maritime nations should agree upon uniform requirements in respect to life-saving apparatus to be carried on board ship, and as to the use of oil and the necessary apparatus for its use, uniform inspections might perhaps be advantageous, but it would be impossible to formulate an adequate system for this purpose without knowing definitely what those requirements might be; and even then it would be doubtful, considering the great diversity of administrative methods and machinery in different countries, whether any practicable system could be devised that would be acceptable to all.

2. Saving of life and property from shipwreck by operations from shore.

The Committee has had before it a number of valuable papers describing the organization and methods of institutions for the saving of life from shipwreck, and indicating the extent and results of their work. These will be found in Appendices (E) and (F). An examination of them clearly shows that these institutions are all managed by men whose hearts are in their work, and who may be trusted to use every means known to them for perfecting the apparatus and methods employed for the rescue of unfortunates cast upon their shores. The organization of the service in each country must necessarily vary according to the condition and temper of the people, and the character and habits of the coast population from which the men constituting the effective life-saving force must be drawn. It is, therefore, deemed impracticable to formulate any definite rules which would be applicable to all alike. It appears desirable, however, that the officers of very organization should study the features of the others, in order that they may adopt such improvements as seem suitable for their own. Some of the establishments appear to have been brought to a high degree of excellence.

It seems desirable that careful attention should be given to the frequent drilling and exercising of life-saving crews. It is also deemed important that a watch or patrol should, wherever practicable, be established upon dangerous coasts at night, and during thick weather by day, not only for the early discovery of wrecks, but in order to warn off vessels that may be incautiously standing into danger. Coastguards are established in various countries for the prevention of smuggling, and where this is the case they can be utilized to give timely notice and assistance to life-saving crews, or even to constitute such crews, as is already done in some countries.

With regard to special varieties of life-boats and other appliances, the Committee believes that the matter can be safely trusted to the judgment and discretion of the officers in charge of the life-saving institutions of the several countries. The requirements vary so greatly upon different coasts that boats and appliances effective in one place are often ill-adapted or useless in another. Besides, the preferences of the men employed have to be considered, they usually having greater confidence in particular models because they are accustomed to them. Confidence in the appliances a crew is required to use is, in general, an admitted essential to success. No one can judge of these matters so well as the officers whose duty it is to study the local conditions, and who are thoroughly acquainted with the prejudices and habitudes of the men.

It is desirable that officers of life-saving institutions should generally communicate freely with each other with reference to any improvements that may occur to them, either in apparatus, methods, or organization, with a view both to the diffusion of information concerning such matters, and to establishing an international comity with regard to a beneficent work.

With reference to sub-section (*d*), "Uniform means of transmitting information between stranded vessels and the shore," the Committee would say that co-operation between mariners upon a wrecked vessel and those who wish to assist them upon shore is of the highest importance. The most earnest attempts at aid may be rendered nugatory if the shipwrecked are not aware of what is required of them. In order to secure this co-operation various means have been devised in maritime countries, such as attaching tally-boards to the lines of the beach-apparatus, the publication of instructions in the official log-books distributed to vessels, the issuing of pamphlets or cards of such instructions, or the very excellent method of posting, in the forecastle, or some convenient place in a vessel, a durable placard showing by illustrations the manner in which life-saving lines are to be secured on board, and giving necessary instructions relative thereto.

All these measures are good, but the instructions have not been as generally distributed among vessels of all nationalities as they should be, and with a view to the universal diffusion of this information it is recommended that a uniform system of issuing and distributing such instructions be adopted by the several maritime nations.

The Committee is also of the opinion that the instructions generally issued do not adequately provide for co-operation between the ship and the shore, and that they should be supplemented by a few simple signals for the purpose of direct communication. The International Code can often be used in the daytime, but a still simpler system should be provided for the few signals required. It is believed that the signals absolutely necessary can be reduced to very few, and that the adoption and publication of such a system would be of great benefit in the emergencies of shipwreck.

If it be determined to establish an International Code of night-signals, such as is referred to in General Division VIII of the programme—("Night-Signals for communicating Information at Sea")—the signals needed for communicating at night between wrecked vessels and the shore ought to be incorporated therein. If it should prove impracticable to adopt a system of night-signals for the International Code, it may yet be worth considering whether the few signals needed for use at wrecks ought not to be adopted. Such a system is recommended by the Committee, and will be found described in detail in the fourth Resolution at the close of this Report. Every signal there mentioned has been found necessary in emergencies that have actually arisen in service.

3. Official inquiries into causes and circumstances of shipwrecks and other casualties.

For countries which have not already provided, by legislative enactments, for official inquiries into the causes and circumstances of shipwrecks or other accidents to vessels that are of serious importance, the adoption of such laws is recommended, as it is believed that they are the most effective means by which masters and officers of vessels can be impressed with a proper sense of the serious responsibility that rests upon them, and that they therefore constitute one of the most important safeguards for life and property afloat that it is possible to devise. They would also add to the efficiency of laws designed to prevent the sending out of unseaworthy and overloaded vessels where such laws exist, and where they do not, would to a certain extent operate in their stead. They would, moreover, give information which might be of great value in showing the general causes and distribution of wrecks, and indirectly indicate the methods by which casualties might be averted or lessened.

The Committee has formulated the foregoing recommendations into the following propositions, which are submitted for the consideration of the Conference:—

1. * In every case of collision between two vessels, it shall be the duty of the master or person in charge of each vessel, if and so far as he can do so without danger to his own vessel, crew, and passengers (if any), to stay by the other vessel until he has ascertained that she has no need of further assistance, and to render to the other vessel, her master, crew, and passengers (if any), such assistance as may be practicable, and as may be necessary in order to save them from any danger caused by the collision; and also to give to the master or person in charge of the other vessel the name of his own vessel, and of her port of registry, or of the port or place to which she belongs, and also the names of the ports and places from which and to which she is bound.

2. *Resolved*,—That the Conference approves of the principle of the "Rules made by the Board of Trade of Great Britain under the Merchant Shipping (Life-Saving Appliances) Act, 1888," relating to boats and appliances to be carried on board ship for saving life; and recommends that the several Governments adopt measures to secure compliance with this principle in regard to such boats and appliances for vessels of 150 tons and upwards gross tonnage.

It is also recommended that the principle of these Rules be extended to all smaller craft as far as practicable; and that each vessel of this class should carry at least one life-buoy of approved pattern and material, and for every person on board an efficient life-belt or jacket.

3. *Resolved*,—That the Conference recommends that the several Governments require all their sea-going vessels to carry a sufficient quantity of animal or vegetable oil, for the purpose of calming the sea in rough weather, together with suitable means for applying it.

4. *Resolved*,—That the Conference recommends that all institutions for saving life from wrecked vessels prepare uniform instructions to mariners with reference to their co-operation with those attempting their rescue from the shore, and that said instructions include the following signals:—

Upon the discovery of a wreck by night the life-saving force will burn a red pyrotechnic light or a red rocket to signify—"You are seen; assstance will be given as soon as possible."

* *Note.*—This proposition is stated in the form and language of the "New Section" proposed November 26, 1889, to be added to the "Rules of the Road;" the consideration of which the Conference has voted to postpone, pending the presentation of this Repor

A red flag waved on shore by day, or a red light, red rocket, or red Roman candle displayed by night, will signify—"Haul away."

A white flag waved on shore by day, or a white light slowly swung back and forth, or a white rocket or white Roman candle fired by night will signify—"Slack away."

Two flags, a white and a red, waved at the same time on shore by day, or two lights, a white and a red, slowly swung at the same time, or a blue pyrotechnic light burned by night, will signify—"Do not attempt to land in your own boats. It is impossible."

A man on shore beckoning, by day, or two torches burning near together, by night, will signify—"This is the best place to land."

Any of these signals may be answered from the vessel as follows: In the day-time—by waving a flag, a handkerchief, a hat, or even the hand; at night—by firing a rocket, a blue light or a gun, or by showing a light over the ship's gunwale for a short time and then concealing it.

And it is recommended that the several Governments take measures to keep all their sea-going vessels supplied with copies of such instructions.

5. *Resolved*,—That the Conference recommends that the several nations provide by legislative enactments for official inquiry into the causes and circumstances of all shipwrecks and other serious casualties happening to their vessels.

The Committee has examined a large number of devices and projects relating to the saving of life from shipwreck, a list of which will be found below. Many of them indicate considerable ingenuity, and their number and variety show the great amount of interest and attention that this subject is receiving. The Committee has consulted them freely in reaching conclusions relative to the topics placed before it, but has not deemed it advisable to make specific recommendations regarding any particular device or plan, believing that such action is not expected of it by the Conference. Furthermore, to reach conclusions with regard to many of them would involve experiments or trials beyond the power of the Committee. To recommend those whose merits were already known to the Committee or which required no such tests might be unfair to the others.

Duties of Masters in Case of Collision.

SECTION 16. In every case of collision between two vessels it shall be the duty of the master or person in charge of each vessel, if and so far as he can do so without danger to his own vessel, crew, and passengers (if any), to stay by the other vessel until he has ascertained that she has no need of further assistance, and to render to the other vessel, her master, crew, and passengers (if any), such assistance as may be practicable, and as may be necessary in order to save them from any danger caused by the collision, and also to give to the master or person in charge of the other vessel the name of his own vessel, and of her port of registry, or of the port or place to which she belongs, and also the names of the ports and places from which and to which she is bound.

If he fails so to do, and no reasonable cause for such failure is shown, the collision shall, in the absence of proof to the contrary, be deemed to have been caused by his wrongful act, neglect, or default.

Every master or person in charge of a British vessel who fails, without reasonable cause, to render such assistance or give such information as aforesaid, shall be deemed guilty of a misdemeanour, and if he is a certificated officer, an inquiry into his conduct may be held, and his certificate may be cancelled or suspended.

(Translation.)

Chapter III.—*Small Boats.*

ARTICLE 13. The vessels to which Article 1 refers shall keep empty, in good state for service, and ready to be launched at sea at any moment, the number of small boats in proportion to the crew specified below:—

Crew of from 2 to 5 men, including the captain, 1 boat, with capacity for 10 men.
Crew of from 6 to 10 men, including the captain, 2 boats, with capacity for 20 men.
Crew of from 11 to 20 men, including the captain, 3 boats with capacity for 40 men.
Crew of from 21 to 30 men, including the captain, 4 boats, with capacity for 50 men.
Crew of from 31 to 50 men, including the captain, 4 boats, with capacity for 70 men.
Crew of from 51 to 70 men, including the captain, 5 boats, with capacity for 100 men.
Crew of from 71 to 100 men, including the captain, 6 boats, with capacity for 150 men.

For each gang of 30 men exceeding 100 a larger boat shall be required, with a capacity for 50 men.

In order to determine the capacity of a boat, its tonnage shall be considered, the capacity for one individual being reckoned equal to each fraction of ·15 of a ton contained, if it is a double-benched boat, and ·25 if it is single.

Article 14. The dimensions of each one of the boats may vary according to the discretion of the ship-owner, providing always that none of the boats equipped shall be of less than $1\frac{1}{2}$ tons burden, and that the total shall reach the tonnage required by Regulation according to the number of individuals of its equipment.

Nevertheless, those vessels that carry a crew of more than forty men shall replace at least one of its boats by a life-saving boat which can conveniently accommodate thirty men.

Article 15. All the boats of the equipment shall be fitted out completely and in good condition, the captains seeing that the oars, masts, and yards are found fastened to the thwarts, and the sails and tools properly arranged in sacks or cases, in order that in an emergency they may be adjusted without difficulty in the several boats to which they belong.

Equal care shall be taken that they are kept clean, painted, and covered, and that they are washed sufficiently to prevent their becoming dry.

The loss, damage, or destruction of the small boats must be repaired at the first available port.

Appendix (C).

Report of Committee on Life-Saving Systems and Devices.

Report made to the Board of Trade by the Committee appointed by that Board, in pursuance of "The Merchant Shipping (Life-Saving Appliances) Act, 1888" (51 & 52 Vict., cap. 24).

[Presented to both Houses of Parliament by Command of Her Majesty.]

Life-Saving Appliances Committee, 7, Whitehall Gardens, London, April 11, 1889.

Sir,

IN compliance with the request contained in your Minute of the 12th November, 1888, we have the honour to report that we have carefully considered the matters referred to in the second schedule of "The Merchant Shipping (Life-Saving Appliances) Act, 1888," viz.:—

"1. The arranging of British ships into classes, having regard to the services in which they are employed, to the nature and direction of the voyage, and to the number of persons carried.

"2. The number and description of the boats, life-boats, life-rafts, life-jackets, and life-buoys to be carried by British ships, according to the class in which they are arranged and the mode of their construction; also the equipments to be carried by the boats and rafts, and the methods to be provided to get the boats and other life-saving appliances into the water; such methods may include oil for use in stormy weather.

"3. The quantity, quality, and description of buoyant apparatus to be carried on board ships carrying passengers, either in addition to or in substitution for boats, life-boats, life-rafts, life-jackets, and life-buoys."

We now submit herewith Rules which we have prepared, and which we advise should be made under the Act. These Rules, if adopted, will, we think, insure that ships of different classes shall be provided with such appliances for saving life at sea as (having regard to the nature of the services in which they are employed, and the avoidance of undue incumbrance of the ships' decks) are best adapted for securing the safety of their crews and passengers.

As we are, fortunately, unanimous in our recommendation of the Rules submitted, we do not think it necessary to trouble you with any account of the reasons that have led to our conclusions further than to state that we have, throughout, proceeded on the assumption that we had simply to arrange British ships into classes, having regard, among other matters, to the larger or smaller number of persons they are likely to carry, and to advise what life-saving appliances can properly be provided for the ships of each class.

We have, &c.

(Signed) THOS. H. ISMAY, *Chairman.*

JAS. B. BUTCHER.

(Signed) Walter J. Howell, *Secretary.*

P.S.—We have shown some appreciation of the importance of efficient subdivision of ships in Class 1, Division (A), paragraph (*g*), of these Rules, but we consider it our duty to further express our sense of the importance of the question, and to recommend that it should be investigated by a Committee of duly qualified persons, the subject, as a whole, having been held to be outside the scope of the reference to this Committee.

To the Right Hon. Sir Michael E. Hicks Beach, Bart., M.P.,
President of the Board of Trade.

Note.—Mr. T. S. Lemon is now absent abroad.

Rules made by the Board of Trade under "The Merchant Shipping (Life-Saving Appliances) Act, 1888" (51 & 52 Vict., cap. 24), to come into force on the 31st March, 1890.

At the Council Chamber, Whitehall, this 28th day of June, 1889.

Present:

THE RIGHT HONOURABLE SIR MICHAEL E. HICKS BEACH, BART., M.P.

In pursuance of the provisions of "The Merchant Shipping (Life-Saving Appliances) Act, 1888," the Board of Trade do hereby make the annexed Rules relating to life-saving appliances. These Rules shall come into effect on the 31st March, 1890.

(Signed) M. E. HICKS BEACH.

"MERCHANT SHIPPING (LIFE-SAVING APPLIANCES) ACT, 1888."

For the purposes of these Rules, British ships shall be arranged into the following classes:—

Page

CLASS 1.—Division (A) 214
Steam-ships carrying emigrant passengers subject to all the provisions of the "Passengers Acts."

CLASS 1.—Division (B) 214
Sailing-ships carrying emigrant passengers subject to all the provisions of the "Passengers Acts."

CLASS 2.—Division (A) 215
Foreign-going steam-ships having passenger certificates under the "Merchant Shipping Acts."

CLASS 2.—Division (B) 215
Foreign-going sailing-ships carrying passengers, but *not* subject to all the provisions of the "Passengers Acts."

CLASS 3.—Division (A) 215
Foreign-going steam-ships *not* certified to carry passengers.

CLASS 3.—Division (B) 215
Foreign-going sailing-ships *not* carrying passengers.

CLASS 4.—Division (A) 215
Steam-ships having passenger certificates under the "Merchant Shipping Acts" authorizing them to carry passengers anywhere within the home trade limits, that is to say, between places in the United Kingdom, or between the United Kingdom and ports in Europe between the River Elbe and Brest.

CLASS 4.—Division (B) 216
Steam-ships in the same trades *not* certified to carry passengers.

CLASS 4.—Division (C) 216
Sailing-ships in the same trades *not* carrying passengers.

CLASS 5... 216
Steam-ships having passenger certificates authorizing them to carry passengers within certain specified limits of the home trade; that is to say, on short specified passages along the coasts of the United Kingdom, or between Great Britain and Ireland, or between Great Britain or Ireland and the Isle of Man.

CLASS 6... 216
Steam-ships carrying passengers on short excursions or pleasure trips, to sea, or in estuaries or mouths of rivers during daylight, or across the Straits of Dover.

CLASS 7... 217
Steam-ships carrying passengers on rivers (and) (or) lakes, but not going to sea or into rough waters.

GENERAL RULES 217

Class 1.—Division (A).

Rules and Table for Steam-ships carrying Emigrant Passengers, subject to all the Provisions of the "Passengers Acts."

(*a.*) Ships of this Division shall carry boats placed under davits, having proper appliances for getting them into the water, in number and capacity not less than are given in the following Table; the boats to be equipped and of the description defined in the General Rules appended hereto.

(*b.*) Provided that no ship of this Division shall be required to carry more boats so placed than will furnish sufficient accommodation for all persons on board.

(*c.*) Masters or owners of ships of this Division claiming to carry fewer boats than are given in the following Table must declare before the Collector or other officer of Customs, at the time of clearance, that the boats actually placed under davits are sufficient to accommodate all persons on board, allowing 10 cubic feet of boat capacity per Rule 2, p. 9,* for each adult person, or "statute adult."

(*d.*) Table for Class 1 (Division A):—

Gross Tonnage.	Minimum Number of Boats to be placed under Davits.	Total Minimum Cubic Contents of Boats to be placed under Davits. L. × B. × D. × ·6.	Gross Tonnage.	Minimum Number of Boats to be placed under Davits.	Total Minimum Cubic Contents of Boats to be placed under Davits. L. × B. × D. × ·6.
1.	2.	3.	1.	2.	3.
9,000 and upwards.	14	5,250	4,000 and under 4,250	8	2,800
8,500 and under 9,000	14	5,100	3,750 „ 4,000	8	2,700
8,000 „ 8,500	14	5,000	3,500 „ 3,750	8	2,600
7,750 „ 8,000	12	4,700	3,250 „ 3,500	8	2,500
7,500 „ 7,750	12	4,600	3,000 „ 3,250	8	2,400
7,250 „ 7,500	12	4,500	2,750 „ 3,000	6	2,100
7,000 „ 7,250	12	4,400	2,500 „ 2,750	6	2,050
6,750 „ 7,000	12	4,300	2,250 „ 2,500	6	2,000
6,500 „ 6,750	12	4,200	2,000 „ 2,250	6	1,900
6,250 „ 6,500	12	4,100	1,750 „ 2,000	6	1,800
6,000 „ 6,250	12	4,000	1,500 „ 1,750	6	1,700
5,750 „ 6,000	10	3,700	1,250 „ 1,500	6	1,500
5,500 „ 5,750	10	3,600	1,000 „ 1,250	4	1,200
5,250 „ 5,500	10	3,500	750 „ 1,000	4	1,000
5,000 „ 5,250	10	3,400	500 „ 750	4	800
4,750 „ 5,000	10	3,300	250 „ 500	2	400
4,500 „ 4,750	8	2,900	150 „ 250	2	300
4,250 „ 4,500	8	2,900			

Note.—Where in vessels already fitted the required cubic contents of boats placed under davits is provided, although by a smaller number of boats than the minimum required by this Table, such boats shall be regarded as complying with these Rules.

(*e.*) Not less than half the number of boats placed under davits shall be boats of section (A), p. 9,* or section (B), p. 9.* The remaining boats may also be of such description, or may, in the option of the ship-owner, conform to section (C), p. 9,* or section (D), p. 9,* provided that not more than two boats shall be of section (D).

(*f.*) If the boats placed under davits in accordance with the foregoing Table (*d*) do not furnish sufficient accommodation for all persons on board, then additional wood, metal, collapsible, or other boats of approved description (whether placed under davits or otherwise) or approved life-rafts shall be carried.

Subject to the provision contained in paragraph (*b*) of these Rules, such additional boats or rafts shall be of at least such carrying capacity that they and the boats required to be placed under davits by Table (*d*) provide together in the aggregate double the minimum cubic contents required by column 3 of that Table.

All such additional boats or rafts shall be placed as conveniently for being available as the ship's arrangements admit of, having regard to the avoidance of undue encumbrance of the ship's deck, and to the safety of the ship for her voyage.

(*g.*) When ships are divided into efficient water-tight compartments, so that, with any two of them in free communication with the sea, the ship will remain afloat in moderate weather, they shall only be required to carry additional boats or life-rafts of one-half of the capacity required by paragraph (*f*) of these Rules.

(*h.*) In addition to the life-saving appliances before mentioned, ships of this Division shall carry not less than one approved life buoy (Rule 11 (*a*) or 11 (*b*), pp. 10, 11†) for every boat placed under davits. They shall also carry approved life-belts (Rule 10, p. 10†) or other similar approved articles of equal buoyancy suitable for being worn on the person, so that there may be at least one for each person on board the ship.

Class 1.—Division (B).

Rules for Sailing-ships carrying Emigrant Passengers, subject to all the Provisions of the "Passengers Acts."

(*a.*) Ships of this Division shall carry boats in accordance with the Table (*d*) provided for Division (A) of this Class, and such boats shall be, as far as practicable, placed under davits, with

* See p. 217. † See p. 218.

proper appliances for getting them into the water, to the satisfaction of the Board of Trade officer; such of these boats as are not placed under davits being so carried that they can also be readily got into the water to the satisfaction of the Board of Trade officer.

(*b.*) If the boats so carried do not furnish sufficient accommodation for all persons on board, then additional life-saving appliances shall be supplied as for ships in Division (A) of this Class.

(*c.*) Provided that no ship in this Division shall be required to carry more boats than will furnish accommodation for all persons on board.

(*d.*) Approved life-belts (Rule 10, p. 10*) or other similar approved articles shall be carried as required for ships of Class 1, Division (A), and also one life-buoy (Rule 11 (*a*) or 11 (*b*), pp. 10, 11*) for each boat of wood or metal.

Class 2.—Division (A).

Rules for Foreign-going Steam-ships having Passenger Certificates under the "Merchant Shipping Acts."

Ships of this Division shall be subject to the same requirements as those in Class 1, Division (A).

Class 2.—Division (B).

Rules for Foreign-going Sailing-ships carrying Passengers, but not subject to all the Provisions of the "Passengers Acts."

Ships of this Division shall be subject to the same requirements as those in Class 1, Division (B).

Class 3.—Division (A).

Rules for Foreign-going Steam-ships not certified to carry Passengers.

(*a.*) Ships of this Division shall carry, on each side, at least so many and such boats of wood or metal placed under davits (of which one on each side shall be a boat of section (A), p. 9,† or of section (B), p. 9†), that the boats on each side of the ship shall be sufficient to accommodate all persons on board. They shall have proper appliances for getting the boats into the water.

(*b.*) They shall carry approved life-belts, as required for ships of Class 1, Division (A).

(*c.*) They shall carry not less than six approved life-buoys (Rule 11 (*a*) or 11 (*b*), pp. 10, 11*).

Class 3.—Division (B).

Rules for Foreign-going Sailing-ships not carrying Passengers.

(*a.*) Ships of this Division shall carry boats in accordance with the Table provided for Class 1, Division (B), and in addition thereto one good serviceable boat of section (D), p. 9.† Such boats shall be, as far as practicable, placed under davits, with proper appliances for getting them into the water, to the satisfaction of the Board of Trade officer.; such boats as are not placed under davits being so carried that they also can readily be got into the water to the satisfaction of the Board of Trade officer.

(*b.*) They shall carry approved life-belts, as required for ships in Class 1, Division (B), and also one life-buoy (Rule 11 (*a*) or 11 (*b*), pp. 10, 11*) for each boat of wood or metal.

Class 4.—Division (A).

Rules for Steam-ships having Passenger Certificates under the "Merchant Shipping Acts" authorizing them to carry Passengers anywhere within the Home Trade limits; that is to say, between places in the United Kingdom or between the United Kingdom and Ports in Europe between the River Elbe and Brest.

(*a.*) Ships of this Division shall carry boats placed under davits in accordance with the Rules and Table provided for ships in Class 1, Division (A).

(*b.*) If the boats placed under davits in accordance with this requirement do not furnish sufficient

* See p. 218. † See p. 217.

accommodation for all persons on board, then additional approved boats or approved life-rafts shall be supplied as for ships of Class 1, Division (A).

(*c.*) Provided that if (having regard to the avoidance of undue incumbrance of the ship's deck, and to the safety of the ship for her voyage) it is not practicable for a ship of this Division to carry additional approved boats or approved life-rafts as are required for ships of Class 1, Division (A), (*f*), the deficiency so caused may be made up by the supply of an equivalent number of approved buoyant deck seats or other approved buoyant deck fittings, to the satisfaction of the Board of Trade officer.

(*d.*) Ships of this Division shall carry not less than six approved life-buoys (Rule 11 (*a*) or 11 (*b*), pp. 10, 11*).

(*e.*) They shall also carry, in addition to the boats and appliances required above, approved life-belts (Rule 10, p. 10*) or other similar approved articles of equal buoyancy suitable for being worn on the person, so that there may be at least one for each person on board the ship.

Class 4.—Division (B).

Rules for Steam-ships in the same Trades not certified to carry Passengers.

(*a.*) Ships of this Division shall carry, on each side, at least so many and such boats of wood or metal placed under davits (of which one on each side shall be a boat of section (A), p. 9,† or of section (B), p. 9†), that the boats on each side of the ship shall be sufficient to accommodate all persons on board. They shall have proper appliances for getting the boats into the water.

(*b.*) They shall carry approved life-belts as for ships of Class 1, Division (A).

(*c.*) They shall carry not less than four approved life-buoys (Rule 11 (*a*) or 11 (*b*), pp. 10, 11*).

Class 4.—Division (C).

Rules for Sailing-ships in the same Trades not carrying Passengers.

(*a.*) Ships of this Division shall carry a boat or boats of wood or metal, at least sufficient for all persons on board, and in such a position as to be readily got into the water, to the satisfaction of the Board of Trade officer. Each boat shall be provided with 1 gallon of vegetable or animal oil in a vessel of an approved pattern for distributing it in the water in rough weather.

(*b.*) They shall carry an approved life-belt (Rule 10, p. 10*) for each person on board.

(*c.*) They shall carry at least two approved life-buoys (Rule 11 (*a*) or 11 (*b*), pp. 10, 11*).

Class 5.

Rules for Steam-ships having Passenger Certificates authorizing them to carry Passengers within certain specified limits of the Home Trade; that is to say, on short specified Passages along the Coasts of the United Kingdom, or between Great Britain and Ireland, or between Great Britain or Ireland and the Isle of Man.

(*a.*) Ships of this Division shall, according to their tonnage, carry boats placed under davits, as required by the Table for ships in Class 1, Division (A).

(*b.*) If the boats placed under davits in accordance with the above requirements do not furnish sufficient accommodation for all persons on board, then additional boats or approved life-rafts shall be supplied as for ships of Class 1, Division (A).

(*c.*) Provided that if (having regard to the avoidance of undue incumbrance of the ship's deck, and to the safety of the ship for her voyage) it is not practicable for a ship of this Division to carry additional approved boats or approved life-rafts as required for ships of Class 1, Division (A), the deficiency so caused may be made up by the supply of an equivalent number of approved buoyant deck seats or other approved buoyant deck fittings to the satisfaction of the Board of Trade officer.

(*d.*) Ships of this Division shall also carry approved life-belts (Rule 10, p. 11*) or other similar approved articles of equal buoyancy suitable for being worn on the person, so that there may be at least one for each person on board the ship.

(*e.*) At least one approved life-buoy (Rule 11 (*a*) or 11 (*b*), pp. 10, 11*) shall also be provided for each boat of wood or metal carried by the ship, but in no case shall less than six approved life-buoys be provided.

Class 6.

Rules for Steam-ships carrying Passengers on short Excursions or Pleasure Trips to Sea, or in Estuaries or Mouths of Rivers during daylight, or across the Straits of Dover.

(*a.*) Ships of this class shall carry at least two boats of section (A), p. 9,† or section (B), p. 9,† placed under davits, and with proper appliances for getting them into the water.

* See p. 218. † See p. 217.

(*b.*) They shall also carry other boats, approved buoyant apparatus (Rule 9, p. 10*) [and] [or] approved life-belts (Rule 10, p. 10*) sufficient (with the boats) to keep afloat all the persons on board the ship.

(*c.*) At least four approved life-buoys (Rule 11 (*a*) or 11 (*b*), pp. 10, 11*) shall be carried.

CLASS 7.

Rules for Steam-ships carrying Passengers on Rivers [and] [or] Lakes, but not going to Sea or into Rough Waters.

(*a.*) Ships of this class shall carry one boat in such a position that she can readily be got into the water. They shall also carry approved buoyant apparatus (Rule 9, p. 10*) or approved life-belts (Rule 10, p. 10*) and approved life-buoys (Rule 11, p. 10*) at least sufficient, together with the boat, to keep afloat all persons carried on board.

(*b.*) At least four approved life-buoys shall be carried.

Note.—A discretion to be exercised by the Board of Trade officer to relieve ferry-boats in narrow waters from the operation of Rule (*a*) of this class.

GENERAL RULES.

1. *Boats.*

Note.—All boats shall be properly equipped as provided by these Rules.

Section (A). A boat of this section shall be a life-boat properly constructed of wood or metal, having for every 10 cubic feet of her capacity, computed as in 2, at least 1½ cubic feet of strong and serviceable inclosed air-tight compartments, such that water cannot find its way into them.

Sec. (B). A boat of this section shall be a life-boat properly constructed of wood or metal, having inside and outside buoyancy apparatus together equal in efficiency to the buoyancy apparatus provided for a boat of section (A). At least one-half of the buoyancy apparatus must be attached to the outside of the boat.

Sec. (C). A boat of this section shall be a life-boat properly constructed of wood or metal, having some buoyancy apparatus attached to the inside [and] [or] outside of the boat equal in efficiency to one-half of the buoyancy apparatus provided for a boat of section (A) or section (B). At least one-half of the buoyancy apparatus must be attached to the outside of the boat.

Sec. (D). A boat of this section shall be a properly constructed boat of wood or metal.

Sec. (E). A boat of this section shall be a boat of approved form and material, which may be collapsible.

2. *Cubic Capacity.*—The cubic capacity of a boat shall be deemed to be her cubic capacity, ascertained (as in measuring ships for tonnage capacity) by Stirling's Rule; but as the application of that Rule entails much labour, the following simple plan, which is approximately accurate, may be adopted for general purposes, and when no question requiring absolutely correct adjustment is raised:—

Measure the length and breadth outside and the depth inside. Multiply them together and by ·6; the product is the capacity of the boat in cubic feet. Thus, a boat 28 feet long, 8 ft. 6 in. broad, and 3 ft. 6 in. deep, will be regarded as having a capacity of $28 \times 8{\cdot}5 \times 3{\cdot}5 \times {\cdot}6 = 499{\cdot}8$, or 500 cubic feet. If the oars are pulled in rowlocks, the bottom of the rowlock is to be considered the gunwale of the boat for ascertaining her depth.

3. *Number of Persons for Boats of Section* (A).—The number of persons a boat of section (A) shall be deemed fit to carry shall be the number of cubic feet ascertained as in 2, divided by 10. Thus, a boat whose cubic contents are 500 cubic feet, is deemed to be sufficient for fifty adult persons. The space in the boat shall be sufficient for the seating of the persons carried in it, and for the proper use of the oars.

4. *Number of Persons for other Boats.*—The number of persons a boat of section (B), (C), (D), or (E) shall be deemed fit to carry shall be the number of cubic feet ascertained as in 2, divided by 8.

5. *Appliances for lowering Boats.*—Appliances for getting a boat into the water must fulfil the following conditions: Means are to be provided for speedily detaching the boats from the lower blocks of the davit tackles; the boats placed under davits are to be attached to the davit tackles and kept ready for service at any moment; the davits are to be strong enough and so spaced that the boats can be swung out with facility; the points of attachment of the boats to the davits are to be sufficiently away from the ends of the boats to insure their being easily swung clear of the davits; the boats' chocks are to be such as can be expeditiously removed; the davits, falls, blocks, eye-bolts, rings, and the whole of the tackling are to be of sufficient strength; the boats' falls are to be long enough to lower the boat into the water with safety when the vessel is light; the life-lines fitted to the davits are to be long enough to reach the water when the vessel is light; and hooks are not to be attached to the lower tackle blocks.

6. *Equipments for Collapsible or other Boats and for Life-rafts.*—In order to be properly equipped each boat shall be provided as follows:—

(*a.*) With the full [single-banked] complement of oars, and two spare oars.

* See p. 218.

(*b.*) With two plugs for each plug-hole, attached with lanyards or chains, and one set and a-half of thole pins or crutches, attached to the boat by sound lanyards.

(*c.*) With a sea anchor, a bailer, a rudder and tiller, or yoke and yoke-lines, a painter of sufficient length, and a boat-hook. The rudder and bailer to be attached to the boat by sufficiently long lanyards, and kept ready for use.

(*d.*) A vessel to be kept filled with fresh water shall be provided for each boat.

(*e.*) Life-rafts shall be fully provided with a suitable equipment.

7. *Additional Equipments for Boats of Section* (A) *and Section* (B).—In order to be properly equipped, each boat of sections (A) and (B), in addition to being provided with all the requisites laid down in 6, shall be equipped as follows [but not more than four boats in any one ship require to have this outfit]:—

(*a.*) With two hatchets or tomahawks, one to be kept in each end of the boat, and to be attached to the boat by a lanyard.

(*b.*) With a mast or masts, and with at least one good sail, and proper gear for each.

(*c.*) With a life-line, in loops run round the outside of the boat and securely made fast.

(*d.*) With an efficient compass.

(*e.*) With 1 gallon of vegetable or animal oil, in a vessel of an approved pattern, for distributing it in the water in rough weather.

(*f.*) With a lantern trimmed, with oil in its receiver sufficient to burn eight hours.

8. *Number of Persons for Life-Rafts.*—The number of persons that any approved life-raft for use at sea shall be deemed to be capable of carrying shall be determined with reference to each separate pattern approved by the Board of Trade; provided always that for every person so carried there shall be at least 3 cubic feet of strong and serviceable inclosed air-tight compartments, such that water cannot find its way into them. Any approved life-raft of other construction may be used, provided that it has equivalent buoyancy to that hereinbefore described. Every such approved life-raft shall be marked in such a way as to plainly indicate the number of adult persons it can carry.

9. *Buoyant Apparatus.*—Approved buoyant apparatus shall be deemed sufficient for a number of persons, to be ascertained by dividing the number of pounds of iron which it is capable of supporting in fresh water by 32. Such buoyant apparatus shall not require to be inflated before use, shall be of approved construction, and marked in such a way as plainly to indicate the number of persons for whom it is sufficient.

10. *Life-Belts.*—An improved life-belt shall mean a belt which does not require to be inflated before use, and which is capable at least of floating in the water for twenty-four hours with 10 lbs. of iron suspended from it.

11. *Life-Buoys.*—An approved life-buoy shall mean either—

(*a.*) A life-buoy built of solid cork and fitted with life-lines and loops securely seized to the life-buoy, and capable of floating in the water for at least twenty-four hours with 32 lbs. of iron suspended from it; or

(*b.*) A strong life-buoy of any other approved pattern and material, provided that it is capable of floating in the water for at least twenty-four hours with 32 lbs. of iron suspended from it, and provided also that it is not stuffed with rushes, cork shavings, or other shavings, or loose granulated cork, or other loose material, and does not require inflation before use.

12. *Position of Life-Belts and Life-Buoys.*—All life-buoys and life-belts shall be so placed as to to be readily accessible to the persons on board, and so that their position may be known to those for whom they are intended.

Appendix (D).

Report of Committee on Life-Saving Systems and Devices.

Cabinet du Ministre.

2e Bureau: Mouvements de la Flotte et Opérations Militaires.

Au Sujet du Filage de l'Huile.

Le Ministre de la Marine et des Colonies à MM. les Vice-Amiraux Commandant-en-chef, Préfets Maritimes, Officiers Généraux, Supérieurs et autres, Commandant à la Mer.

Messieurs, *Ministère de la Marine et des Colonies, Paris, le 6 Août*, 1887.

L'ATTENTION du Département a été appelé à diverses reprises sur la question de l'emploi de l'huile pour diminuer les effets d'une mer agitée.

Le Vice-Amiral Cloué a notamment résumé ses recherches et ses observations dans un intéressant Mémoire inséré dans les "Annales Hydrographiques" et dans "La Revue Maritime et Coloniale" en 1887, et auquel je vous prie de vous reporter.

La diffusion de l'huile sur une grosse mer paraît exercer parfois des effets surprenants, et je suis frappé, comme le Vice-Amiral Cloué, des résultats qui auraient été obtenus dans certaines circonstances. Je désire, en conséquence, faire procéder à l'étude de ce phénomène, et, afin de m'appuyer sur des données précises et revêtues d'un caractère officiel, je vous prie de faire exécuter, à bord des

bâtiments sous vos ordres des essais sur le filage de l'huile dans les diverses circonstances de la navigation.

Vous voudrez bien m'adresser ultérieurement un compte rendu détaillé de ces expériences en me faisant part de vos appréciations sur l'application qui pourrait être faite dans la pratique du principe dont il s'agit pour la préservation des navires ou des embarcations.

Je ne crois devoir vous donner aucune instruction de détail ; vous trouverez, dans le Mémoire du Vice-Amiral Cloué, les indications nécessaires pour vous guider.

Recevez, &c.
(Signé) BARBEY.

CABINET DU MINISTRE.

2e Bureau : Mouvements de la Flotte et Opérations Militaires.

AU SUJET DU FILAGE DE L'HUILE.

Le Ministre de la Marine et des Colonies à MM. les Vice-Amiraux Commandant-en-chef, Préfets Maritimes, Officiers Généraux, Supérieurs et autres, Commandant à la Mer.

Messieurs, *Paris, le 13 Octobre,* 1888.

Comme suite à la Circulaire du 6 Août, 1887, j'ai l'honneur de vous adresser ci-jointe une note sur le filage de l'huile rédigée d'après les indications du Vice-Amiral Cloué, et qui paraît un complément utile de l'ouvrage sur la matière déjà délivré à tous les bâtiments de l'État aux termes de la Circulaire du 14 Juin, 1888.

Plusieurs des opérations qui y sont décrites n'ont pas encore reçu, tout au moins dans une mesure suffisante, la sanction de l'expérience, et sont simplement signalées sur la proposition de cet officier général, à l'attention des navigateurs.

Il importe, en vue de l'étude complète de cette intéressante question, de continuer activement les essais et de rechercher tous les perfectionnements réalisables.

Je désire, en conséquence, que les Commandants continuent à employer ce procédé, lorsque les circonstances de leur navigation s'y prêteront, en tenant compte des recommandations de la note ci-jointe.

Ils devront noter avec soin toutes les applications qu'ils auront pu faire, en indiquant les moyens mis en usage, la durée de l'immersion des sacs, l'espèce et la quantité d'huile employée, la route du navire, la direction et la force du vent, et celles de la mer, &c.

Tous ces renseignements, ainsi que les résultats obtenus, devront être résumés dans un Rapport qui me sera transmis sous le présent timbre, à la date du 1er Janvier et du 1er Juillet de chaque année, ou au désarmement du bâtiment.

Recevez, &c.
(Signé) KRANTZ.

NOTE SUR LE FILAGE DE L'HUILE.

Une étude attentive des résultats obtenus dans les nombreuses expériences qui ont eu lieu sur le filage de l'huile pour calmer les brisants a permis d'établir les meilleures conditions dans lesquelles ce mode de protection peut être utilement employé.

La note ci-après, qui indique l'état actuel de la question, est divisée en trois parties, savoir :—

1. Mode d'emploi de l'huile.
2. Huiles à employer.
3. Circonstances dans lesquelles l'usage de l'huile est recommandé.

1. *Mode d'Emploi de l'Huile.*

On a reconnu qu'une très petite quantité d'huile permet de couvrir une grande étendue d'eau d'une pellicule grasse suffisante pour empêcher les brisants de se former. Il a même été constaté que l'huile employée ainsi par petites quantités produit l'effet le meilleur et le plus prompt, les gouttes d'huile s'étendant sur l'eau avec une rapidité prodigieuse. Il est donc nécessaire d'égoutter l'huile, et le moyen qui a été reconnu jusqu'ici comme le plus simple et devant être préféré est l'emploi de sacs de forme allongée faits avec de la toile à voile. On prend, par exemple, un de ces sacs que l'on remplit d'étoupe saturée d'huile, on complète en versant de l'huile par-dessus l'étoupe, on forme avec soin le sac, qui doit être solidairement ralingué, et on le met à la traîne à l'aide d'un cartahu frappé sur une cosse tenant, du côté de l'ouverture ralingué du sac. Le fond et la partie postérieure du sac sont percé de trous faits à l'aide d'une grosse aiguille à voile.

Pour que les sacs puissent rester trois ou quatre heures à la mer avant qu'il soit nécessaire de les remplacer, il faut que leur capacité soit d'une dizaine de litres, en tenant compte du volume occupé par l'étoupe. Il n'y donc pas dans chaque sac beaucoup plus de 5 à 6 litres d'huile.

A l'ancre ou à la cape, la forme des sacs importe peu ; des navires et des embarcations ont employé un simple bas avec un plein succès. Mais il n'en saurait être de même lorsque le bâtiment a de la vitesse ; la forme allongée est alors la meilleure, comme, par exemple, celle d'une gargousse de canon ou même celle d'un très gros saucisson.

Les cuvettes des poulaines ont été utilisées avec profit, concurremment avec les sacs à huile et

même sans eux. On les remplit, comme les sacs, d'étoupe saturée d'huile sur laquelle on verse ensuite quelques litres d'huile. On a obtenu un très bon résultat en laissant pendre sous les poulaines des lanières d'étoupe, sortes de morceaux de faubert, à travers lesquelles l'huile suintait jusqu'à la mer.

2. *Huiles à Employer.*

Il y a lieu de signaler la supériorité reconnue des huiles de poisson, et en premier lieu de celles de baleine. Les huiles d'olive, de colza, de lin, de sésame, ne viennent qu'en seconde ligne.

Les huiles de coco, se figeant très vite, ne peuvent pas être employées avec succès dans les hautes latitudes.

Les huiles minérales sont inférieures aux autres comme trop légères ; elles ont cependant donné quelquefois de bons résultats.

En général, les huiles un peu épaisses et visqueuses, telles que celles provenant des résidus de machines à vapeur et de machines-outils dans les usines, produisent de très bons effets ; les essences de térébenthine, et même de vernis, ont été employés aussi avec un certain succès. Cependant, il ne faut pas que les matières grasses cessent d'être parfaitement liquides ; il serait mauvais de prendre celles qui se présenteraient sous la forme de cambouis ; de nombreuses expériences ont prouvé que le suintement se fait alors difficilement et que les gouttes d'huile trop épaisse sont bien plus longues que les autres à s'étendre sur l'eau ; l'effet produit est alors inutile, car le navire s'est déjà éloigné quand la zone de protection est établie.

3. *Circonstances dans lesquelles l'Usage de l'Huile est recommandé.*

Les diverses circonstances de mer dans lesquelles l'usage de l'huile peut être utile sont les suivantes :—

1.	A l'ancre...	Navire ou bateau mouillé.
		„ „ amarré bord à quai.
2.	A la mer...	Navire vent arriéré.
		„ „ de la hanche
		„ „ largue ou du travers.
		„ „ debout.
		„ à la cape ou en dérive sans voiles.
3.	... ...	Embarcation ou bateau de sauvetage à la mer en marche.
		Embarcation ou bateau capeyant sur une ancre flottante.
4.	... ...	Mettre à la mer une embarcation pour sauvetage et la rehisser à bord par gros temps.
5.	....	Franchir une barre.
6.	... ...	Remorquage.

1. *Navires à l'Ancre.*

Lorsqu'un navire se trouvera au mouillage dans un endroit non abrité, il pourra, dès que la mer commencera à se lever, fouetter une poulie double sur la chaîne, en dehors de l'écubier, passer dans chaque clan de la poulie un cartahu, puis filer 15 ou 20 mètres de chaîne et amarrar à l'un des cartahus une bouée portant un sac à huile.

Un hâle-à-bord frappé sur la bouée donnera le moyen de renouveler le sac lorsqu'on le jugera nécessaire, et le second cartahu permettra de faire rapidement cette opération. Si le navire est pourvu d'un beaupré et à plus forte raison d'un bout dehors de foc assez long, il sera probablement suffisant de suspendre le sac à son extrémité jusqu'à toucher l'eau.

Lorsqu'une embarcation affalee à la côte sera forcée de mouiller pour faire tête à la mer, elle pourra prendre la précaution de frapper sur son câblot, près du grappin, une poulie munie d'un va-et-vient, sur lequel sera fixé un sac à huile.

Si le navire (ou l'embarcation) était amarré à un quai exposé à être battu par la mer, on pourrait élonger dans le vent un grappin ou une ancre légère, portant la poulie avec le va-et-vient. On obtiendra le meilleur résultat en halant près de l'ancre ou du grappin une bouée portant un sac à huile. En effet, si le sac était fixé près de l'ancre, par une profondeur de quelques mètres, l'huile devrait, avant de s'étendre, employer un certain temps pour remonter à la surface, et ce temps serait perdu pour l'effet qu'on désire produire.

Afin d'être sûr d'avoir toujours en place un sac à huile fonctionnant bien, il est entendu que la poulie tenant à l'ancre doit être double et munie par conséquent de deux cartahus, de manière qu'on puisse envoyer un sac à huile auprès de la poulie au moment ou l'autre est hâlé à bord.

2. *Navires à la Mer.*

Navires Vent Arrière.—Lorsqu'un navire fuyant devant le temps risque de recevoir par l'arrière un dangereux coup de mer, il pourra pendre à l'avant, à chaque bossoir, un sac à huile touchant l'eau. L'avant du navire, en fendant la mer, la repousse de chaque côté, et l'huile étendue à la surface forme le long du bord une bande unie large de plusieurs mètres et une sorte de chemin huileux derrière le navire.

Si ces deux sacs étaient insuffisants, ce qui est peu probable, on devrait pendre deux autres sacs vers les grands porte-haubans, un de chaque bord.

Sur les bâtiments à hélice, on ne doit jamais prendre les sacs à la poupe, de peur qu'ils ne s'engagent dans le propulseur.

Navires Vent de la Hanche, Vent Largue, Vent de Travers.—Il faut, dans ce cas, établir un brise-lames huileux à quelques mètres, parallèlement au navire. Dans ce but, on établit au bossoir un espars ou arc-boutant faisant saillie de 6 ou 8 mètres en dehors ; on a eu soin de fouetter sur son extrémité une poulie double dans laquelle passent deux légers cartahus, remorquant chacun un sac à huile, ce qui permet d'en avoir toujours un dehors.

Si, avec une grosse mer du travers, l'espars ne suffisait pas pour écarter suffisamment la bande d'huile, on emploierait un flotteur divergent portant un sac à huile. Il y a lieu de supposer que ce moyen suffirait même avec une grosse mer venant un peu de l'avant du travers.

Avec certaines mers fortes, lorsque le navire a une très grande vitesse, la mise en place de l'arc-boutant peut être très difficile et, si l'on s'y prend un peu tard, elle peut même être dangereuse. Il y aurait sans doute avantage, dans ce cas, à utiliser la vergue de misaine brassée convenablement.

Autant que possible, il faut que les sacs soient disposés de manière à traîner sur l'eau sans sauter ; il faut aussi éviter qu'ils ne plongent trop, car l'huile ne s'étend et ne produit son effet qu'à la surface, et le temps qu'elle emploierait à y remonter serait du temps perdu.

Navires Vent Debout ou presque Vent Debout.—Plusieurs navires filant 10 ou 11 nœuds contre un gros temps ont réussi à se préserver des coups de mer en suspendant simplement des sacs à huile à l'avant ou en faisant égoutter de l'huile par les poulaines. Ce procédé, qui a réussi à un très petit nombre de capitaines, ne serait certainement pas suffisant pour tous les navires ; il pourrait être remplacé par le suivant : établir à l'avant une pompe puissante capable de lancer contre un coup de vent, à une quinzaine de mètres de distance, un jet d'eau *dense* vent contenant quelques gouttes d'huile. Au besoin, on s'aiderait d'un fort espars s'avançant en dehors et contre lequel s'appuierait le tuyau de la pompe. L'expression *dense* veut dire que le jet reste cylindrique depuis sa sortie du tuyau jusqu'à l'eau ; autrement le vent renverrait l'eau à bord.

La pompe lancerait, par exemple, 1,000 litres d'eau à la minute, et un petit méchanisme introduirait, avant que le jet ne sorte du tuyau, 3 ou 4 centilitres d'huile à la minute, ce qui ferait une consommation de 1 lit. 80 à 2 lit. 40 d'huile à l'heure. L'huile, en arrivant à la surface de la mer, prendra sans doute sa place immédiatement.

Navires à la Cape ou en Dérive sans Voiles.—Bien des navires ont obtenu un excellent résultat à la cape en suspendant un sac à huile au bossoir du vent. Cependant il serait peut-être utile, sur un grand navire, de suspendre à l'eau le long du bord plusieurs sacs à une quinzaine de mètres l'un de l'autre.

Lorsqu'un bâtiment à vapeur fait une avarie grave de machine, il tombe en travers et reste dans cette position, surtout s'il est très long ; c'est alors une épave exposée à tous les coups de mer.

Pour le préserver des paquets de mer qui pourraient embarquer, on peut pendre du côté du vent des sacs à huile distants entre eux d'environ 15 mètres en ayant soin de les renouveler de deux en deux toutes les trois ou quatre heures. Si le vent renvoyait les sacs à bord, même lestés, il suffirait de les pendre sous le vent ; la dérive ne tarderait pas à faire passer le champ d'huile au vent.

3. *Embarcation ou Bateau de Sauvetage à la Mer en Marche.*

Une embarcation, un bateau de sauvetage, par exemple, peut marcher entre certaines mauvaises mers avec succès en plaçant droit devant un espars portant un sac à huile. Mais cette manœuvre ne peut pas toujours réussir, et comme il n'est pas probable qu'on puisse installer sur un aussi petit bâtiment la pompe dont on a parlé plus haut, les embarcations légères devront renoncer à affronter de fortes mers debout.

Une embarcation, un bateau non ponté, fuyant vent arrière devant la lame, pourra suspendre son sac à huile à l'avant, à l'extrémité d'un espars et traînant légèrement à l'eau, ou bien près de l'arrière de manière à ne pas l'engager dans le gouvernail.

Une embarcation, un bateau de sauvetage peut marcher avec grosse mer du travers en employant un espars orienté à 45° de la direction de l'avant et traînant un sac à huile dont la remorque passe dans une poulie fixée à l'extrémité de cet espars.

Embarcation capeyant sur une Ancre Flottante.

Lorsqu'une embarcation isolée est surprise par un fort vent qui ne lui permet plus de porter de la voile, et est menacée par une grosse mer sur une eau trop profonde pour mouiller, elle peut avoir recours à une ancre flottante sur laquelle elle s'amarre et à l'abri de laquelle elle peut dériver. Cette ancre flottante est ordinairement faite avec une drome composée des mâts, vergues, et même des avirons. Il est souvent utile de laisser prendre à l'eau, sous cette drome, une des voiles de l'embarcation, et d'en retenir la partie inférieure à l'aide d'une écoute venant à bord. Un sac à huile peut être installé sur l'ancre flottante à l'aide d'une poulie dans laquelle passe un va-et-vient, de manière à pouvoir facilement changer le sac lorsque l'huile s'épuise.

4. *Mettre une Embarcation à la Mer et la rembarquer par Gros Temps.*

Voici à ce sujet la manœuvre recommandée. Cette opération ne devra se faire que protégée par un champ d'huile qui écarte tout brisant. L'embarcation devra, en outre, être munie de tout le gréement nécessaire au filage de l'huile.

Sur un Bâtiment à Vapeur.—Le navire étant stoppé ne tardera pas à venir en travers au vent ; il sera probablement plus avantageux d'amener l'embarcation du côté du vent, à cause de la dérive du navire qui laissera au vent le champ d'huile.

Sur un Bâtiment à Voiles.—Le navire en panne donne nécessairement une forte bande. On devra probablement amener le canot sous le vent. Il faudrait alors mettre les sacs à huile à l'eau de ce côté. Les mouvements du navire feront sans doute assez élargir le champ d'huile pour que l'embarcation soit mise à l'eau sur une mer sans brisants. On pourrait, du reste, avec un espars muni d'un sac, élargir la bande d'huile sous le vent de manière à avoir un espace uni suffisant pour l'embarcation.

5. *Franchir une Barre.*

La meilleure méthode à employer est d'avoir un sac à huile pendu à l'extrémité de l'espars poussé droit devant, et un autre sac à la remorque à l'arrière, de manière qu'il ne puisse se prendre dans le gouvernail ou dans l'hélice, s'il s'agit d'une embarcation à vapeur.

6. *Remorquage.*

Le filage de l'huile sera alors un puissant auxiliaire, car si le remorqueur ne parvient pas à se garantir complètement des coups de mer par l'avant, il sera en très bonne position pour filer l'huile de manière à en garantir entièrement le remorqué, ce qui allégera beaucoup le travail des remorques en leur évitant les secousses qui les compromettent et qui fatiguent, en outre, l'arrière du remorqueur et l'avant du remorqué.

Appendix (E).

Report of Committee on Life-Saving Systems and Devices.

Organization and Methods of the United States' Life-Saving Service.

Read to the Committee on Life-Saving Systems and Devices, International Marine Conference, November 22, 1889, by S. I. Kimball, General Superintendent of the Service.

THE sea and lake coasts of the United States, exclusive of the coats of Alaska, have an extent of more than 10,000 miles. There are to-day upon these coasts 226 life-saving stations, 165 of which are on the shores of the Atlantic, 8 on the shores of the Gulf of Mexico, 8 on the shores of the Pacific, and 45 on the shores of the Great Lakes. There is, besides, a station at the falls of the Ohio River, at Louisville, Kentucky. These stations are located at selected points of danger to shipping, and vary somewhat in character, according to their environment and the nature of the service demanded of them. On some portions of the coast they are placed only at long intervals, while upon others they form chains of contiguous posts within communicating distance of each other.

From the eastern extremity of the coast of Maine to Race Point on Cape Cod, a distance of 415 miles, there are but 16 stations, 10 of these being located at the most dangerous points on the coasts of Maine and New Hampshire, which, although abounding with rugged headlands, islets, rocks, reefs, and intricate channels that would naturally appear to be replete with dangers, are provided with numerous harbours and places of shelter in which, upon short notice, vessels can take refuge. The portion of the Massachusetts coast included, although less favoured with safe resorts, enjoys the excellent guardianship of the Massachusetts Humane Society—a venerable institution, operating under the volunteer system. On account of this protection, the General Government has deemed it proper to place its stations within this territory only at points where wrecks are unusually frequent: at least until other dangerous parts of the coast shall have been provided for.

Cape Cod, a narrow strip of sand, stretches directly out into the ocean some 40 miles, then abruptly turns to the north for an equal distance, and, like a threatening arm, fiercely menaces the commerce of the principal port of New England. Its eastern borders of shifting sand-bars fringe an unbroken line of sandy beaches which have become the burial-ground of unnumbered craft. Here 10 stations are located, nearly equi-distant, and designed to co-operate with each other.

From Monomoy—the elbow of the Cape—to Montauk Point, a distance of 110 miles, the coast is again somewhat similar to that of Maine, and is provided with but 9 stations.

The ocean shores of Long Island and New Jersey, one about 120, and the other 130, miles in length, form nearly a right-angle, one side of which faces south-easterly and the other easterly, the vertex being at the entrance to the harbour of the great commercial metropolis of the nation. The southern portion of the New Jersey coast also borders the entrance to Delaware Bay, which is traversed by the shipping of Philadelphia and Wilmington. The coast-line throughout nearly its whole extent consists of a narrow strip of sand-beach, varying in width from a quarter of a mile to 5 miles, and separated from the mainland by narrow thoroughfares that sometimes expand into considerable bays. This strip is unbroken except by shallow inlets connecting the ocean with the inland waters, and by the entrance to New York Harbour, as before stated. At a distance of from 100 to 400 yards from the shore, it is bordered by outlying sand-bars, over which in violent storms immense walls of surf continually form and break. Its shores, exposed to all easterly storms, are constantly skirted by vessels bound into and out of the ports of New York, Philadelphia, and Wilmington, and by craft of the coasting trade. Their sands have always levied a fearful tribute upon the passing commerce, and are literally strewn with the

half-buried and decaying skeletons of wrecked vessels, while the graveyards of the coast villages and Settlements abound with unmarked mounds that tell a sorrowful tale of the destruction of human life. Here, therefore, the number of stations is increased, 39 being placed upon the coast of Long Island and 40 upon the New Jersey coast.

A similar formation marks the coast from Cape Henlopen to Cape Charles, and from Cape Henry to Cape Fear. On the first of these sections, a distance of 116 miles, 16 stations are located, while from Cape Henry to Cape Hatteras, a stretch of 121 miles, there are 23 stations. These guard a portion of the ocean commerce of Philadelphia, all that of Baltimore and Norfolk, and the coastwise shipping.

Between Cape Hatteras and Cape Fear—175 miles—6 stations are placed for the protection of the commerce of Beaufort and Wilmington, North Carolina, and for the benefit of coasting vessels liable to disaster upon these stormy capes.

From Cape Fear as far south as the Peninsula of Florida there are no stations, with the exception of one on Morris Island, at the entrance to Charleston Harbour, their protection not being needed, for the reason that the westerly trend of the coast from Cape Hatteras to Florida takes it distant from the track of vessels not bound to or from the local ports. The climate is also much milder than in the higher latitudes, being almost perennial summer; consequently shipwrecks are less frequent.

On the coast of Florida when vessels strand they usually come well up to the shore, so that sailors find little difficulty in reaching the land. Until of late, however, these shores were almost uninhabited, and mariners cast upon them were exposed to the terrors of starvation and thirst. On this account there are provided for their relief 10 stations of an exceptional type, denominated houses of refuge. There is, however, a completely equipped station at Jupiter Inlet, a somewhat dangerous point.

Along most of that portion of the coast of the Gulf of Mexico lying within the United States, the water is shoal for a great distance from shore, the soundings regular, and the coast-line generally low, marshy, or sandy. The dangerous gales are the "northers," so well known to seamen who frequent the Gulf, and these force vessels off and not on shore, except where a portion of the coast of Texas runs nearly north and south. This portion is exposed to the effects of these storms, especially if the wind is a little quartering from the east, and here are appropriately established 4 stations. There is also a station at the entrance to Galveston Harbour, where many vessels have been wrecked upon the bar, and at unusually exposed points 2 others.

The Pacific coast is not a dangerous one. From the southern boundary of the United States as far north as San Francisco the climate is remarkably bland, and shipwrecks are of rare occurrence. The remainder of the coast-line extending northward to the Straits of Fuca is very regular, bold, and unbroken, and contains but few harbours. The prevailing winds are mostly from a common quarter, blowing not towards the shore, but southward, along its line, with almost the regularity of monsoons. The weather, therefore, is easily forecast, and navigation cannot in general be regarded as hazardous. There are, however, a few extremely dangerous points, mostly situated at the entrances to the important ports. These are guarded by 8 stations.

The cluster of inland seas known as the Great Lakes contains an area of about 80,000 square miles, and has a coast-line within the limits of the United States of nearly 2,500 miles. These seas are open to navigation about eight months in the year; at other times being closed by ice, although one or two steamers cut their way across Lake Michigan at intervals throughout the winter. There are few natural harbours, but a large number of artificial ones. These are formed at the mouths of rivers by extending piers from their banks out into the lake for a considerable distance and dredging the bottom between. The lakes are generally tranquil, but at certain seasons are visited by violent gales, which throw their fresh waters into furious convulsion with a suddenness unknown upon the ocean. Vessels unable to hold their own against the severity of these storms, being land-locked and with scant sea-room, are likely to be left with only the choice between stranding wherever they may be driven and seeking refuge in the harbour that seems most accessible. The latter course is naturally the one taken. To effect an entrance within the narrow space between the piers at such times, with sailing-vessels, and even with steamers, is frequently a task of extreme difficulty, and the luckless craft are liable to strand upon the bar on one or the other side of the piers, and meet their destruction. At some of these harbours many disasters occur in a single day.

The numerous severe gales attending the opening and closing of navigation in the early spring and late fall cause great numbers of wrecks from the enormous shipping of the lakes. As the strandings usually occur near the harbours, however, the number of stations required is not so large as it would be if they were distributed more generally along the shore. The number at present is, as I have stated, 45.

At Louisville, Kentucky, dangerous falls occur in the Ohio River, across which a dam has been constructed with two wide openings or chutes to facilitate the descent of vessels, the ascent being accomplished through a canal provided with locks. This dam is a source of danger to boats attempting to cross the river to the city of Jeffersonville, as they are liable to be sucked down by the chutes or swept over its verge. Larger vessels are also exposed to danger if they become disabled or unmanageable. For this reason it has been found advisable to moor here a floating station of a unique character.

The remaining few stations are located at various points which have seemed to need their protection. There are eight stations now in course of construction, and twenty others authorized to be hereafter built at various isolated points of danger. When these are completed, this form of protection will have about reached the practical limit of the present necessities of our commerce.

The stations upon the ocean beaches are generally situated among the low sand-hills common to such localities, sufficiently back of high-water mark to be safe from the reach of storm-tides. They are plain structures designed to serve as barracks for the crews, and to afford convenient storage for the boats and apparatus. Most of those upon the Long Island and New Jersey coasts have been enlarged from the boat-houses put up to shelter the boats and equipments provided for the use of volunteers before regular crews were employed. Those built later are more comely in appearance, while a few

located conspicuously at popular seaside resorts, make some pretensions to architectural taste. They are all designated by names indicating their localities.

In the majority of stations the first floor is divided into four rooms: a boat-room, a mess-room (also serving for a sitting-room for the men), a keeper's room, and a store-room. Wide, doubled-leafed doors and a sloping platform, extending from the sills to the ground, permit the running out of the heavier equipments from the building. The second story contains two rooms: one is the sleeping-room of the men, the other has spare cots for rescued people, and is also used for storage. The more commodious stations have two additional rooms—a spare room and a kitchen. In localities where good water cannot be otherwise obtained, cisterns are provided for water caught from the roof. There surmounts every station a look-out or observatory, in which a day-watch is kept. The roofs upon the stations on those portions of the coast exposed to view from the sea are usually painted dark red, which makes them distinguishable a long distance off shore. They are also marked by a flag-staff 60 feet high, used in signalling passing vessels by the International Code.

The stations (other than the houses of refuge) are generally equipped with two surf-boats (supplied with oars, life-boat compass, and other outfits), a boat-carriage, two sets of breeches-buoy apparatus—including a Lyle gun and accessories—a cart for the transportation of the apparatus, a life-car, twenty cork-jackets, two heaving-sticks, a dozen Coston signals, a dozen signal-rockets, a set of the signal-flags of the International Code, a medicince-chest with contents, a barometer, a thermometer, patrol lanterns, patrol checks or patrol clocks, the requisite furniture for rude housekeeping by the crew and for the succour of rescued people, fuel and oil, tools for the repair of the boats and apparatus and for minor repairs to the buildings, and the necessary books and stationery. At some of the stations the Hunt gun and projectiles are supplied, and at a few the Cunningham rocket apparatus. To facilitate the transportation of boats and apparatus to scenes of shipwreck, a pair of horses is also provided at stations where they cannot be hired, and to those stations where the supplies, mails, &c., have to be brought by water a supply-boat is furnished.

All the stations on the ocean coast of Long Island, 29 stations on the coast of New Jersey, 9 stations on the coast between Cape Henlopen and Cape Charles, and all the stations between Cape Henry and Hatteras Inlet are connected by telephone lines.

The few lake stations located upon the sand-beaches are similar in all respects to those upon the sea-coast, but those situated at the harbours differ from them, in that room is provided for a heavy life-boat and for a small boat for quick work in the immediate vicinity of the station. The buildings are usually located not far from the water's edge, behind one of the piers of crib-work forming the sides of the harbour entrance. An inclined platform, upon which are laid two tramways for the launching of the boats, extends from the boat-room down to the water through an opening cut in the pier. Cradles or cars are provided on which the boats are kept mounted, and by which they can be put afloat with the men at their oars in half a minute. Exit for the surf-boat waggon and apparatus-cart is also provided in the rear of the building, in case it should be necessary to transport them along the shore. These stations usually have telephone connection with the systems of the adjacent towns.

The houses of refuge on the Florida coast are simple dwellings, not unlike those common at the south, with capacity sufficient for the residence of a family, and for the temporary shelter of as many as are likely to need it. The distance between them averages 26 miles, and at each mile along the coast are placed guide-posts indicating the distance and direction to the nearest station. The houses are supplied with cots and provisions sufficient to succour twenty-five persons for ten days. No boats or apparatus are provided except a small galvanized iron boat for the use of the keeper.

The floating station at Louisville is a scow-shaped hull, on which is a house of two stories, surmounted by a look-out. Besides the housekeeping furniture there are but few equipments; two boats called life-skiffs, and two reels, each with capacity to hold a coil of 5-inch Manila rope, and so placed in the boat-room that a line can be speedily run out from either, or, if desired, that they can be rolled out of the boat-room, with the lines upon them, for use elsewhere. The station is usually moored above the dam at a place which will afford the readiest access to boats meeting with accident, but it can be towed from place to place when necessity requires, as was the case in the great floods of 1883–84, when it was of incalculable service in rescuing people from the upper stories and roofs of their inundated dwellings, and in distributing food to the famishing. On these two calamitous occasions the crew of this station rescued and took to places of safety over 800 imperilled persons, men, women, and children—among them many sick and infirm—and supplied food and other necessaries to more than 10,000.

The station buildings upon the coast are all constructed with a view to withstand the severest tempests. Those located—as many necessarily are—where they are liable to be undermined or swept from their positions by the ravages of storms and tidal waves, are so strongly put together that they may be overthrown and sustain but trifling injury. There are instances on record where they have been carried a long distance inland—in one case a half-a-mile—without sustaining material damage. This substantial construction also enables them to be easily and cheaply moved when threatened by the gradual encroachment of the sea, which, upon many sections of the coast, effects in the course of years great changes in the configuration of the coast-line.

Since the establishment is closely related to commerce and the collection of the revenue, it is attached to the Treasury Department, which discharges all executive functions of that character. It has, indeed, from its earliest inception, been formed and fostered by that Department. The present system was established in 1871 upon the New Jersey and Long Island coasts by a Code of Regulations under the authority of somewhat scattered and fragmentary legislation. Acts of Congress passed since that time have extended it to embrace the entire ocean and lake coasts, which are divided into twelve districts limited in general by prominent natural or political boundaries.

The chief officer of the Service is the General Superintendent, whose appointment is made by the President, and confirmed by the Senate. No one is eligible to the position who is not familiar with the means employed in the Service for the saving of life and property from shipwreck. The law places no

limit upon the tenure of this officer, which is therefore subject to the pleasure of the President. He has general charge of the Service and of all administrative matters connected with it. His compensation is 4,000 dollars per annum. An Assistant General Superintendent, appointed by the Secretary of the Treasury, assists him, and in his absence performs his duties. His compensation is 2,500 dollars per annum.

The office of the General Superintendent is in Washington, where, to assist in the transaction of business, are employed a corps of clerks, a civil engineer, a topographer and hydrographer, and a draughtsman. To assist the General Superintendent in investigating devices and inventions for the improvement of life-saving apparatus, there has been formed a Board on Life-Saving Appliances, composed of experts selected from the Life-Saving Service and others. It is their duty to examine and report upon such devices as may be submitted to them.

The next official in rank to the General Superintendent is the Inspector, an officer detailed from the Revenue-cutter Service upon the request and recommendation of the General Superintendent. His head-quarters are in New York city. Besides making periodical inspections of the stations, he performs such other duties in connection with the conduct of the Service as the General Superintendent may direct. Nearly all the self-bailing and self-righting life-boats are built in New York, and most of the apparatus is manufactured there. He is, therefore, required to inspect and superintend the work upon these. Under the system pursued by the Government for making purchases of goods for its use, a large proportion of the outfits and supplies for the stations are obtained in that city, and these he is also required to inspect. An Assistant Inspector is detailed to the office of the Inspector, and in his absence acts for him. Such other assistance as is found necessary is also allowed.

An Assistant Inspector is also detailed from the Revenue-cutter Service for each district. He is authorized to perform within his district any of the duties of the Inspector under the latter's direction. He visits each station monthly during the "active season," and upon each visit, in addition to the ordinary routine of inspection, he examines and practises the crews in their duties. On his first tour after the opening of the stations in each year he examines the keepers and men as to the required qualifications, reporting for dismissal any found wanting. Upon each succeeding visit he makes a similar examination of all persons who have entered the Service during his previous visit. He makes special visits to any of the stations when necessary. Whenever a shipwreck attended with loss of life occurs within the domain of the Service, an Assistant Inspector is detailed to carefully investigate all the circumstances connected with the disaster, with a view of ascertaining its cause, and whether the officers or employés of the Service have been guilty of neglect or misconduct. The results of these investigations are published in the annual Reports. The Inspector and Assistant Inspectors receive no other compensation than that pertaining to their rank in their own corps.

Each district is under the immediate charge of a Superintendent, and for the coast of Rhode Island—a portion of the Third District, widely separated by water from the other portion and from the adjacent district, but not large enough to form a district by itself—there is an Assistant Superintendent. These officers must be men of good character and correct habits, not less than 25 nor more than 55 years of age when appointed, able to read and write English readily, and have sufficient knowledge of accounts to properly transact the district business. They must be residents of the respective districts for which they are chosen, familiar with the line of coast embraced within them, and conversant with the management of life-boats and other life-saving appliances. They are rigidly examined as to these qualifications by the General Superintendent and the Inspector. They are disbursing officers and paymasters for their respective districts, and are required to enter into bonds varying in amount from 10,000 to 50,000 dollars, according to the fiscal responsibility placed upon them. They are also *ex officio* Inspectors of Customs. They conduct the general business of their districts, look after the needs of the stations, make requisition on the General Superintendent for station supplies, repairs, &c., and upon receipt of authority see that these are furnished. They visit the stations at least once a quarter to acquaint themselves with their condition. On these occasions they pay off the crews and make such other disbursements as are authorized. As Inspectors of Customs they look after the interests of the Government in reference to dutiable property wrecked within their jurisdiction, and see that the keepers of stations perform their duties in respect thereto. Their compensation ranges from 1,000 to 1,800 dollars per annum, and is designed to be proportionate to the extent of their duties and to the degree of fiscal responsibility incumbent upon them severally.

Each station has a keeper who has direct control of all its affairs. The position held by this officer will be recognized at once as one of the most important in the Service. He is therefore selected with the greatest care. The indispensable qualifications for appointment are that he shall be of good character and habits, not less than 21 nor more than 45 years of age, have sufficient education to be able to transact the station business, be able-bodied, physically sound, and a master of boat-craft and surfing. He is usually nominated by the District Superintendent, the initial step being left to that officer because of the extensive acquaintance he is supposed to have with the class of men from which the choice must be made, by reason of long residence among them, and because of the degree of responsibility resting upon him for the condition and conduct of his district. So much depends, however, upon the selection, that an effort is made to eliminate, as far as possible, the chance that any political, social, or personal interests shall intentionally or unintentionally enter into it. In the vicinity of nearly all the stations there are numbers of fishermen and wreckers who have followed their callings from boyhood and become expert in the handling of boats in broken water, and among these there is usually some one who by common consent is recognized as a leader *par excellence*. He is the man it is desirable to obtain for keeper, unless there be some fault of character which should exclude him. The nomination is accompanied by a statement of the reasons that guided the District Superintendent in his choice and a certificate of the candidate's physical soundness, made by a surgeon of the Marine Hospital Service after careful examination. Before granting his approval the General Superintendent submits the nomination to the District Inspector for his views, and if after thorough inquiry he concurs, the General Superintendent approves and the appointment is made. If he does not concur, and his

tated reasons seem to justify his conclusion, the General Superintendent takes such action as he deems best, either calling upon the District Superintendent to submit another nomination, or visiting the locality himself and seeking out the proper person. It is gratifying to be able to state, and it is an evidence of the singleness of purpose and strict appreciation of duty which actuate both the district officers, that difference of opinion in reference to a nomination has rarely arisen between them.

It is not found difficult to fill vacancies that occur among the keepers at old stations, or along that portion of the coast where the stations are contiguous. Either from the crew where the vacancy exists, or from a neighbouring one, there is selected the most competent surfman, the merits of all having been ascertained by inspection and drill and recorded in the Central Office. Rarely it is considered for the best advantage and welfare of the Service to take some person from without; in which case the district officers are required to set forth specifically all the facts upon which this conclusion is based. The original selection of keepers for new stations remote from others is less easily determined.

The keepers are required to reside constantly at their stations, are intrusted with the care and custody of the station property, for which they are accountable, and govern the station premises. They are captains of their crews, exercise absolute control over them (subject only to the restriction of the Regulations of the Service and the orders of superior officers), lead them and share their perils on all occasions of rescue, taking always the steering oar when the boats are used, and directing all operations with the apparatus. They are also *ex officio* Inspectors of Customs, and as such take care of the Government interests in relation to dutiable goods on wrecked vessels, until the arrival of other Customs officers. By law they are also made guardians of all wrecked property until relieved by the owners or their agents, or until instructed by superior authority as to its disposition.

No crews are employed at houses of refuge, but the keepers and their families travel after storms as far as practicable along the shore in both directions from the stations, searching for persons possibly cast ashore.

A daily journal or log is required to be kept at every station, weekly transcripts of which the keeper sends through the District Superintendent to the General Superintendent, who is thus kept advised of all that transpires. Immediately after the occurrence of a wreck the keeper furnishes a complete Report of every detail of interest concerning the disaster, and from time to time various other Reports are required of him. Any false statement made in the books or Reports subjects him to instant dismissal.

The Secretary of the Treasury is authorized to grant the keepers a compensation not to exceed 800 dollars per annum. The maximum amount is paid only to one or two whose stations are so isolated that they are obliged to secure an associate to reside with them when the crews are off duty, and to such keepers as have remarkably distinguished themselves by bravery and effective service. The usual salary paid is 700 dollars per annum; to keepers of houses of refuge, only 400 dollars.

The law provides that the stations on the Atlantic and Gulf coasts shall be opened and manned for active service from the 1st day of September in each year until the 1st day of the succeeding May, and those on the lake coasts from the opening to the close of navigation—usually from about the 15th April to about the 15th December. On the Pacific coast the period is left discretionary with the General Superintendent. The time during which the stations are manned is designated the "active season." Four of the stations on the Pacific coast are kept open the year round, experience having shown that disasters in their neighbourhood occur more frequently from local causes than from stress of weather, and are about as liable to happen at one season as at another. For similar reasons a crew is kept continuously at the Louisville station.

The number of men composing the crew of a station is determined by the number of oars required to pull the largest boat belonging to it. There are some five-oared boats in the Atlantic stations, but at all of them there is at least one of six oars. Six men, therefore, make up the regular crews of these stations, but a seventh man is added on the 1st December, so that during the most rigorous portion of the season a man may be left ashore to assist in the launching and beaching of the boat, and to see that the station is properly prepared for the comfortable reception of his comrades and the rescued people they bring with them on their return from a wreck; also to aid in doing the extra work that severe weather necessitates. Where the self-righting and self-bailing boat which pulls eight oars is used, mostly at the lake stations, a corresponding number of men is employed.

The crews are selected by the keepers from able-bodied and experienced surfmen residing in the vicinity of the respective stations. This privilege is granted the keepers in view of the obvious necessity for mutual confidence between a leader and his followers in hazardous enterprises involving their own lives and the lives of others, and in view of the strict responsibility to which each keeper is held for the good repute of his station and the conduct of its affairs.

In the absence of strong counteracting inducements these considerations would naturally lead to the choice of the very best men to be had. It was early found, however, that political, social, and family influences were often strong enough to so control the selection as to materially affect the efficiency of a crew. To oppose them certain Regulations were established, the most important of which provided that the selection of keepers and crews should be made solely with reference to their fitness and without regard to their party affiliations. This, after being enforced for several years, received in 1882 the sanction of Congress, being at the same time extended to the appointment of District Superintendents and Inspectors. This enactment greatly aids successful resistance to the most insidious and potent evil that has ever threatened the welfare of the Service. Another important Regulation forbids a keeper to take into his crew his brother, father, or son, except where adherence to the rule would be detrimental to the Service. This was found necessary to countervail the quite natural inclination of keepers to provide situations for their near kinsmen, even to the serious detriment of the strength and *morale* of the station force.

Protected by these and a few less noteworthy safeguards, the method adopted for manning the stations has filled them with the very pick and flower of the hardy race of beachmen who inhabit our shores. No better evidence of the virtue of the plan can be desired than the fact that during the

eighteen years it has governed the selection of the men, not one has shown the white feather, while the pages of the annual Reports of the Service are crowded with the records of gallant deeds that have made them famous throughout the land.

Upon original entry into the Service a surfman must be not over 45 years of age, and sound in body, being subjected to a rigid physical examination by a surgeon of the Marine Hospital Service. He is afterwards examined as to expertness in the management of boats and matters of that character by the Inspector of the district. The Regulations setting forth his duties being read to him, he is enlisted by signing articles by which he agrees to reside at the station continuously during the "active season," to perform such duties as may be required of him by the Regulations and by his superior officers, and also to hold himself in readiness for service during the inactive season, if called upon. Desertion entails a forfeiture of his wages, to be exacted in the discretion of the General Superintendent. His compensation is 50 dollars per month during the "active season," and 3 dollars for each occasion of service at other times. Beyond the wages mentioned the surfmen receive no allowances or emoluments of any kind, except the quarters and fuel provided at the stations. Their food and clothing they themselves supply.

No person belonging to the Service is permitted to hold an interest in any wrecking apparatus, or to be connected with any wrecking company; nor is he entitled to salvage upon any property he may save or assist to save.

A surfman cannot be discharged from the Service without good and sufficient reason. For well-proven neglect of patrol duty, or for disobedience or insubordination at a wreck, the keeper may instantly dismiss him; in all other cases special authority must be first obtained from the General Superintendent.

In case a keeper or surfman becomes disabled by injury received or disease contracted in the line of duty, he is entitled to receive his full pay during the continuance of the disability, if it does not exceed one year, and upon the recommendation of the General Superintendent the Secretary of the Treasury may extend the time for a second year, or a part thereof, but no longer in any case. If any keeper or surfman loses his life by reason of injury or disease incurred in the line of his duty, his widow or children under 16 years of age may receive for two years the pay that the deceased would have if alive and in the Service. If the widow remarries or a child arrives at the age of 16, the amount that would have been paid to the one or the other goes to the remaining beneficiaries, if any. It will be seen at once that this beneficence affords certain advantages to the widow which the ordinary pension does not furnish, inasmuch as the death of her husband does not add to her grief the misfortune of financial embarrassment, by cutting off or diminishing the family income at a time when the funeral expenses make an unusual demand upon it.

At the opening of the "active season" the men assemble at their respective stations and establish themselves for a residence of eight months. They arrange for their housekeeping, usually by forming a mess, taking turns by weeks in catering and cooking, although at some of the stations they engage board of the keeper at a rate approved by the General Superintendent. These preliminaries being settled, the keeper organizes his crew by arranging and numbering them in their supposed order of merit, the most competent and trustworthy being designated as No. 1, the next No. 2, and so on. These numbers are changed by promotion as vacancies occur, or by such rearrangement from to time as proficiency in drill and performance of duty may dictate. Whenever the keeper is absent, No. 1 assumes command and exercises his functions.

The rank of his men being fixed, the keeper assigns to each his quarters and prepares station bills for the day watch, night patrol, boat and apparatus drill, care of the premises, &c. For the purpose of watch and patrol, the district officers establish patrol limits as far as practicable along the coast in both directions from the stations, marking them by distinct monuments, and a description of the beats thus laid out is sent to the office of the General Superintendent. The day watch is kept from sunrise to sunset by a surfman daily assigned to this duty, who is usually stationed in the look-out, and who, if the patrol limits cannot be seen from there, goes at least three times a-day far enough along the shore to bring them into view. During thick and stormy weather a complete patrol like that at night is maintained. At the harbour stations on the lakes, at the river station at Louisville, and at other places where accidents are frequent, there is connected with the look-out a gong, by means of which the crew is alarmed when occasion requires. The day watch keeps a record of all passing vessels.

For the night patrol the night is divided into four watches—one from sunset to 8 o'clock, one from 8 to 12, one from 12 to 4, and one from 4 to sunrise. Two surfmen are designated for each watch. When the hour for their patrol arrives they set out in opposite directions along the coast, keeping as near as practicable to the shore, as far as the ends of their respective beats. If within communicating distance from an adjacent station, each patrolman proceeds until he meets another from the next station and gives him a metallic check marked with his station and crew number, receiving in exchange a similar one. The checks thus collected are examined by the keeper, recorded in the journal, and returned to their proper stations the next night. If a patrolman fails to meet his fellow from the adjacent station, after waiting a reasonable time at the usual place of meeting, he continues his journey until he either meets him or reaches that station and ascertains the cause of the failure, which, on his return, he reports to his keeper, who makes a record of it in his journal.

At isolated stations each patrolman is required to carry a clock, within which is fixed a dial that can be marked only by means of a key which also registers the time of marking. This key is secured to a post at the end of his beat, and he is required to reach it and bring back the dial properly marked.

Each patrolman is equipped with a beach-lantern and several red Coston hand-lights. Upon the disovery of a wreck, a vessel in distress, or one running dangerously near the shore, he ignites by percussion his hand-light, which emits a brilliant red flame. This serves the double purpose of

warning the people on the vessel of their danger and of assuring them of succour if they are already in distress.

For every week-day a regular routine of duties is appointed. For Monday, it is drill and practice with the beach-apparatus and overhauling and examining the boats and all apparatus and gear; for Tuesday, practice with the boats; for Wednesday, practice with the International Code of Signals; for Thursday, practice with the beach-apparatus; for Friday, practice in the method adopted for restoring the apparently drowned; and for Saturday, cleaning house. Whenever anything prevents the regular performance of any of these duties, the fact must be entered upon the station journal, with a full explanation, and the omitted exercise performed at the first opportunity.

For practice with the beach-apparatus there is provided near each station a suitable drill-ground, prepared by erecting a spar, called a wreck-pole, to represent the mast of a stranded vessel 75 yards distant (over the water, if possible) from the place where the men operate, which represents the shore. At drill the crew is mustered in the boat-room, and each man, upon his number being called, salutes the commanding officer and recites, in proper sequence, every act he is to perform in the exercise as prescribed in the Service Manual. At the proper words of command they all fall into their allotted places at the drag-ropes of the apparatus-cart, and draw it to the drill-ground, where they perform the remainder of the exercise, which consists in effecting a mimic rescue by rigging the gear and taking a man ashore from the wreck-pole in the breeches-buoy. The officer conducting the drill carefully notes the time which elapses from the moment he gives the initial command "Action" until the rescued man sets foot upon the shore.

If in one month after the opening of the "active season" a crew cannot accomplish the rescue within five minutes, it is considered that they have been remiss in drilling, or that there are some stupid men among them. They are cautioned that if upon the next visit of the Inspector a marked improvement is not shown, some decisive action will be taken to secure it. This usually produces the desired effect. In many of the districts a spirited rivalry exists between the stations for excellence in this drill. It has been executed without error by several crews in two minutes and thirty seconds. I confess I was incredulous of the possibility of such a feat until I witnessed it myself; but even this is, perhaps, less surprising than the time attained at some of the night drills, when, without lights other than the moon and stars, the shot has been fired, the apparatus set up, and a man brought ashore from the wreck-pole in three minutes. Of course, nothing like such celerity can be expected in effecting rescues at actual shipwrecks, when storms, currents, surf, the motion of the vessel, the lack of skilful co-operation on the wreck, and many other unfavourable elements, conspire to obstruct progress, and the practice of timing the drill was instituted, not so much with the expectation of materially hastening the work of rescue, as with the design of giving the men the utmost familiarity with the stowage of the apparatus in the cart, with its uses, and with the method of handling it.

How well this purpose is fulfilled has been repeatedly illustrated on occasions of rescue, but never better than in the memorable storm of the 3rd February, 1880, which wrought general ruin and devastation upon the coast of New Jersey, and strewed her shores with wrecks. In the very height of that terrible tempest, at the dead of night, the crews of three separate stations rescued without mishap the people on four different vessels by means of the apparatus, set up and worked in almost utter darkness, the lanterns of the surfmen being so thickly coated with sleet that they emitted only glimmers of light so feeble that the lines and implements could not be seen. These and the other rescues achieved in that storm excited such public admiration that the State Legislature unanimously passed Resolutions commending the skill and bravery of the station crews.

Boat practice consists in launching and landing through the surf, and at least a half-hour's exercise in handling the oars under the keeper's directions.

Drill in signalling is conducted by interrogating each surfman as to the meaning of the various flags, the definitions of two-, three-, and four-flag hoists, the distinguishing flag or pennant of each hoist, the use of the Code Book, and by actual conversation carried on by means of two sets of miniature signals provided for each station. Frequent practice is also had between the stations and Revenue vessels.

The method adopted for restoring the apparently drowned is formulated into four Rules, which each member of the crew commits to memory. In drill he is required to repeat these and afterwards illustrate them by manipulations upon one of his comrades. The medicine-chest is also opened, and he is examined as to the use of its contents.

The proficiency of every keeper and surfman in the several branches of qualification in which he is thus trained, as ascertained in the drills conducted by the District Inspectors on their monthly visits, is marked by those officers in their drill-books upon a scale of ten; and transcripts of this rating are transmitted to the General Superintendent, who is thus kept constantly informed of the effectiveness of the corps.

The ultimate means employed by life-saving institutions to rescue people from stranded vessels are everywhere essentially the same. The tumultuous waters between the wreck and the shore are either crossed by a life-boat sent out to the imperilled people, or are spanned by strong lines, by which a breeches-buoy or other vehicle is passed back and forth. There are many kinds of life-boats, however, and various devices for effecting line-communication. The type of boat in most general use use in our Service, although properly entitled to be called a life-boat, is distinctively known as the surf-boat, and this term will be applied to it in the remarks which follow upon this topic. There are several varieties of this type, all developments of the boat found in use among the shore fishermen or surfmen of the Long Island and New Jersey coasts for crossing the surf on the outlying sand-bars in their daily blue-fishing when the first boat-houses or stations were placed there. Three varieties, respectively designated the Beebe, the Higgins and Gifford, and the Beebe-McLellan surf-boat, from the names of the persons who devised the modifications which characterize them, are the only ones furnished to the stations in recent years. They are all constructed of white cedar with white oak

frames, and their dimensions are from 25 to 27 feet in length, 6½ to 7 feet beam, 2 ft. 3. in. to 2 ft. 6 in. depth amidships, and 1 ft. 7½ in. to 2 ft. 1 in. sheer of gunwale. Their bottoms are flat, with little or no keel, and have a camber of 1½ or 2 inches in 8 feet each side of the midship section. They draw 6 or 7 inches of water, light, and weigh from 700 to 1,100 pounds. They are propelled with six oars, without sails, and are expected to carry, besides their crews, from ten to twelve persons, although as many as fifteen have been landed at a time in a bad sea. Their cost ranges from 210 to 275 dollars. There is no great difference between the Beebe and the Higgins and Gifford boat, except that the former has more sheer and is clinker-built, while the latter is of carvel construction. The Beebe-McLellan boat is the Beebe boat with the self-bailing quality incorporated. This feature has been added within the past two years, and but few of them have yet been put in service. All of these boats are so light as to be readily transported along the shore; they can be launched in very shallow water, and in the dexterous hands of our surfmen are manœuvred in the breakers with marvellous ease and celerity. This facility of handling is of great advantage when working in proximity to wrecks, enabling the boat to evade collision with floating wreckage and to quickly slip up alongside a stranded vessel at a favourable moment and receive its freight, while it is easily fended off from contact with the lurching hull.

These boats, of one variety or other, are supplied to nearly all the stations in the Service, and on the Atlantic seaboard they are relied upon almost exclusively. Indeed, the shores, of soft yielding sand, without roads, and the flat beaches, covered with but little depth of water for a considerable distance seaward, which almost uniformly mark the coast from Cape Cod to Cape Fear, preclude the use of boats of greater weight and draught. Even at those stations where the most approved self-righting and self-bailing boats are furnished, the surf-boats are generally preferred by the life-saving crews for short distances and when the number of imperilled people is not large. In executing the work required at minor casualties, such as aiding to float stranded craft by carrying out anchors, running lines to tugs, &c., they are especially handy, and by their use a vast amount of property has been saved.

As respects safety they will compare favourably with any other boats. During the eighteen years they have been in the hands of our crews they have been launched 6,730 times in actual service, and have landed 6,735 persons from wrecked vessels. In all this service they have capsized but 14 times. Six of these instances were attended with loss of life, the number of persons perishing being 41, of whom 27 belonged to the Service, and 14 were shipwrecked people.

Among other life-boats, the self-righting and self-bailing boats of the Royal National Life-Boat Institution of Great Britain, the honoured mother and mentor of all existing life-saving organizations, are unquestionably pre-eminent. They are the product of a century's devoted study and experiment with unstinted means, dating from the time the London coach-maker first conceived the idea of a life-boat. Their wonderful achievements have formed the theme of song and story, shed merited lustre upon the institution which fostered their development and stimulated the formation of kindred organizations, equipped with their models, throughout Christendom. I learn from the Annual Reports of the Institution that during the same period of eighteen years her boats have capsized 21 times, attended by loss of life, the number perishing aggregating 75, of whom 68 were life-boatmen and 7 shipwrecked people. The number of capsizes unattended with loss of life I could not ascertain, except by an exhaustive search through the detailed accounts of all the occasions of service, but I find by the official Report of the inquiry into the circumstances of the accidents to the Southport and St. Anne's life-boats in December 1886, made to the Board of Trade by Sir Digby Murray, Bart., and Captain the Hon. H. W. Chetwynd, of the Royal Navy, Chief Inspector of Life-Boats for the Institution, that during the previous thirty-two years the self-righting boats of the Institution had been launched in actual service 5,000 times, whereby 12,000 lives were saved, and that on these occasions 41 of the boats had capsized, 23 of the accidents being unattended with loss of life, while 18 were accompanied with fatal results. The number of persons lost was 88, 76 being life-boatmen, and 12 shipwrecked people. The Report further states that "the 76 life-boatmen lost represented about 1 in 850 of the men afloat in the life-boats on service, and the capsizes 1 out of each 120 launches on service." In the case of our capsized surf-boats, the 27 men lost represented 1 in 1,744 of the men afloat in the surf-boats on service, and the capsizes one out of each 480 launches on service. But as the saving of property is an incidental duty imposed upon our crews, the surf-boats, although they are not used in saving cargoes, are doubtless often lauched under conditions more favourable than generally fall to the lot of the boats of the Institution, and therefore the number of launches does not afford a satisfactory basis for comparison. Let us, therefore, take another basis. The number of lives saved by the life-boats is stated, as we have seen, at 12,000—in round numbers probably. Calling the number saved by the surf-boats 6,500 in round numbers, we find, then, 1 capsize of the surf-boat to every 464 persons saved, a difference in its favour of 172. The self-righting boat lost 1 life to every 136 saved, the surf-boat 1 to every 158 saved, a difference of 22 in its favour. Of the life-boatmen afloat, 1 to 850 were lost by the self-righting boat, 1 to 1,109 by the surf-boat, a difference of 259 in favour of the latter. In the life-boat 1 man of the crew is lost for every 157 lives saved, in the surf-boat 1 for every 240 saved, a difference in favour of the surf-boat of 83.

Since 1876 there have been put into the United States' Service 37 self-righting and self-bailing life-boats, of the model of a boat received from the Royal National Life-Boat Institution. They are all nearly reproductions of the boat sent to us. They are 29 ft. 3 in. in length, 7 ft. 7 in. beam, 3 ft. 1½ in. deep amidships, 1 ft. 10 in. sheer of gunwale, straight bottomed, pull eight oars, and weigh about 4,000 pounds each. This great weight is made necessary by the device of a heavy iron keel to aid in securing the self-righting quality. They have made on service 471 trips and saved 584 persons; they have capsized on service four times, once with fatal result, five lives, all shipwrecked people, being lost. These figures produce results similar to those already reached in reference to the life-boats in Great Britain. The boats have capsized once in each 118 trips, and once in rescuing every 146 persons, and one life has been lost from the boats to every 117 saved.

There are two other varieties of self-righting and self-bailing boats in the Service—the Richardson and the Dobbins. They are modifications of the life-boat just described, though considerably lighter. They have not been used often enough to furnish any practical basis of comparison, but have given good results so far.

Notwithstanding these figures, it would be unwise to hastily conclude that the surf-boat of either variety mentioned is the best life-boat for all conditions of service. Among the boats at present employed in life-saving institutions, I know of none that can justly be denominated the best life-boat. The type that is best for one locality may be ill-adapted or entirely unfitted for another, and a boat that would be serviceable at one time might be worse than useless at another in the same locality.

On the larger portion of the Atlantic sea-board boat-service at wrecks is not very distant from the shore, and the chief danger lurks in the line of surf which must be crossed, and in the breakers on outlying shoals. For this service the surf-boat is easily transported on its carriage through the loose and trackless sands of the strand to a point as near the wreck as possible, is quickly unloaded, and at a favourable time is launched in a minute. The keeper steers with a long steering oar, and with the aid of his trained surfmen, intent upon his every look and command, manœuvres his buoyant craft through the surf with masterly skill. He is usually able to avoid a direct encounter with the heaviest breakers, but if he is obliged to receive their onset meets them directly "head-on." His practised hand immediately perceives any excess of weight thrown against either bow, and instantly counteracts its force with his oar as instinctively and unerringly as the skilled musician presses the proper key of his instrument. He thus keeps his boat from broaching-to, and avoids a threatened capsize. The self-righting boat is more unwieldy, and not so quickly responsive to the coxswain's tactics, and is therefore not so well adapted to our general work.

The usual conditions of service in the United Kingdom are probably different. The excursions the life-boats make on service are said to be more extended, and exposure to violent gales for long periods upon the open sea more frequent. Our surf-boats, it is true, venture upon outlying shoals covered with breakers, such as the Nantucket Shoals, off Massachusetts, and the Diamond Shoals, off Cape Hatteras, but it is likely that there is no such locality within the scope of our Service so fatal as the terrible Goodwin Sands, which are often visited by the boats of the Royal National Life-Boat Institution, and where they have accomplished so much noble work. There are doubtless other important differences in the requirements of service with which I am not acquainted. Probably, therefore, the conditions are so diverse that no just conclusion as to the superiority of the two boats can be drawn from the results of their experience, and I have given these results in comparison not with a desire to establish such a conclusion, but to show that the United States' Service has provided quite as effective means for dealing with the conditions presented to it as the most eminent organization of other countries has for its conditions, and because I thought they might be of service in the deliberations of the Committee in considering some of the topics of the Division of the programme referred to it, and, further, because I thought they might aid in the efforts always being made by life-saving institutions and by individuals to improve the safety of life-saving boats. Where long excursions are to be undertaken, and the service is exceptionally hazardous, the men undoubtedly feel safer in a self-righting boat, and having this in view, it has been introduced into many of our stations, where it may be found side by side with the surf-boat, the choice being left to the keepers to take either, as the occasion seems in their experienced judgment to demand.

Self-righting and self-bailing are properties unquestionably desirable in any boat designed to be used in saving life, provided they can be obtained without too greatly impairing other necessary qualities. May it not be a question worthy of consideration whether these properties and the means of propulsion by sails cannot be advantageously incorporated into the surf-boat without materially increasing its weight and draught, and whether such a boat would not be found to be better adapted to perform the general services of life-boats than those which sit deeply in the water, and which, on that account, and because of their great weight, are less agile in action and more difficult to transport and launch? Already, as I have said, the self-bailing property has been successfully applied by Lieutenant McLellan, and is hailed with delight by our crews; the addition of sails has also been accomplished by the use of a centre-board, and I am able to add that I believe the self-righting quality is on the verge of successful application. One boat of this kind is already built, and with slight changes, which seem entirely practicable, I believe will satisfactorily solve the problem, at least so far as to answer all the purposes of our Service. When this result is attained, why may not self-bailing and self-righting boats supplant the inferior boats now carried upon passenger-vessels for life-boats? And why, since it has been found that the self-bailing principle can be applied to a model thoroughly convenient to be carried on shipboard, may not these vessels even now be supplied with self-bailing boats, in which the liability to capsize is greatly diminished by reason of their ability to immediately free themselves of any water they may ship?

For effecting line-communication with stranded vessels our Service chiefly employs the Lyle gun, named after Captain D. A. Lyle, of the Ordnance Department of the United States' Army, who devised it. It is to be found in every station except the houses of refuge. But the Hunt gun, devised by Mr. Edmund S. Hunt, of Massachusetts, and the Cunningham rocket, invented by Mr. Patrick Cunningham, of the same State, have been recently furnished to a few stations where the outlying bars are so far off shore that vessels may possibly strand beyond the range of the Lyle gun. This has been done not in the belief that the beach-apparatus can be effectually used at any distance beyond this range, but with the hope that a line, if thrown from the shore to a wreck, might be used to effect the passage of a boat or a life-car, or that some other means for rescue might be improvised. The Lyle gun is of bronze, with a smooth 2½-inch bore, weighs, with its carriage, 185 lbs., and carries a shot weighing 17 lbs. This projectile is a solid elongated cylinder 14½ inches in length, into the base of which is screwed an eye-bolt for receiving the shot-line, the bolt projecting sufficiently beyond the muzzle of the gun to protect the line from being burned off in firing. When the gun is fired the weight and

inertia of the line cause the projectile to reverse. The shot-lines used are of three sizes, designated by the numbers 4, 7, and 9, being respectively $\frac{4}{32}$, $\frac{7}{32}$, and $\frac{9}{32}$ of an inch in diameter. Any charge of powder can be used up to the maximum of 6 ounces. A range of 695 yards has been obtained with the No. 4 line under favourable circumstances. The range of the larger lines is, of course, proportionately diminished. The No. 4 is only used where the vessel is thought to lie beyond the range of the larger lines, for the reason that it is not strong enough to sustain the hauling of the whip-line on board —and an intermediate line has to be supplied, requiring the expenditure of time and strength—and because it is not so easily hauled upon by the shipwrecked sailors, as the larger one. The Hunt gun is also of bronze, of about the same size and weight as the Lyle, and not very different from it, except that it has a bore an inch larger, and is attached to its carriage-bed at the cascabel instead of resting on trunnions. Indeed, the peculiarity of the Hunt system is not in the gun, but in the projectile, which could be fired just as well from the Lyle gun if the latter were of sufficient calibre. This projectile consists of a cylindrical tube of tin, into one end of which is soldered a solid hemispherical piece of lead, which, when the projectile is placed in the gun, rests upon the cartridge, and upon discharge reverses its position like the Lyle shot and goes foremost. The shot-line being fastened into a staple in the centre of the inside surface of this piece of lead, is coiled in the tube until the cavity is nearly filled, being kept in place by a coating of paraffin, which is sufficiently adhesive for the purpose, but does not materially retard its paying out as the projectile flies. The tube has a capacity for 320 yards of No. 4 line. In the outer end is placed a diaphragm of pasteboard with a circular hole in its centre three-quarters of an inch in diameter through which a portion of the other end of the line hangs out. When the missile is placed in the gun, 4 or 5 inches protrudes beyond the muzzle. Upon this portion four trapeziform wings are soldered at regular intervals to control the flight. Before firing, the protruding end of the encased line is tied to another line coiled in a can, or otherwise so arranged as to permit it to be taken out without entanglement. When the discharge takes place the line in the can by its inertia and weight causes the line in the projectile to pay out, and, when the latter is exhausted, furnishes the supply for the remainder of the flight. The range obtained is about 40 yards greater than can be had with the Lyle projectile. The Massachusetts Humane Society uses this system altogether. The United States' Service prefers the Lyle system, because where extreme range is not required it conveys a larger and stronger line to the shipwrecked; because it does not require the use of an intermediate line for hauling on board the whip-line (Mr. Hunt claims that the line he uses is strong enough, but I should not dare to trust it); and because the projectile can be used any number of times, while the Hunt projectile after once being fired, either in drill or service, has to be returned to the manufacturer to be refilled, or a new one must be obtained, involving expense and trouble.

The Cunningham rocket system may be said to be an application of the Hunt projectile to a rocket. It consists of a powerful rocket, at the rear end of which is a female screw that receives the pointed end of a sheet-iron tube 5 ft. 9½ in. in length, and of equal diameter with the rocket. This tube is packed with 800 yards of No. 4 shot-line, which is connected with a shore-line in the same manner as in the Hunt system, and is paid out in flight as from the Hunt projectile. The tube also takes the place of the stick in other rockets. The shore-line can be of any size. The range of the rocket with a No. 4 shore-line is from 700 to 1,000 yards, which is diminished with other lines according to their sizes. With any line it exceeds that of any other rocket I have seen.

Several considerations have determined the choice of the gun for general use in the Life-Saving Service in preference to the rocket, among which are the following:—

1. Within its range it performs the desired service equally as well as any rocket at much less expense. The cost of the Lyle gun and all its appurtenances, exclusive of projectiles, is 87 dol. 83 c. The lowest cost of any efficient rocket with appurtenances that I know of is not much less. The only expense attending the use of the gun is the cost of the cartridge, say half a dime, except when occasionally a shot is lost, which can be replaced for 2 dollars. When a rocket is fired several dollars are expended. These facts are of consequence when considered in connection with the utility of frequent drilling.

2. The gun is very easily handled and readily prepared for firing. Everything can be done almost as well in the dark as in the light, and, if the weather be cold, without taking off the mittens. The manipulation of the rockets I have seen and experimented with is not so simple.

3. A rocket must be given considerable elevation in firing, whereby the line is carried high in the air—usually far above the stranded vessel—where it is exposed to the force of the wind, making it liable, in falling, to float wide of the mark and fail to drop across the vessel. The gun, on the other hand, can be given any elevation—even be depressed below a horizontal position if fired from a cliff—and the charge of powder can be graduated according to the distance the vessel lies from the shore, thereby greatly reducing the chance of failure.

A recent incident admirably illustrates the adaptability of the gun to exceptional situations. In the great storm of September last, the keeper of the Hunniwell's Beach station, on the coast of Maine, was notified that a wrecking crew of fifteen persons who were at work upon a vessel which had some time before struck upon Glover's Rock, some 5 miles distant from the station and out of sight, had hoisted a signal of distress. He put a heaving-stick, the Lyle gun, a shot-line, a whip-line, a breeches-buoy, and a spare line into the surf-boat, and with his crew set out for the rock. Arriving, he found the wreckers in danger of being engulfed by the growing sea, and that the boat could not approach near enough to enable him to reach the rock with the heaving-stick. He therefore anchored his boat, set the shot-line box on the stern, lashed the gun upon the after thwart, loaded it with a 1-ounce cartridge of powder, and fired, casting the line almost into the hands of the imperilled men. It was found impossible, however, to take them off with the breeches-buoy without great risk of their being dashed upon the projecting points of the rock. Fortunately, there was a small dory upon the rock, by means of which, with the use of the line, the whole number was drawn in six trips safely to the surf-

boat, which took them ashore through a sea which the keeper describes as as heavy as he ever saw. In the same storm the crew of the Lewes station, Delaware, fired the gun from the upper window of a fish-house, and landed the crew of a vessel into the loft with the breeches-buoy.

For a vehicle in which to transport people from a wreck to shore after line-communication has been established, the breeches-buoy is generally used, as in other countries. The life-car (which I believe to be the invention of Mr. Joseph Francis, of New Jersey, although this is disputed by Captain Douglas Ottinger, of the Revenue Marine Service, who claims to have devised it) is sometimes taken, however, especially where many persons are to be landed, and where the distance is too great to use the breeches-buoy. The car is a covered boat, made of corrugated galvanized iron, furnished with rings at each end, into which hauling-lines are bent, whereby the car is hauled back and forth on the water between the wreck and the shore without the use of any other apparatus. It is supplied, however, with bails, one near each end, by which it can be suspended from a hawser and passed along upon it like the breeches-buoy, if found necessary, as is sometimes the case where the shore is abrupt. The cover of the boat is convex, is provided with a hatch, which fastens either inside or outside, through which entrance and exit are effected. Near each end it is perforated with a group of small holes, like the holes in a grater, punched outward, to supply air for breathing, without admitting much, if any, water. It is capable of containing six or seven persons, and is very useful in landing sick people and valuables, as they are protected from getting wet. On the first occasion of its use it saved 201 persons.

In all other respects than those noted the beach-apparatus is the same as is used elsewhere.

A difficulty that has not infrequently seriously obstructed the operations of rescue, and which, I suppose, is familiar to all institutions which use the apparatus, is the inability of the ship's company to intelligently and promptly co-operate with the rescuing force. Improvidence has been imputed to sailors as a characteristic to an extent that is probably unjust. However that may be, it is certain that, as a rule, they do not in advance make the preparation for the emergencies of shipwreck that instinctive regard for their own safety would be expected to prompt. One would naturally suppose that every intelligent sailor—at least, every officer of a vessel—aware that there existed upon the coasts of nearly every country stations supplied with means of aiding their rescue if they should unhappily be cast ashore, would carefully acquaint himself with the methods employed. This is so far from being the case that tedious delays in the work of deliverance are frequently occasioned by their ignorance, which, in some instances in the history of our Service, have nearly proved fatal. The inscriptions printed in English and French upon the tally-boards or tablets, which are sent out with the whip-line and hawser, are explicit enough as to what is to be done after they are received, but they cannot always be read, sometimes on account of darkness, sometimes because no one on board is familiar with either the French or the English language.

Again, I have known instances in which sailors did not even know what to do with the shot-line sent them, and have with difficulty been made to understand that they were to haul it aboard. In dealing with this trouble we have followed the example of the Rocket Service of the Board of Trade in England, and published a pocket manual containing complete instructions for co-operating with the station crews, and showing by plain cuts the manner of setting up the parts of the apparatus sent on board. To this is added a list of the stations, with their locations, and other useful information relating to the Service. Each book is provided with a receptacle for cards, papers, &c., which makes the officers of vessels glad to get them and carry them in their pockets on account of the convenience they afford for the care of their small papers. Their value has been illustrated on several occasions of rescue, when the captains have stood, book in hand, and given directions from it as the operations progressed.

This device, however, has only partially remedied the evil. The distribution is not sufficiently general, in several nations not being made at all. I understand that in England and some other countries a knowledge of these matters is required as a qualification in officers of vessels. If the other maritime nations would also require this, the difficulties experienced would largely disappear. Emergencies arise, however, where, although the sailors well understand the part they have to take, progress would be greatly facilitated if there were some means of communicating between them and their co-operators on the shore, particularly at night. Such means would be advantageous not only on such occasions, but at other times, as when the shipwrecked, lured by the comparatively smooth appearance of the surf, as viewed from seaward, attempt to land in their own boats, while it can be plainly seen from the shore that the venture must be fatal. I think I can safely say that more lives are now lost within the scope of station operations through these attempts than from any other cause.

The telephone lines which now extend along nearly all those portions of the coast on which contiguous stations are located make it easy to quickly concentrate the crews of two or more stations at any point where additional force is required, as in the case when several wrecks occur at the same time in the same neighbourhood; and the double equipment at each station expedites this concentration by permitting the reinforcing crew to come unencumbered. A notable illustration of the benefit of such a combination of crews was the work achieved near Cape Henlopen in the great storm of the 10th, 11th, and 12th September last, one of the most destructive that has ever visited our coast, when the crews of three stations, under the leadership of Captain Clampitt, of the Lewes station, rescued the crews of 22 stranded vessels, 194 persons, by the use of every form of rescuing appliance: 23 being landed with the surf-boats, 16 with the self-righting life-boat, 135 with the breeches-buoy, and 20 with the life-car—not a life being lost.

The telegraph and railroad systems of the country are also used to secure the services of the crews at scenes of rescue far remote from their stations. On two occasions the Cleveland crew has been called to Cincinnati, Ohio, and Newport, Kentucky, a distance of 240 miles, to render aid to the sufferers from inundations in the Ohio Valley. On the first occasion 1,200 persons were succoured, on the second over 800. The crew of the Sturgeon Bay Ship Canal station, Lake Superior, was once called at

night to Chocolay Beach, near Marquette, Michigan, a distance of 110 miles. Proceeding by specia train running at the highest attainable speed, and taking with them their beach-apparatus and boat they reached the beach at midnight, and through a blinding snow-storm, and in spite of bitter cold, were able to board two stranded vessels and rescue 24 persons after every effort of the citizens had failed. Shorter journeys of from 15 to 30 miles by rail are frequently undertaken, especially where the railway skirts the shore, as it does on many parts of the coast.

At isolated stations, where aid from another station is not available, the keepers h ve authority to accept the assistance of volunteers, who are paid 3 dollars each per day upon the certificate of the of the keeper, approved by the District Superintendent.

After rescue the shipwrecked people are taken to the station and provided with every comfort it affords. They find hot coffee and dry clothing awaiting them, with cots for those who need rest and sleep. If any are sick or maimed, as is frequently the case, they are nursed and cared for until sufficiently recovered to safely leave; in the meantime, medical aid is called in if practicable. For wounds and ailments requiring only simple and well-known remedies, recourse is had to the medicine-chest, which is stocked with restoratives and medicines that can be safely used, and provided with a hand-book of directions. The sojourner also finds at hand a very fair library of books to relieve the tedium of his enforced detention.

The dry clothing is taken from a supply constantly kept on hand by the Women's National Relief Association, an organization established to afford relief to sufferers from disasters of every kind, and the libraries are the donations of the Seamen's Friend Society, and of sundry benevolent individuals. Several newspaper publishers send their papers regularly to many of the stations. The food is prepared by the keepers, or the station messes, who are reimbursed by the recipients if they have the means; if not, by the Government.

Occasionally unfortunate victims of shipwreck reach the shore to all appearances dead. In such cases the life-saving crews attempt their restoration according to the method for restoring the apparently drowned, in which they have been drilled as already described. When the Service was first organized we adopted the system then, and, I believe, still employed by nearly all life-saving organizations. It is known as the Hall Silvester method, containing features of each of the systems formulated by Dr. Marshall Hall and Dr. H. R. Silvester. A discussion of the subject in the "Life-Boat Journal" (February number, 1873), in which the "Direct Method," as it is called, recommended by Dr. Benjamin Howard, of New York, was brought to my attention, led to the adoption of the latter system with some slight modifications suggested by Dr. John M. Woodworth, late Surgeon-General of the United States' Marin Hospital Service. Dr. Frank Baker, Professor of Anatomy in the Medical Department of Georgetow n University, who is also connected with the Life-Saving Service, has, at my request, made a very tho rough examination of the various systems, and has submitted an exhaustive Report upon them. He states his general conclusion as follows:—

"The different methods all have in view the expulsion of the vitiated air in the lungs and the introduction of fresh. To effect this, respiratory movements are simulated. Hall does this by turning the patient on his face and compressing the thorax by pressure on the back, then turning him on the side and allowing the thorax to expand. The expulsion of air is but slight, but it is an excellent method of expelling fluids from the stomach and lungs. In Silvester's method the arms are first stretched at full length upward beside the head, then carried downward, pressing the elbows against the thorax. These motions are thought to alternately expand and contract the chest. It is difficult to understand how the first movement can produce an effective expansion, as the scapulæ are not fixed, and the muscles passing directly from the arms to the chest are inserted so high up on the thorax as to have but little, if any, effect. The second movement produces an expulsion of air, but not as effectively as in the method of Howard, by which the lower thorax and the abdomen are compressed, the diaphragm consequently pushed up and the lungs emptied. This method is believed to be more efficient than any other that has been employed. No active inspiratory movement is made, the expansive resiliency of the chest-wall springing back after compression being sufficient."

During the twelve years in which the "Direct Method" has been practised in the Service, 118 cases have come under the treatment of our crews. In this number of attempts at resuscitation 60 were successful and 58 unsuccessful. In some of the successful instances several hours elapsed after the patient was taken from the water before natural respiration was induced. Success has followed even after the patient had been pronounced dead beyond hope by reputable physicians. As to the results obtained by other methods I have been unable to secure any information.

Next to the success of the Service in saving life, that of its efforts in the saving of property is conspicuous. This is accomplished in getting vessels afloat when stranded, a work in which the surfmen are experts, in extricating them from dangerous situations, in pumping them out when leaking, in running lines between wrecked vessels and tugs when it cannot be done with ordinary boats, in rendering assistance in various ways, and in warning off vessels standing into danger. In the majority of casualties the surfmen succeed in saving the vessels and cargoes without any other aid than that of the ships' crews. When this is impossible they act in conjunction with the Revenue-cutters, which are equipped for rendering assistance in such cases if these vessels are available, or assist, if necessary, any other relief sent.

The tabular statistics published in the Annual Reports of the Service show, in reference to imperilled property, only the amount imperilled, the amount saved, and the amount lost within the field of station operations; but, in order to convey here a better idea of the value of the labours of the life-saving crews, I have had prepared a Statement of their salvage work during the years 1888 and 1889. This Statement shows that in 1888 the station crews saved, without any outside assistance, 194 vessels, valued, with their cargoes, at 1,495,550 dollars. The number of persons on board was 898. The number of vessels which they assisted other effort in saving was 88, the value involved being 2,170,500 dollars, and the number of persons on board 654. The aggregate number of vessels, there-

fore, which they saved, and assisted to save, was 282, the amount of property involved 3,666,050 dollars, and the number of persons on board 1,552. They also rendered assistance of less importance to 210 other vessels. In 1889 the crews saved, without outside assistance, 172 vessels, valued, with their cargoes, at 1,127,295 dollars. The number of persons on board was 823. The number of vessels which they assisted other effort in saving was 85, the value involved being 2,114,535 dollars, and the number of persons on board 623. The aggregate number of vessels, therefore, which they saved, and assisted to save, in this year was 257, the amount of property involved 3,241,830 dollars, and the number of persons on board 1,446. Assistance of minor importance was rendered to 253 other vessels. For all this, it must be remembered, they received no salvage.

But their usefulness as salvors of property does not end here. By the aid of the telephone lines, all of which are connected with telegraph stations, they give to the Maritime Exchanges and underwriters early notice of disasters, with information as to the condition of the vessels, the extent of additional aid required, if any, &c., or send directly to the nearest available place for tugs or other needed help, thus securing prompt assistance where delay would involve serious and perhaps fatal consequences. More valuable than this, perhaps, is the service rendered both to humanity and commerce in the prevention of disasters by the warning signals of the night and day patrol. Of course no estimate of the lives and property saved in this manner can be made. We only know the number of such warnings given. Last year they were 217. They have reached as high as 240 in a year, and during any of the last six years have not been less than 200.

It is pertinent to inquire what it costs to maintain this system, and whether the results produced are proportionate to the outlay. The expenditures vary considerably from year to year, as do also the aggregate results produced, the difference depending upon the number of new stations added to the establishment, and upon numerous contingencies. A summary of the expenditures and operations of any one year would therefore but imperfectly answer the inquiry. Such a statement, however, will be found interesting in other respects, and I give it in regard to the last fiscal year as extracted from the Annual Report, not yet printed: The total expenditures were 965,907 dol. 18 c., all but 163,454 dol. 3 c. of which was expended in the payment of the compensation of the officers and men and that of the clerical force—712,567 dol. 95 c. being paid to the keepers and surfmen alone. There were 378 disasters to documented vessels within the scope of the Service. There were on board these vessels 3,106 persons, of whom 38 were lost. The estimated value of property involved was 6,343,880 dollars. Of this amount, 4,995,130 dollars was saved and 1,348,750 dollars lost. The number of vessels totally lost was 63. In addition to the foregoing there were 150 casualties to smaller craft—sail-boats, row-boats, &c.—on which were 320 persons, of whom only 4 were lost. The property involved in these instances is estimated at 72,895 dollars, of which 59,310 dollars was saved and 13,585 dollars lost.

The results of all the disasters within the scope of the Service aggregate, therefore, as follows:—

Number of disasters	528
Value of property involved	$6,416,775
Value of property saved	$5,054,440
Value of property lost	$1,362,335
Number of persons involved	3,426
Number of persons lost	42
Number of vessels totally lost	63

To this statement should be added 787 shipwrecked persons succoured at the stations, the number of days' succour afforded being 1,732.

There were landed by the surf-boats 435 persons, by the self-righting life-boats 74, by the river life-skiffs (at Louisville) 56, by other station boats 179, by the breeches-buoy 193, by the life-car 10, by other means 40. There were besides 24 persons rescued who had fallen from wharves, piers, &t. The details relative to the saving of property, &c., have already been stated.

It may be mentioned that the loss of life from documented vessels last year was unusually large. The year before it was only 12. The average loss per annum since the introduction of the present system is 26.

The following is a general summary of the statistics of disasters that have occurred within the scope of the Service from the introduction of the present system in 1871 to the close of the last year:—

Number of disasters	4,924
Value of vessels	$55,473,190 00
Value of cargoes	$26,246,584 00
Value of property involved	$81,719,774 00
Value of property saved	$60,352,092 00
Value of property lost	$21,367,682 00
Number of persons involved	42,864
Number of lives lost	*505
Number of persons succoured	7,903
Number of days' succour afforded	20,837
Cost of maintaining the Service	$9,172,208 86

We would probably obtain a better idea of the relation between the cost of maintenance and the results by taking the aggregate during the seven years since the adoption of the present rate of wages, commencing July 1, 1883, and afterwards giving the average per station. In 1883 there were 194

* This includes 30 lost from undocumented vessels (small craft).

stations; 1884, 201; 1885, 203; 1886, 211; 1887, 218; 1888, 222; 1889, 225; making a total of 1,474 stations. The general cost and results may be summed up as follows:—

Cost during seven years	$5,791,184 05
Number of disasters	3,232
Value of property involved (vessels and cargoes)	$52,441,120 00
Value of property saved	$42,286,800 00
Value of property lost	$10,154,320 00
Number of persons on board	27,760
Number of persons lost	196
Number of shipwrecked persons succoured at the stations ...	4,831
Number of days' succour afforded	12,402
Number of disasters resulting in total loss of vessels	482

The average number of stations was 210, and the average annual cost of maintenance per station was therefore 3,928 dol. 89 c. Other average results per station per annum are as follows: —

Number of disasters...	2·19
Value of property involved	$35,577 42
Value of property saved	$28,688 47
Value of property lost	$6,888 95
Number of persons involved	18·97
Number of persons saved	18·84
Number of persons lost	·13
(Being 1 person to every 7 stations.)	
Number of persons succoured	3·27
Number of days' succour afforded	8·41
Number of disasters resulting in total loss of vessels	·33
(Being 1 to every 3 stations.)	

It is to be regretted that no data exist from which a definite comparison of the results of disasters to vessels upon the coasts, before and after the establishment of stations thereon, can be drawn. Unfortunately no provision of law was made for the collection of statistics pertaining to disasters beyond the scope of the Service until 1874, when authority was given to gather them. From the time, however, that the present life-saving system began its work upon the coasts of Long Island and New Jersey in 1871, all important data relating to casualties within its province have been secured. In 1849 and 1850, as I have before stated, the Government had erected upon these coasts boat-houses containing surf-boats and other life-saving appliances, each in charge of a keeper, for such effort as might be volunteered on occasions of shipwreck (a system somewhat similar to other existing volunteer systems), and although no definite record of the results of this experiment was kept, it is known that many lives were saved through the facilities it afforded. The number lost cannot be ascertained. I have positively learned, however, of the loss of 512 persons during the twenty years from 1850 to 1870, and have authentic information that these figures indicate but a fragment of the reality. Yet they afford the basis for some comparison. They give, for instance, an average annual loss of at least 25 lives. During the eighteen years of the existence of the present system the number lost upon this section of the coast has been 119, an annual average of only 7—a reduction of about 80 per cent.—which would doubtless be largely augmented if the facts could be ascertained, and this, notwithstanding the number of disasters has greatly increased as a consequence of the growth of the commerce of the country, particularly that of New York and Philadelphia.

It will be observed, too, that the ascertained loss of 512 lives during the twenty years of the volunteer system, although confined to a very small section of the coast, is greater than that upon all the dangerous coasts which have come under the protection of the present system during the last eighteen years. Yet this latter number (505) includes 30 lives lost from undocumented vessels (small craft), while the former does not embrace such. It also contains the lives of 28 wreckers lost from the steam-ship "Circassian" in 1876, on the Long Island coast, for whose rescue the breeches-buoy apparatus had been set up, but was deliberately and against the keeper's protest cast overboard by the wrecker in charge, for fear that his men would become frightened and avail themselves of it as the storm increased, while he hoped to float the vessel at high tide. If these be deducted, the number will be reduced to 447, and yield an average annual loss for the entire Service less than that upon the New Jersey and Long Island coasts alone under the volunteer system. I may here remark that in making up the annual record of the loss of life under the present system, care has always been taken to include every instance that could with any degree of fairness be said to have occurred within the field of the operations of the Service; the doubtful cases have been counted in, and among them are others than those specified above that could be deducted with equally good reason.

I have thus endeavoured to present a sketch of the organization and methods of the Life-Saving Service of this country, and to convey an accurate idea of its effectiveness. Doubtless the system appears to be an expensive and elaborate one, but it must be remembered that, putting aside entirely the consideration of the value of human life, which is beyond computation, it saves many times its cost in property alone, and that it fulfils the functions usually allotted to several different agencies. It rescues the shipwrecked by both the principal methods which human ingenuity has devised for that purpose, and which in some countries are practised separately by two distinct organizations; it furnishes them the subsequent succour which elsewhere would be afforded by Ship-wrecked Mariners' Societies and Marine Hospitals; it guards the lives of the persons in peril of drowning by falling into the water from piers and wharves in the harbours of populous cities, an office usually performed by Humane Societies; it nightly patrols the dangerous coasts for the early discovery of

wrecks and the hastening of relief, thus increasing the chances of rescue and shortening by hours intense physical suffering and the terrible agony of suspense; it places over peculiarly dangerous points upon the rivers and lakes a sentry prepared to send instant relief to those who incautiously or recklessly incur the hazard of capsizing in boats; it conducts to places of safety those imperilled in their homes by the torrents of flood, and conveys food to those imprisoned in their houses by inundation and threatened with famine; it annually saves, unaided, hundreds of stranded vessels with their cargoes from total or partial destruction, and assists in saving scores of others; it protects wrecked property, after landing, from the ravage of the elements and the rapine of plunderers; it extricates vessels unwarily caught in perilous positions; it averts numerous disasters by its flashing signals of warning to vessels standing into danger; it assists the Customs Service in collecting the revenues of the Government; it pickets the coast with a guard which prevents smuggling, and in time of war, surprise by hostile forces. I might considerably extend the catalogue of its beneficent offices. I could tell of the valuable aid it has rendered to scientific research; of its contributions of rare specimens to the Department of Marine Zoology in our National Museum; of the hotels, dwellings, mills, and other structures it has saved from destruction by fire; of its timely detection and prevention of burglaries and robberies, and of many other services inuring to the public benefit which it has incidentally rendered. But I must not detain the Committee longer. I have made a heavy draft upon its time and patience, which nothing but the importance of the subject would justify. The Conference sits in council charged with the responsibility of devising means to secure, if possible, a greater measure of safety to those who go down to the sea in ships. It is a responsibility of the gravest nature, in which we have an important share. We are to study the different methods of dealing with the contingencies of shipwreck; to compare the results of our individual experience and observations, and deduce for the consideration of the Conference such rules of action as seem to us practicable and best for common adoption. Of course, it is not apprehended that it is possible, or perhaps even desirable, that the diverse systems and methods pertaining to the various life-saving institutions of the world should be made uniform, but if the Conference could have the benefit of a full exposition of all of them, perhaps some of the best features of each system might be selected and recommended for general extension. Under these considerations and with this view I have felt that I ought not to omit, even at the risk of being tiresome, the mention of anything essential to afford a just conception of the general character and scope of our Service, which is so unlike all other organizations established for similar purposes.

Appendix (F).

Report of Committee on Life-Saving Systems and Devices.

Memoranda relating to Life-Saving Institutions on the Coasts of Europe.

THE following information and statistics have been collected with reference to institutions for the saving of life from shipwrecks in various European countries:—

Austria.

(Translation.)

* * * * * * *

There are in this Empire neither public nor private life-saving institutions, such as exist in the United States of America, because conditions on the east coast of the Adriatic do not render such institutions necessary.

In cases of wrecks or other disasters, the health officers of the port are bound to adopt the required measures to offer the first assistance to the endangered persons, and to secure, if possible, ship and cargo, to which end they use the boats, anchors, and ropes which are at their disposal.

Of these officers or harbour police, those stationed at Trieste, Lussinpiccolo, Zara, and Spalato are provided with steamers, and the one at Rovigno has a sail-boat, to offer effective assistance in the saving of life.

The harbour police at the remaining ports are empowered to hire private boats and help in case their means of rendering assistance are insufficient.

Aside from these there are life-saving boats, especially constructed for the purpose, stationed in four ports on the coast of Istria, where traffic is greatest, which serve at the same time as guard-ships to the Revenue officers, namely, at Umago and Cittanova, on the west coast of Istria, the life-boats Nos. III and V, built respectively in 1876 and 1878; at Rabaz, on the east coast of Istria, life-boat No. I, built in 1876; and at Faresina, on the Island of Cherso, life-boat No. II, built in 1883.

These boats are always kept in a state ready for use at a moment's notice, are perfectly seaworthy, and are adapted, when properly manned, to saving life at sea.

The above-named officers and men of the harbour police report by telegraph each disaster taking place in their respective districts to the Chief of the Marine Department, who, according to circumstances, adopts further measures for saving the vessel in distress.

There are no special publications issued or any reports made by the above-named officers. The Chief of the Marine Department simply collects the data as furnished by each station relative to name and tonnage of vessels, location, and cause of accident, damage, and loss of life sustained, and publishes these annually in the "Annuario Marittimo."

Nor is the life-saving service at sea on the coasts of the Hungarian Monarchy intrusted to a

special institution, but is performed by the harbour police, supplied for this purpose with the necessary crews, boats, and material.

The publications treating of life-saving appear in the Annual Reports of the Royal Hungarian Marine Department at Fiume, in the official weekly newspaper, and in the monthly series of the "Reports of the Royal Hungarian Ministry of Commerce."

(For the Minister of Foreign Affairs),
(Signed) M. PASETTI.

Vienna, November 13, 1888.

BELGIUM.

(Translation.)

Mr. Minister, *Ministry of Foreign Affairs, Brussels, September* 8, 1888.

* * * * * * *

I have the honour to inform you, Mr. Minister, that, contrary to what you appear to presume and to that which is practised in several other countries, notably in France and in England, the service of maritime assistance in the kingdom is not organized by philanthropic Societies. It is an institution of the State, placed under the control of the Minister of Railroads, Posts, and Telegraphs (Administration of the Marine), and of which all the expenses of the personnel and the material that it requires are at the charge of the Government.

I will add, Mr. Minister, that in that which concerns the Reports and publications referred to in your letter aforesaid, of the 11th August ultimo, the Administration of the Marine does not publish life-saving annals.

Pray accept, &c.
(For the Minister),
The Secretary-General,
(Signed) Baron LAMBERMONT.

Mr. Lambert Tree, &c.,
Brussels.

The Life-Saving Service, established since 1838, is a State institution.

The Government alone bears all the expenses for material, crews, and staff, necessitated by the organization and maintenance of the Service.

The life-saving stations are scattered along the whole coast for a distance of 65 kilom.

There are stations at Adinkerke, Nieuport, Ostende, Blankenberghe, and at Knocke. A new one is in course of erection at Coq, between Blankenberghe and Ostende.

At Nieuport and Blankenberghe there is a station on both sides of the harbour, as well as at Ostende, where there is a large life-boat, which is towed by one of the Government tugs in case a vessel should be in distress in the offing.

Each boat's crew consists of a coxswain, one or two assistants, and from seven to twelve rowers.

There is a life-boat at each of the stations provided with all the necessary apparatus and appliances for assisting crews and vessels in distress, always ready to be launched.

A wreck-gun and projectiles are placed at the disposition of the chief of the station for the purpose of establishing line-communication with the shore when the state of the sea prevents even insubmersible boats from approaching the wreck.

The boats and apparatus are stored in sheds, situated in places easiest of access to the beach. Each station has a supply of medicine and surgical appliances. The care of shipwrecked crews is superintended by the physician attached to the station.

DENMARK.

Direction of the Life-Saving Service of North Jutland.

Lemvig, September 20, 1889.

In herewith returning the inquiry of the Treasury Department at Washington in relation to various points connected with the Life-Saving Service on the Danish coasts, which inquiry was received together with the communication of the Ministry of the 17th instant, I would state as follows:—

The institutions in this country for the rescue of the shipwrecked are that of North Jutland, that of Bornholm, and that of Möen.

As regards the Life-Saving Service of North Jutland, I would refer to the list of stations and persons employed thereat, which appears in the Report of the last fiscal year.

The expense of the Life-Saving Service is defrayed by the State exclusively.

The number of life-saving stations will be found in the inclosed Notice to Navigators.

As regards the operations for the year up to the 31st March, 1889, within the scope of the life-saving stations of Jutland, I would state:

The number of cases of stranding was 73.

The value of the property saved and lost on these occasions is unknown to me, and no information can be given on this subject.

The number of persons shipwrecked on the occasions of the aforesaid 73 strandings was 742.

The number of persons rescued, 737.

Four shipwrecked persons perished on the coast when the vessel went to pieces, which it did

before assistance could be rendered, and during a collision with one of the light-ships on the coast, a seaman belonging to the crew of the colliding vessel was killed by a falling spar; thus five men in all perished.

As shipwrecked persons are not cared for, at Danish life-saving stations, for the reason that sufficient accommodations are afforded by the neighbouring inhabitants, the inquiries on this subject are not applicable to the state of things in this country.

The number of vessels totally lost during the aforesaid fiscal year was 40.

As regards the result obtained from the time of the establishment of our Life-Saving Service, computed from the 15th April, 1851, to 31st March, 1887, I will refer, as far as Jutland is concerned, to the following extracts from the Director's List of Strandings, and will answer the inquiries as follows:—

The whole number of vessels stranded during the above-named period was	2,208
The number stranded in 1887–88 was	62
The number stranded in 1888–89 was	73
Total	2,343

The value of those vessels, as already stated, is unknown.

According to the extract, the number of shipwrecked persons was	17,356
For 1887–88 add	411
For 1888–89 add	742
Total	18,509

According to this, up to March 31, 1887, the number of shipwrecked persons who were rescued was	16,381
In 1887–88 the number of persons rescued was	398
In 1888–89 the number of persons rescued was	737
Total	17,516

Up to March 31, 1887, the number of those lost was	975
In 1887–88 the number of those lost was	13
In 1888–89 the number of those lost was	5
Total	993

* * * * * *

From April 1857, up to March 31, 1887, the number of vessels totally lost was	1,550
In 1887–88 the number of vessels totally lost was	43
In 1888–89 the number of vessels totally lost was	40
Total	1,633

In addition to the shipwrecked persons previously mentioned, the crews on board of	18,509
180 "dead" vessels which were driven in up to March 31, 1889, were	1,046
Total	19,955

From the "dead" vessels driven upon the coast, the number of persons who perished in the open sea was	259
Before the stranding of not "dead" vessels took place, the number of those who perished at sea was	35
Total	294

Although the 294 persons last mentioned did not come under the information desired by the Treasury Department, I have, nevertheless, thought proper to furnish information concerning that portion of the "dead" vessels driven in, and concerning other persons who lost their lives at sea.

* * * * * * *

A number of the foregoing data have been taken from the Annual Reports of the operations of the Life-Saving Service, while others have taken from other sources.

The concise information desired by the Department at Washington, a portion of which is herewith communicated, is not found in the aforesaid Reports or in any other documents that are known to me.

Very respectfully,

(Signed) A. ANDERSEN.

To the Ministry of the Interior.

Extract from the List of Strandings at the Life-Saving Stations of Jutland.

(Prepared by Vice-Consul A. Andersen, Director of the Life-Saving Service of Jutland).

Introductory Remarks.

Before the Life-Saving Service was organized in Jutland, in the year 1852, means were adopted at certain points on the coast for the rescue of shipwrecked persons. Consequently, the list prepared includes shipwrecks on the west coast of Jutland for the period commencing 20th April, 1851. The enumeration is continued up to the 31st March, 1887, and includes portions of the Cattegat coast.

The first printed Report concerning the operations of the Life-Saving Service in this country appeared in the year 1858. As it was considered desirable, and even important on several accounts, that the list should embrace, as far as possible, all the losses that had occurred within the scope of the life-saving stations, even before the issue of the first Report, efforts were made to collect the necessary data on the subject.

This had special reference to the so-called "dead" vessels, *i.e.*, vessels driven ashore without any living persons on board, concerning the fate of whose crews the yearly Reports could, as a rule, contain no information from the nature of the case.

Concerning the crews of 126 out of 173 "dead" vessels embraced in the list, of which the number of men saved in the open sea was ...	735
And that of those who perished in the open sea was	*293
Total	1,028

some information was obtained only by way of exception.

The fact that it was found possible to obtain some of these data after the lapse of a comparatively long period of time is due, in a great measure, to the obliging disposition which the inquiries in question met with, almost without exception, among the local authorities on the coast, as well as among the Danish Consuls-General, Consuls, and Vice-Consuls in foreign countries, at the Record Office of Shipping, at the Bureau Veritas, at the editorial office of the "Berlingske Tidende," &c.

The aforesaid crews belonging to "dead" vessels, which, as already remarked, consisted of 1,028 men, are not taken into consideration in these observations, because the life-saving stations were unable to exert any influence over their fate.

The number of cases of stranding given in the list, from folio 1 to 111, is...		2,214
Of these no information could be obtained concerning	43	
And in	6	
cases the operation was repeated at the place of stranding, and is mentioned a like number of times in the list ...	—	49
The number of stranded vessels concerning which information was obtained was thus		2,165

To wit:—

		Rescued.	Lost.	Per Cent. Lost.	Number of Vessels stranded.
Under the Danish flag, in the list, folio	116–132	2,014	113	5·31	413

Rescued from vessels, nationality was not ascertained		15			
Lost through the stranding of such unknown vessels		..	40		
		16,381	975		2,165
The coast life-boats rescued from Danish fishing-vessels		123			
Total		16,504	975		2,165

If the last-named fishermen, rescued by life-boats, are not counted, the average percentage of persons who perished on the coast will be 5·62 of the number of persons shipwrecked.

* 31 men of this number, although they perished in the open sea, did not belong to "dead" vessels.

The fact that the percentage of those lost is so different for the different flags is to be attributed to various circumstances. The heavy loss of the English is principally due to their well-known disposition to attempt to land with their own boats. The low percentage of the Dutch is to be attributed to their flat-bottomed vessels, which were able to come nearer to land than others of the same size but with sharper bottoms, and the case was the same in respect to the Russians when the frigate "Alexander Newsky" was stranded with a numerous crew on board.

The number of vessels stranded which were known was	2,165
The number of those concerning which no information could be obtained was	43
Total	2,208
The number of these got afloat (including 9 "dead" vessels) was ...	658
While those totally lost were	1,550
Total	2,208

In addition to these strandings a number of vessels ran aground in the course of the year, but succeeded in getting afloat again by their own efforts, without having any connection with the land.

According to folio 111, the number of persons rescued by life-boats was	2,136	
And by fishermen	123	
		2,259
By the rocket apparatus	2,145	
And with rocket apparatus previously to 1851	12	
		2,157
With both combined		68
Total		4,484

Total	2,259	2,157	68	4,484

In operations of this kind, extending over a period of thirty-six years, there were, of course, some cases of disaster. Of these, we will mention the capsizing of four life-boats while attempting to rescue shipwrecked persons, on which occasions eleven boatmen and twelve of the persons who had been taken into the boats perished; also four capsizings, which caused the death of eight men, who were in boats, going through the life-saving drill.

The work done by the persons employed at the life-saving stations of Jutland (who, on the 31st March, 1887, were 39 overseers and 391 boatmen and assistants) may be divided as follows:—

Four overseers and 41 boatmen and assistants took part in the rescue of from 4 to 6 shipwrecked persons.

Four overseers and 48 boatmen and assistants took part in the rescue of from 11 to 20 shipwrecked persons.

Six overseers and 53 boatmen and assistants took part in the rescue of from 21 to 30 shipwrecked persons.

Seven overseers and 51 boatmen and assistants took part in the rescue of from 31 to 50 shipwrecked persons.

Three overseers and 59 boatmen and assistants took part in the rescue of from 51 to 70 shipwrecked persons.

Four overseers and 32 boatmen and assistants took part in the rescue of from 71 to 100 shipwrecked persons.

Four overseers and 26 boatmen and assistants took part in the rescue of from 101 to 200 shipwrecked persons.

Four overseers took part in the rescue of from 201 to 417 shipwrecked persons.

Twenty-two boatmen and assistants took part in the rescue of from 201 to 491 shipwrecked persons.

In connection with the foregoing concise statement of the nationality of the stranded vessels, the following details are given:—

France.

The services appear, for the most part, to be performed by the "Société Centrale de Sauvetage de Naufragés," founded in 1865. From the journal of that Society ("Annales du Sauvetage Maritime," tome xxiv, 1889) it is seen that the Society is supported mainly by voluntary contributions, having, however, a subsidy from the Government. The Society has 422 stations on the coasts of France and Algeria, employing 2,000 persons, most of whom are also employed in the Customs Service. Seventy-seven of the stations are provided with life-boats. From its foundation to the 1st October, 1889, the Society has saved by means of its boats and apparatus 4,561 persons and 286 vessels. It has besides assisted 175 vessels, and given rewards for saving of the lives of 823 persons.

Germany.

German Society for the Saving of the Shipwrecked.

Bureau of Management, Martini Strasse No. 41,
September 17, 1889.

* * * * * * *

The entire life-saving service on the German coasts is under the management of the German Society for the Rescue of the Shipwrecked. This Society is located at Bremen, and was founded on the 29th May, 1865.

The following statements will furnish information concerning the organization of the Society. It is under the patronage of His Majesty William II.

The presiding officers of the Society are:—

(*a.*) Consul W. H. Meyer, President.

(*b.*) Dr. Marcus, a Senator, who acts as President in the absence of M. Meyer.

(*c.*) Captain H. Steengrafe, a member of the Society; all of whom are residents of Bremen.

The officers of the Society are:—

(*a.*) Captain G. Pfeifer, Inspector.

(*b.*) Mr. Otto Kroll, Accountant; and the undersigned.

The Society is a private one, and is entirely supported by voluntary contributions.

The Society has 111 life-saving stations. Of these, 66 are on the Baltic, and 45 on the North Sea. Forty-two stations are double stations, provided with a boat and rocket apparatus; 51 are only boat stations, and 18 are only rocket stations.

* * * * * * *

(*a.*) The whole number of disasters to vessels on the German coasts in 1888-99, from the 1st April to the 31st March, was 43.

(*b.*) The whole number of persons that were on board of these 43 vessels was 281.

(*c.*) Of whom 254 were rescued.

Of these, 95 were saved by their own efforts; 67 were saved by other vessels; 46 were saved by private assistance from shore; and 46 were saved by the life-saving apparatus; 26 having been rescued by life-boats, and 20 by the rocket apparatus.

(*d.*) Twenty-seven persons perished.

From the foundation of the Society, the 29th May, 1865, up to the 1st April, 1889, 1,743 were rescued by life-saving stations. Of these, 1,452 were rescued by life-boats, and 291 were rescued by rocket apparatus.

The whole number of the vessels wrecked on the German coasts during this time was 1,892, with 10,208 persons on board. Of these, 9,404 were rescued, so that 804 persons perished.

We would here remark that the data given, *sub numeris* (5) and (6), have been taken solely from the statistics collected by our Society for its own use.

Fuller statistics of disasters to vessels on the German coasts are prepared and published by the Imperial German Statistical Bureau. (Statistics of the German Empire, published by the Imperial Statistical Bureau, new series, vol. xlii, part 1, for the year 1888; vol. xxxv, part 1, for the year 1887, and Comparative Tables, published at the same place, of "Disasters to Vessels on the German Coast in the years 1883-87," October number of the Monthly Statistical Reports of the German Empire, year 1888, also separately printed.)

* * * * * *

Very respectfully,
(Signed) DR. BOISSELIER, *Secretary-General.*

GREAT BRITAIN.

The life-boat service is mainly under the charge of the Royal National Life-boat Institution, founded in 1824. Their stations, now numbering 293, are managed by volunteer crews. An annual salary is paid to a coxswain and an assistant for each boat. The other boatmen are paid a fixed sum for each occasion of service and drill. The coxswain and assistant are also paid a like sum in addition to the regular salary. During 1888, 26 vessels and 626 lives were saved by them, and 174 rewards were given for saving lives by fishing and other boats. The total number of lives saved since the foundation amounts to 35,043, including lives saved each year by boats not belonging to the Institution, but which were rewarded by it for their services.

The rocket service is in the hands of the Board of Trade, and was organized under its present system in 1855. On the 30th June, 1888, there were 302 rocket stations, as well as 374 stations where belts and lines are provided for the rescue of those accidentally falling into the water. From July 1856 to June 1887 there were saved by the rocket apparatus 11,080 persons. The operations on wrecks are conducted by the coastguard, who also patrol the coast.

Other stations also exist under charge of various local corporations and private parties.

2. Nominal list of all those who constitute the Local Direction.
3. List of the stations with boats and rocket apparatus.

Het Bestuur der Noord- en Zuid-Hollandsche Redding-Maatschappij aan Treasury Department, Office of General Superintendent, United States' Life-Saving Service, Washington, D.C.

Agreeable to your writing of the 21st July last, we have the honour of furnishing the following information, and to inclose a copy of all printed documents published by us, with lists for more complete details.

1. Names and locations of all institutions having for their object the saving of life from shipwreck.

(1.) "Noord- en Zuid-Hollandsche Redding-Maatschappij," at Amsterdam.

(2.) "Zuid-Hollandsche Maatschappij tot Redding van Schipbreukelingen," at Rotterdam.

As to last-mentioned Company, we cannot give you any information. You should direct your request to that Company at Rotterdam.

2. The organization of each, including the names and functions of their officers.

The organization will appear from the inclosed documents, whereas the names and functions of our officers are noted on an inclosed list (first list).

3. How supported, whether by the Government, wholly, or in part, or by the contributions of private citizens entirely.

The Company is erected and maintained only by contributions of private persons, without any assistance from Government.

4. Number and location of each life-saving station, with the apparatus used at each; as life-boat, rocket, or other line-throwing apparatus.

See annexed list (second list).

To afford any specification about property cannot be done. Our Company, according to her Statutes, has in view exclusively the saving of persons.

We may answer your inquiries about last year as follows:—

1. Total number of disasters, 16.
6. Total number of persons saved, 46 with salvage means; 37 in other ways.
7. Total number of persons lost, 25.
8. Total number of shipwrecked persons succoured at stations 2 men at Scheveningen.
9. Total number of days' succour afforded, 16.

10. Number of vessels totally lost, 7 ships, amongst which one with the whole crew.

Since the whole period of the erection of the Company we can only state that since 1824 (year of the establishment) till last December, 1888, 3,193 persons were saved.

Hoping to have complied with your wishes as far as possible, we have, &c.

(The Direction of the North and South Holland Life-Saving Company),

(Signed) A. J. VAN VOLLENHOVEN, *Secretary.*

Amsterdam, September 30, 1889.

ITALY.

The principal life-saving institution is the "Società Italiana per provvedere al Soccorso dei Naufraghi," which has its head-quarters at Rome. The Society has under its control 10 stations, 8 of which are life-boat stations, 2 rocket stations.

There are besides a number of local Societies for giving aid to shipwrecked people or for resuscitating the apparently drowned. Such are the "Società Ligure de Salvamento," which has 16 huts of refuge; the "Società Livornese di Soccorso degli Asfittici," at Leghorn, and the "Società Veneziana di Soccorso degli Asfittici," at Venice.

RUSSIA.

Society established under the Supreme Patronage of Her Majesty the Empress, for Saving Life on Waters.

(Translation.)

(No. 783.) *St. Petersburgh, Ministry of Ways Buildings, Office of the Secretary, September* 9, 1889.

Sir,

In a communication addressed on the 3rd August last to the Secretary of this Society, M. N. O. Mikhnievich, you request certain information concerning the organization and functions of the Society.

In the absence of M. Mikhnievich, I have the honour to submit the following:—

1. The object of the Society is to give assistance to all persons in distress on the seas, lakes, and rivers within the boundaries of Russia.

2. The Society is composed of honorary members (by election); actual members, who contributed not less than 100 roubles in a single payment, or who contribute annually not less than 5 roubles, and co-operating members, who contribute not less than 1 dollar each year. The business of the Society is managed by a Principal Board, located at St. Petersburgh; forty-six District Boards, located in the principal cities of Russia, and a number of Local Boards established in various towns and villages. The organization and duties of these institutions are specified in sections 14 to 25 of the Constitution of the Society, a copy of which is inclosed herewith.

3. The Society is supported mainly by private contributions, but it also receives from the State

Treasury an annual subsidy of 25,000 roubles, in addition to various supplies not infrequently furnished to the life saving stations, without charge, from Government stores.

4. The Society has 2 cruizer stations, 10 rocket stations, 49 boat stations on seas, 41 boat stations on lakes and rivers, 73 winter stations, 72 sub-stations, 6 light-houses, 60 refuges, and 657 posts.

The location of each of these establishments, and a detailed statement of the boats and appliances possessed by each, will be found in the list, hereto annexed, of all the life-saving establishments of the Society up to the 1st January, 1889.

I am able to furnish statistical data only as to some of the particulars indicated in your letter, touching the operations of our live-saving establishments for the last year, viz.: The number of persons rescued during the year by the summer stations on seas was 159; by river and lake stations, summer, 48, winter, 76; by sub-stations, 20; by posts and refuges, 45; in all, 348 persons. The number of days of assistance afforded by sea stations proper was 25,038.

As regards the total number of diasters, persons imperilled, and lives and vessels lost, I have to state that the information received by the Principal Board is incomplete and fragmentary. As to the value of property involved, saved, and lost, no information reaches the board, inasmuch as the saving of property is not only outside of the proper duties of the life-saving establishments of the Society, but is expressly prohibited.

The total number of persons saved by the establishments of the Society during the period of its existence, up to the present year, was 6,378.

* * * * * *

Accept, &c.
(Signed) V. ROOTKOVSKI,
Assistant Secretary.

To the Superintendent of the
United States' Life-Saving Service.

(Translation.)

The organization of the crews of life-saving stations within the jurisdiction of the Society, and the system of compensation for the performance of the duties assigned to such crews, are subject to some variations according to local circumstances, and the degree of interest in the work of life-saving which may be awakened among the inhabitants of the various localities along the coasts and shores.

At all stations the keeper ("ataman") has full charge of the property, and full command over the crew, invariably recruited by himself. The keepers direct the use of the boats on all occasions, and take the helm or steering oar. As a general rule, the keepers, whether of boat stations or of rocket stations, call out the crews and direct all their movements at drills, inspections, firings of rockets, and life-saving operations.

Under the existing rules, the compensation of life-saving crews is determined by the District Boards. At present the keepers at most stations receive a salary at rates varying from 36 to 60 roubles per annum. Higher salaries are allowed to keepers of such stations only where the whole crews are salaried. In the Estland District, however, no fixed compensation is allowed either the keepers or the oarsmen, who do the work assigned them from an exalted sense of Christian duty. With very few exceptions, the stations in that district are well kept and work quite satisfactorily; still, even in that district two or three crews are found that perform their duties with indifference, if without protest—a fact which shows the impossibility of relying in all cases solely upon appeals based upon the exalted nature of the work of saving the life of fellow-men, and seems to prove the necessity of securing a definite pecuniary compensation, both to the keepers for their continuous labour and care, and to the oarsmen when on duty.

The most effective system of compensation is that adopted in the Liefland District. There the keepers are allowed from 36 roubles (winter stations) to 60 roubles (seaboard stations) per annum. For every drill or inspection, the oarsmen, the keeper, and the assistant keeper receive 2 roubles each, and for every rescuing expedition 5 roubles each, and in addition thereto a premium of 10 roubles, to be equally divided among them all, for every person saved. Since the first organization of this Society the stations of the Liefland District have always worked quite successfully, and have been kept in exemplary order.

In the Courland District a similar scheme of compensation has been adopted for boat stations, while at the rocket stations, the crews of which are fixed at four oarsmen and one keeper, a premium of 10 roubles, to be divided between them, is allowed for each working of the apparatus, whether on drill, inspection, or rescuing service. In cases of especially successful life-saving performances, the amount of the premium may be increased by the District Board, or a recommendation be made to the Central Board for special reward. In this district the stations are kept in good order, improving from year to year, and operate quite satisfactorily.

In most of the districts along the coasts of the White, Black, and Azov Seas, and also along the shores of the great lakes, the rates of compensation of the crews are not definitely settled, and even in those localities where compensation has been fixed the amounts allowed are wholly insufficient: thus, for drills each man is allowed from 30 to 50 copecks, and in no case more than 80 copecks, and for life-saving expeditions not more than 2 roubles, without any premium for lives saved. While the men at these stations not unfrequently display heroic zeal, they sometimes fall short of the mark.

At the Ansheron Station on the Caspian Sea (originally established by the Local Board of Baku, under the supervision of the Caucasus District Board, but at present wholly within the jurisdiction of the Baku District Board), a station situated in a locality destitute of population, where it was found necessary to build a house for the crew and to keep a horse for the hauling of fresh water, fire-wood,

and provisions, the keeper and his six oarsmen receive a salary all the year round; the keeper about 25 roubles, and the men about 15 roubles per month each. The keeping of this station costs to the Society about 2,500 roubles a-year. Its life-saving exploits often deserve high commendation.

The Poti Station, which also belonged until last year to the jurisdiction of the Caucasus District Board, was managed upon nearly the same plan as the Ansheron Station. The keeper and the oarsmen recived fixed monthly salaries all the year round. The cost was about 2,000 roubles a-year. No satisfactory account can be given of the workings of this station. In regard to its present organization under the management of the Kutais District Board, no Reports have as yet been received by the Central Board.

From the above data, and an examination of the Reports of the District and Local Boards, as well as from information furnished by the corps of Inspectors, the following general conclusions may safely be drawn: that the character of the men employed at the life-saving stations must be recognized as the principal factor in the problem of bringing such establishments into a state of due efficiency, and that fixed compensation in amounts corresponding with the labour and risk involved must be acknowledged as the best means of securing the right kind of men. It may be noticed, in this connection, that the risk incurred by the life-saving crews is, in a certain degree, lightened by the provisions of the existing regulations for mutual insurance. Unfortunately some of the District Boards fail to forward to the Central Board the requisite assessments or insurance premiums, and, as a consequence, the chief officers of the Service find it possible in only very few cases to call to the attention of the crews the existence of a right to insurance. This uncertainty cannot fail to detract in some measure from the efficiency of the Service.

(Signed) N. SOUSLOV, *Central B. Inspector.*

SPANISH SOCIETY FOR THE SAVING OF THE SHIPWRECKED.

Sir, *Madrid, October* 3, 1889.

I have received your letter dated the 2nd August, and I have the honour to send you the information that this Society can give in reference to maritime rescue in Spain. As the purpose of the Institution is only to save life, it does not collect statistics of the value of the cargoes of the vessels, either lost or saved, and though we have tried to obtain such data, we have been prevented by the fact that no statistics exists in the Ministry of the Navy, to whom the captains of vessels transmit the information of the disasters.

* * * * * *

I am, &c.
The President, Vice-Admiral,
(Signed) FRANCISCO DE PAULA PAVIA.

S. I. Kimball, Esq., General Superintendent,
Life-Saving Service, Washington.

The "Spanish Society for Saving the Shipwrecked," founded in 1880.

(Translation.)

1. In Spain the life-saving service is composed of the "Spanish Society for Saving the Shipwrecked," whose Superior Council and Central Board reside in Madrid, and the "Guipuzcoa Maritime Life-Saving Society," which has its Chief Bureau in San Sebastian. The latter Society was merged into the Spanish Society in December 1880.

2. The organization of the Society is described in detail in chapter second of the Statutes approved in general session July 12, 1885. The Superior Council is constituted as follows:—

Honorary Presidents: Hon. Ministers of the Navy, of Public Works, War, and the Treasury, and the Hon. Admiral of the Navy.

The Active President: His Excellency Señor Don Francisco de P. Pavia, Vice-Admiral and Senator.

Honorary Vice-Presidents: Matritense, President of the Economical Society, and his Excellency Señor Don Juan Romero y Moreno, Rear-Admiral.

Active Vice-Presidents: His Excellency Señor Don Eduardo Saavedra, Engineer and Academician; his Excellency Señor Don Hilario de Nava, Inspector-General of Naval Engineering and Deputy to the Cortes; his Excellency Señor Don Francisco Coello, Colonel of Engineers and Academician; his Excellency the Duke of Victoria, Senator and Director of Railroads in the South.

* * * * * *

The duties recommended to the Central and to the Local Boards are defined in the respective Regulations.

3. The Society is founded on national charity, and being declared by law, on the 12th January, 1887, to be of public utility, the Government granted it a subsidy of 8,000 dollars for the maintenance and preservation of the material which by the said Law was given into its charge. On October 1888, on account of economy in all public expenses, the subsidy was reduced to 7,200 dollars per annum.

4. The Society has the following stations:—

Supplied with life-boats and apparatus for throwing ropes: Guipuzcoa, two boats and four apparatus for throwing ropes; Portugalete, one boat and one apparatus for throwing ropes; Barcelona, idem, idem; Cadiz, idem, idem; Vinaros, life-boat, —, and apparatus for throwing ropes; Torrevieja, boat and apparatus for throwing ropes; Algeciras, idem, idem; Laredo, life-boat and apparatus for throwing ropes; San Lúcar de Barranceda, boat and apparatus for throwing ropes; Arecibo, idem, idem; San

Juan de Puerto Rico, idem, idem; Palamós, idem, idem; Tarragona, boat, life-boat, and apparatus for throwing ropes; Denia, boat and apparatus for throwing ropes; Gijón, idem, idem; that is to say, a total of fifteen stations with boats and rope-throwing apparatus.

Supplied with one boat: Station at Cape Palos; station at Correpedo, Rosas, Villannera, and Settin, Puerto de la Selva, Cadaqués Ybiro-Ria del Barquero, Candás, one life-boat. Serilla, idem. Pending an application, two boats. Total, 12.

Supplied only with apparatus for throwing ropes: Santander, two apparatus; Rivadeo, one; Blanes, one; Tarifa, one; Cartagena, one; Rivadesella, one; Palma de Mallorca, two; Alardia, one; Felanitz, one; Sollar, one, Torredembarra, one; Cambrils, one; Ceuta, one; San Felix de Guixols, one; Coruña, two; Corcubión, one; Garrucha, one; Llanes, one; La Escala, one. Total 22.

There are, besides, an unlimited number of guns, large Torres life-buoys, ropes, cables, Legrand hooks and life-preservers, at the stations of Ferrol, Huelva, Puerto de Santa Maria, Santurce, Toledo, Viga, and at the light-houses of Estaca de Vares, Islands of Lisaigas, Finisterre, Alboran, Columbretes, and Buda Island.

Statement of Services rendered by the Stations during the year 1888.

The subject of questions 1 and 5 of this part of the interrogatory do not relate to the Society, whose only object is to save lives, and the data comprehended by them do not exist at the Ministry of the Navy, which keeps no record of them.

Number of persons saved by the Society directly, 187.
Saved by the apparatus of the Society, 173.
Number of persons who perished of those rescued by the Society, 0.
Number who perished of those not rescued by the Society, 28.
Number of shipwrecked rescued at the stations, 187.
Number of days they were succoured, 11.
Number of vessels totally lost not known, but about 70 per cent. usually.

Services rendered by the Stations since the Creation of the Society.

Number of persons directly saved by the Society, 571.
Saved without the apparatus of the Society, 841.
Number of persons who perished of those aided by the Society, 0.
Number who perished not rescued by the Society, 148.
Number of wrecked persons aided at the stations, 571.
Number of days in which aid was given, 57.
And 25 nights in which shipwrecks took place.

The President, Rear-Admiral,
(Signed) FRANCISCO DE PAULA PAVIA.

Madrid, October 5, 1889.

UNITED STATES.

Besides the Service maintained by the Government, an account of which will be found in Appendix (E), there is the Massachusetts Humane Society, supported by voluntary contributions. This Society was founded in 1786, and has 78 stations on the coast and rivers of Massachusetts, besides some 20 stations at which minor apparatus, such as life-buoys, bladders, and lines, are kept. During the last year they saved 123 lives and assisted 5 vessels, besides giving 111 rewards and 26 certificates for brave service.

INTERNATIONAL MARINE CONFERENCE.

Report of the Committee upon the Subject of a Uniform Load-Mark.

(General Division III of the Programme.)

Members of the Committee:

Brazil..	Captain LUIZ DE SALDANHA.
Chile	Lieutenant BEAUGENCY.
China..	Lieutenant CHIA NI HSI.
France	Captain RICHARD.
Germany	Dr. SIEVEKING.
Great Britain	Mr. GRAY.
Italy	Captain SETTEMBRINI.
The Netherlands	Captain HUBERT.
United States	Mr. GRISCOM.

Sir, *Washington, D.C., November* 26, 1889.

YOUR Committee, having been appointed to report on the subject of a uniform load-mark, have first of all endeavoured to obtain as much information as could be collected on this very important question.

The British law, as laid down in "The Merchant Shipping Act, 1876" (39 & 40 Vict., cap. 80), gives certain powers to the Board of Trade to detain British and foreign vessels which, by reason of overloading or improper loading, are unfit to proceed to sea without serious danger to human life. These powers may be put into force against foreign ships when they have taken on board all or any part of their cargo at a port in the United Kingdom, and are, whilst at that port, unsafe by reason of overloading or improper loading.

With the intention of carrying out this law in a way consistent with the interests of the mercantile community on the one side, and with the regard due to protection of life and property on the other side, certain general Rules, after careful investigations instituted by a Load-line Committee appointed by the President of the Board of Trade, as well as by the Board of Trade, have been framed with the purpose of ascertaining whether a ship be overloaded or not. These Rules assign to ships a freeboard which, according to the experience collected on the subject, is considered sufficient to prevent dangerous overloading without unduly interfering with trade, and they contain Tables assigning such freeboard as is suitable for vessels of the highest class in Lloyd's Register or of strength equivalent thereto, and which is to be increased for ships of inferior strength.

The above-mentioned Rules have proved to be a good standard upon which to determine the proper loading of British vessels which are classed in Lloyd's Register, or for other vessels the particulars of whose strength and fitness to carry any particular cargo can easily be ascertained by the Surveyors of the Board of Trade.

As regards foreign ships, however, which are loading in the United Kingdom, and which are either not classed in Lloyd's Register, or the particulars of which cannot be ascertained without a minute examination, the difficulty exists that the law which intends to guard against the dangers arising from overloading cannot be enforced without serious disadvantages to the owners of ships and cargoes consequent upon the difficulty of ascertaining whether the ships are fit to carry the cargo in question.

For these reasons it appears to be obvious that it would be very desirable if means could be found to ascertain, in a simple and easy way and without loss of time, the fitness of any vessel loading in a port of the United Kingdom to load a particular cargo.

These remarks naturally apply also to vessels loading elsewhere, because it is a very high and important interest, common to all nations, to take every possible measure for the protection of life and property against the dangers arising from overloading.

For these reasons it appears to deserve very serious attention whether, by providing for a certain load-line to be marked on sea-going ships, a trustworthy and simple method could be arrived at for deciding whether a loading vessel should be detained for overloading or ought to be allowed to go to sea.

The British Government has recently invited the attention of other Governments to

this question. But inasmuch as up to the present no progress has been made in this matter, the question arises whether something could be done to expedite an understanding by any action on the part of the Conference now here assembled.

Now, as far as your Committee have been able to ascertain, the laws of many maritime nations contain provisos for dealing with the question of overloading, and enabling the local authorities to detain overladen ships. But nowhere, except in Great Britain, as far as is known, have statutory Rules been introduced for the purpose of ascertaining whether a ship be fit to carry a certain cargo by a load-mark or load-line.

In order to arrive at such laws and to enforce them it would appear to be necessary to induce the Governments of the maritime nations not only to institute investigations similar to those made in Great Britain above referred to, but also to establish a sufficient staff of competent officials to insure the universal compliance with the laws to be given, and to establish Courts of Appeal authorized to decide on complaints against unjust detention and to award damages to the ship-owners and shippers of cargo in case of an unjustifiable detention.

It appears to your Committee that this would be surrounded with very serious difficulties, as it depends upon the varying conditions of each country whether the Governments would think it advisable to take steps in this direction or not. It must be kept in mind that a great display of scientific labour, and moreover a heavy expenditure of money, would be necessary to introduce a system similar to that which is used in Great Britain. Besides, it could be questioned whether it be necessary to make a law on load-lines or load-marks in order to guard against the danger of overloading, because it might be said that sufficient safeguards are given by the responsibility of the ship-owners towards the shippers of the cargo, and to their insurers, and by the control exercised by the underwriters and the various institutions for classing ships. There may also be circumstances peculiar to certain countries, as, for example, the fact that the goods which they export, generally, are light goods only, which do not endanger the stability of a ship, which may operate in favour of non-interference on behalf of the respective Governments.

Your Committee is led to believe that on these grounds, notwithstanding the advantages which would be connected with the introduction of a uniform system of load-marks, this matter is not ripe for consideration by this Conference, and that it ought to be left to the negotiations to be carried on between the Governments of the maritime nations.

We beg to remark, in concluding, that this Report has been sanctioned by the undersigned members of your Committee unanimously, and that Mr. Thomas Gray, who has been prevented from reading and signing it by the necessity of his departure, has, nevertheless, expressed his concurrence with its general views. The Delegate from Brazil has been prevented from attending the Committee by the political events which have led to his withdrawal from the Conference.

Inclosure 12 in No. 143.

INTERNATIONAL MARINE CONFERENCE.

Report of the Committee upon General Divisions II, IV, and VI of the Programme.

Members of Committee:

Brazil	.. ..	Captain L. SALDANHA DA GAMA.
China	.. ..	Commander CHEN NGEN TAO.
Costa Rica	.. ..	Don MANUEL ARAGON.
France	.. ..	Captain LANNÉLUC.
Germany	.. ..	Captain DONNER.
Great Britain	.. ..	Mr. WIMSHURST.
Italy	.. ..	Captain SETTEMBRINI.
Norway	.. ..	Captain SALVESEN.
United States	.. ..	Captain SAMPSON.

Sir, *Washington, D.C., December* 5, 1889.

THE Committee appointed to examine and report upon the subjects contained in General Divisions II, IV, and VI of the programme proposed by the United States Delegates, beg to submit the following Report:—

GENERAL DIVISION II.

Regulations to determine the Seaworthiness of Vessels.

(*a.*) Construction of vessels.
(*b.*) Equipment of vessels.
(*c.*) Discipline of crew.
(*d.*) Sufficiency of crew.
(*e.*) Inspection of vessels.
(*f.*) Uniform certificates of inspection.

1. It is the opinion of the Committee that, upon the subjects contained in the sections of this Division, no International Rule could be made which would secure beneficial results. It is thought that the Conference would be limited in each case to a recommendation fixing a minimum for the objects which it is desired to secure under each of these sections. If such a minimum were made the legal requirement, it would have an injurious effect upon the present standard of efficiency in many countries.

2. In other countries where such efficiency does not exist, it is thought that it will be best secured by the same means which have secured it elsewhere, leaving each nation to modify such means in ways which will best adapt them to the particular methods of the respective Governments.

3. Again, it is found that the present Rules existing in different countries upon several of these questions are different in many respects, though probably equally efficient. It would, therefore, become necessary, in forming an International Rule in such cases, to recommend changes in the existing Rules of several countries which to some of them might be unpractical. This is thought to be undesirable. However, the Committee earnestly recommend that—

4. All vessels, whether propelled by steam or sail, should possess a margin of strength over and above that which is required to enable them to perform the work for which they were designed and built. A chain, a bridge, or any other structure, the failure of which would entail the loss of human life, invariably has a considerable reserve of strength provided—in other words, the admitted working load is always much less than the computed strength, or the strength ascertained by actual test; certainly it is no less important that the hull of a vessel should contain a similar reserve.

5. To attempt to formulate rules for the construction of vessels of all sizes and for all trades would far exceed the province of this Committee, and besides, any arbitrary rules would probably much hamper the advance in design and the method of construction.

6. Therefore, to obtain as much as seems to be practicable in this direction, it is

desirable to rely upon efficient and oft-repeated inspection, when upon the least indication of distress, or of rupture showing, very substantial additions should be made before the vessel is allowed to again proceed to sea.

7. Ocean-going steam-vessels which carry passengers should be additionally protected by having efficient bulkheads, so spaced that when any two compartments be filled with water, the vessel will still remain in a seaworthy condition, and two at least of the amidships bulkheads should be tested by water-pressure to the height of the deck next above the water-line.

General Division IV.

Uniform Regulations regarding the Designating and Marking of Vessels.

(*a.*) Position of name on vessels.
(*b.*) Position of name of port of registry on vessels.
(*c.*) Size of lettering.
(*d.*) Uniform system of draught marks.

1. The name of every registered merchant-vessel shall be marked upon each bow and upon the stern, and the port of registry of every such vessel shall be marked upon the stern.

These names shall be marked in Roman letters in a light colour on a dark ground, or in a dark colour on a light ground, and to be distinctly visible.

The smallest letters used shall not be less than 4 inches high.

2. The draught of every registered vessel shall be marked upon the stem and stern-post in English feet or decimetres, in either Arabic or Roman numerals. The bottom of each numeral shall indicate the draught to that line.

General Division VI.

Necessary Qualifications for Officers and Seamen, including Tests for Sight and Colour-Blindness.

(*a.*) A uniform system of examination for the different grades.
(*b.*) Uniform tests for visual power and colour-blindness.
(*c.*) General knowledge of methods employed at life-saving stations.
(*d.*) Uniform certificates of qualification.

1. Every man or boy going to sea as a seaman, or with the intention of becoming a seaman, should be examined for visual power and colour-blindness; and no man or boy should be permitted to serve on board any vessel in the capacity of seaman, or where he will have to stand look-out, whose visual power is below one-half normal or who is red or green colour-blind.

2. Every man who shall qualify as an officer of a registered vessel after the adoption of these Rules, except engineer officers, shall be required to have a certificate that he has the necessary visual power, and that he is not red and green blind. He shall also have a certificate that he is familiar with the Regulations for Preventing Collisions at Sea, and with the duties required of him in co-operating with a life-saving station in case his vessel is stranded.

It is recommended that each country provide means which will enable any boy or man intending to go to sea to have his eyes examined for visual power and colour-blindness, and to obtain a certificate of the result, also to enable the master of any vessel to have the eyes of any of his crew tested for the same purpose.

It is the opinion of the Committee that defective visual power and colour-blindness are sources of danger at sea. The first both by day and night, because of the inability of the short-sighted to see objects at a sufficient distance. Colour-blindness is a source of danger, more especially at night, because of the inability of a colour-blind person to distinguish between the red and green side-lights. The inability on the part of an officer or look-out to distinguish the colour of buoys may be a cause of accident in broad daylight.

It is the opinion of the Committee, however, that tests for these defects need not be enforced in the cases of masters and mates who already occupy such positions.

The Committee purposely avoids making any recommendation as to the methods to be used in making such tests for visual power and colour-blindness, or in conducting

the necessary examinations for officers. It is thought that the desired objects will be best secured by leaving each country to employ the methods which may seem most suitable.

Inclosure 13 in No. 143.

Report of Committee No. 2 on Lanes for Steamers on Frequented Routes.

(General Division VII.)

Members of the Committee:

Denmark	M. GARDE.
France	Captain LANNÉLUC.
Germany	Captain DONNER.
Great Britain	Admiral BOWDEN-SMITH.
Hawaii	Mr. H. A. P. CARTER.
Portugal	M. SOUZA ROZA.
Sweden	Captain MALMBERG.
The Netherlands	Captain HUBERT.
United States	Captain SHACKFORD.

Sir, *Washington, December* 6, 1889.

COMMITTEE No. 2 beg leave to report on General Divison VII, entitled, "Lanes for Steamers on Frequented Routes," that after consideration of various routes they concluded to report only upon the North Atlantic route between ports of North America and ports of Northern Europe as the route upon which there was apparently the greater demand for such lanes, if such could be advantageously laid down on any ocean or sea.

It appears that the adherence of fast steam passenger-vessels to certain southerly routes would tend to the avoidance of fog and ice, and the Committee adopted a Resolution to the effect that it was desirable during the spring and summer months that such vessels should follow a southern route which would clear the Banks of Newfoundland, and be likely to be clear of fog and ice, but when it came to proposing any plan to make such ocean lanes compulsory, the Committee found the subject one of such difficulty that they do not recommend a proposition of that nature.

The difficulty of enforcing the present rule providing for moderate speed in thick weather suggests what greater dificulties would be met with in enforcing lane routes if made compulsory, and it was not thought desirable to lay down routes by international agreement unless they were to be made compulsory by swift steamers.

Routes that might be proposed would be in danger of invasion by ice during the spring and summer months, and at all times would be crossed by sailing-vessels and steamers going north and south. If laid down on parallels of latitude which seemed to favour one seaport at the expense of another, or the ports of one country at the expense of the ports of another country, they would arouse opposition that would probably prevent their adoption.

It is possible that even in the near future vessels may be employed of such power and speed that all such considerations may have to give way to the paramount consideration of safety, but, so far as shown to the Committee, present conditions do not seem to justify an international agreement to that effect. It was not shown to the Committee that collisions

in mid-ocean between fast ocean steamers had taken place or that the danger was great enough to justify enforced adherence to certain lanes. Collisions between fast steam-ships, so far, have occurred nearer the coasts where all tracks must converge.

The Committee believe, however, that the voluntary establishment of, and adherence to, particular routes by the different Steam-ship Companies, for different seasons of the year, is very desirable. In fact, the Committee are of opinion that such action by the Steam-ship Companies, with the experience to be gained thereby, would be quite essential before any concerted action by the Maritime Powers could be profitably taken.

The Committee therefore strongly recommend that the Companies interested should, by mutual agreement, after consultation together, establish routes for the different lines, and make them public, in order that the Hydrographic Offices of the various Governments may publish them for the information of navigators.

The Committee have considered the opinions of several persons in the printed matter that has been laid before them. With the exception of one or two definite propositions, the literature before the Conference does not show how such lane routes could be laid down. Even those containing such propositions arrive at the conclusion that such routes could not be made compulsory. In Appendix (A) will be found extracts or copies of the papers laid before them.

Sub-section (*b*).: With regard to the safety of fisherman upon the North Atlantic Ocean, the Committee are of opinion that their safety would be best promoted by unceasing vigilance on the part of the fishermen, and by careful compliance by all with the present Rules for the Prevention of Collisions, especially as to the efficiency of lights and sound-signals. If lanes were established which carried the fast steamers clear of the Banks frequented by the fishermen it might promote such a sense of security on their part as would tend to carelessness with reference to the rules as at present laid down, and lead to danger from the slower vessels which would still frequent the Banks.

During the months when the fishing-vessels most frequent the Banks, the fear of encountering fog and ice leads many of the steamers to go south of them.

Quick passages are what the steam-vessels aim at in response to the public demand for swift passenger and mail service, and if they were compelled to obey existing Rules regarding moderate speed in fogs at all times and in all places they would avoid the Banks still more in order to go clear of fogs; and thus it seems that the solution of the problem before the Committee, namely, of how to induce steam-ships of great speed to take safer routes to avoid fogs, ice, and danger of collision with fishermen and other vessels, is in compelling obedience to the present Rules regarding moderate speed in thick weather. The enforcement of these Rules would make it for the interest of such vessels to take routes comparatively clear of fogs and ice, and thus attain the end which compulsory legislation might fail to do.

In Appendix (B) will be found some correspondence regarding the dangers of fishermen upon the Banks, from which it will be observed that vigilance regarding lights and sound-signals have been found efficient safeguards in most instances.

Appendix (A)

Report of Committee No. 2 on Lanes for Steamers on Frequented Routes.

(General Division VII.)

Extract from Letter written by C. A. Griscom, President of International Navigation Company, November 21, 1889.

THERE can be no doubt that the risk of collision is the principal danger to be apprehended in the navigation of modern steam-ships, and no one thing will contribute more to lessen this risk than the establishment of lane routes in the now already crowded North Atlantic.

My own view is that the lanes we have adopted are the most prudent, viz., to keep south of 42 when crossing the meridian of 50, from the 15th February to the 15th August, and a safe distance south of the Virgins the rest of the year, separating east-bound and west-bound tracks at the meridian of 50° about 1°.

While we pursue this practice with the steamers under our management—some twenty-six—the good effect thereof is, of course, almost negative so far as the lane feature is concerned, because the practice is not general.

Extract from Letter written by W. Bussius, North German Lloyd's Steam-ship "Werra," April 13, 1889.

I would say that in the vicinity of Long Island, Nantucket, and St George's shoal-grounds, I think it absolutely necessary to establish lanes for steam-ships apart. This can be done very easily, even if astronomic observations are not at hand and the position of a ship doubtful.

A westward-bound ship to keep north; that means on 40 to 35 or 30 fathoms of water by soundings, when thick weather prevails. Here the ship will find pilots, as their position is in this line.

An eastward-bound ship ought to steer from Sandy Hook east by south one quarter south to the 90-fathom soundings, then east on deep soundings. This will cause steamers to go safely almost 50° west, if the eastward-bound steamers keep warm water during summer, or say, in latitude 41°. I have proved it dozens of times, that in summer a distance of 80 to 90 miles is gained eastward by the Gulf Stream between Sandy Hook and Scilly, if I kept well to the southward. I shall not fail to run these southern routes this summer.

Extract from Letter written by Arthur W. Lewis, Master, Steam-ship "City of New York," 1889.

With regard to perfect safety, lane routes, especially on the Atlantic, are greatly to be desired.

During the ice season on the Atlantic, ships bound east ought to make the lane routes in the great circle that crosses latitude 40° N., longitude 50° W.; those coming west, latitude 41° and 50° W.

Northern routes about 40 miles south of Virgins, bound west, to latitude 43° and longitude 50° bound east.

Fishermen on the Grand Banks, as well as in other portions of the globe, ought to have defined grounds to operate in and out of them, and to be there at their own risk.

Extract from Letter written by Captain Horatio McKay, of the Cunard Steam-ship "Aurania," March 1889.

In regard to my opinions about ocean tracks, lengthened experience only serves to emphasize present views, . . . namely, definite easterly and westerly tracks more or less south of the Banks. I am still strongly impressed with these conclusions, notwithstanding the steady adherence to the northerly route by the great majority of steam-ship lines.

Proposal as to Lanes for Steamers.

It can hardly be doubted that lanes or tracks for coming and going steam-ships would in a great measure tend to increase the safety of navigation, and that such tracks might be laid down, not only on the large oceans but also on many of the local waters, in this case considering the North Sea, the Baltic, the English Channel, &c., as local waters. The advantage derived from such tracks would not only consist in the fact that steamers would avoid, to a certain extent, the danger of meeting other steamers end on, but also that the Chart would give warning to the navigator whenever another track was crossing his, as well as that it might be expected that sailing-vessels would do their best to keep out of these tracks, especially in the night-time. Nevertheless, whenever a discussion upon the subject has taken place, it has always been argued that, taking in consideration the difference in tonnage, speed, load-line, &c., of screw-steamers—in fact, the difference as to the sea-going qualities between different ships, it would hardly be fair to force all steam-ships, under all circumstances, to follow a prescribed track from which they were not permitted to deviate.

Admitting, however, that it would be unfair to lay down compulsory tracks for steam-ships, would it not tend to the safety of navigation if tracks were laid down on all Charts? If such tracks, marked, "Non-compulsory tracks for screw-steamers," their position being, of course, decided by the various Maritime Powers, were laid down on all Charts, it can hardly be doubted that the steam-ships, if possible, would follow them voluntarily, and that the sailing-vessels would do their best to keep out of them. The black line in the Chart would of itself be a warning to the mariner every time he looked at it.

My proposal would therefore be that such non-compulsory tracks for screw-steamers should be laid down on all Charts, whenever it was found possible to do so, while, as a matter of course, I shall not offer any opinion about the way in which the work should be divided between the different seafaring nations.

(Signed) JACOB HOLM, *Master Mariner.*

Copenhagen, September 9, 1889.

Ocean Lane Routes.

Sir, 10, *Water Street, Liverpool, November* 12, 1889.

We beg to hand you annexed copy of a letter addressed by our senior, under date 1st January, 1876, to the Secretary of the North Atlantic Steam Traffic Conference here, relative to the adoption of the lane routes advocated by Lieutenant Maury, U.S.N. (*vide* inclosed Track Chart).

At the time this letter was written a way could not be found to secure unanimity among the various lines interested, and there has continued up to the present time considerable divergence of practice in regard to the tracks followed by the steamers employed in this much-frequented ocean highway, which neutralizes in a great measure the advantages, in point of safety, that may be derived from the adoption of well-defined routes by certain lines.

We have been disappointed not to see any reference to this subject in the cable reports of the proceedings of the Conference, and should be sorry if the sittings were to close without so important a question being included in the deliberations, especially as Lieutenant Maury's proposals offer so simple and efficacious a remedy.

We sincerely trust that the Conference may have seen their way to deal with this long-standing difficulty, and that Regulations may be adopted which may tend still further to promote the safe navigation of the North Atlantic.

We remain, &c.
(Signed) ISMAY, IMRIE, AND Co.

Lane Routes.

Dear Sir, *White Star Line, Liverpool, January* 1, 1876.

Referring to the failure to agree upon an International Rule obliging all steamers passing between Europe and North America to follow fixed lane routes (which, personally, I much regretted at the time), and having since given a good deal of consideration to the matter during four Transatlantic passages, made within the past eighteen months, I have determined, as far as practicable, with the Company's steamers, to follow Maury's steam lanes, and would suggest that a Conference be called, to consist of a nautical and lay representative from such of the European lines as may respond to an invitation to be issued by the North Atlantic Steam Traffic Conference, and that a Committee thereof make a Joint Report, to be unanimously adopted, the responsibility of non-agreement to rest with those who do not accept the Committee's recommendation.

These lanes, if generally adopted, would, I think, materially lessen the risks of collision and ice.

Pending the discussion of this subject on the part of the Conference, the commanders of the White Star steamers are instructed to follow the routes named.

I am, &c.
(Signed) THOMAS H. ISMAY.

Gray Hill, Esq., Secretary,
North Atlantic Steam Traffic Conference.

Report of Ensign George P. Blow, in charge of Branch Hydrographic Office, New York City, on General Division VII.

There can be no doubt as to the great desirability of establishing a system of ocean lanes for vessels navigating much-frequented routes. While such lanes can obviously be followed only by steamers, their importance is probably much greater to vessels depending upon sail alone. By adopting such a system of well-defined routes, the steam tonnage of all nations will concentrate at certain points, leaving the rest of the ocean free to sailing-vessels, thus greatly diminishing the risk of collision. The captain of a vessel disabled or in need of provisions or water would then know at once where to go to get assistance, and would shape his course accordingly. Fishermen would carry on their hazardous occupation without the constant fear of being run down by one of the great ocean racers, and pilot-boats could

cruize across the track of incoming steamers with an absolute certainty of meeting them. It would be a comparatively easy matter to keep these lanes free from wrecks, derelicts, or other obstructions, and as all passengers are carried by steamers, the safety of life at sea would be much better protected than at present.

Speaking in general terms, therefore, the proposed ocean lanes should be as nearly as possible great circle courses, making a liberal allowance for all rocks, shoals, islands, and other natural obstructions. Care should also be taken to lay down these routes so as to avoid the ice and fog limits, and not to pass through the great fishing-grounds. The outward- and homeward-bound tracks should be about 1°, or 60 miles, apart, so as to avoid all possibility of vessels getting on the wrong lane. Where practicable, the lanes should be arranged so that all vessels follow the old rule of keeping to the right, and in passing keep each other on the port hand. This rule should apply also to inland waters and along the coast from headland to headland. Thus a vessel passing through Long Island Sound would keep to the southward when going east, and to the northward when coming west. Coasting-vessels leaving the land on the starboard side would keep as near inshore as the safety of navigation would allow, while those having the land on the port, or left side, would take a parallel course at least 5 miles further off shore, or as far out as the limit of visibility of the different lights would allow. Where these routes cross fishing-grounds frequented by a very large number of vessels, a détour should be made, if possible. These lanes should be mapped out by the nations whose shipping is most directly interested.

It is believed that the use of these ocean lanes cannot be made obligatory, and can only be recommended to navigators, as it would be impossible to enforce any law requiring vessels to use them.

With regard to the ocean lanes in the North Atlantic Ocean, the following is respectfully submitted.

The great dangers to be avoided are:—

1. Foggy weather and the consequent danger of shipwreck and collision.
2. Collision with icebergs.
3. Collision with derelicts.
4. Collision with fishermen.

In laying out the ocean lanes, therefore, it is necessary to carefully avoid passing through the portions of the ocean where these dangers are the greatest, and at the same time to utilize the force of the Gulf Stream where possible.

By plotting the southern limit of fogs and ice for each month of the year, it has been found that great circle-courses from Boston, New York, Delaware Bay, and the Chesapeake Bay to latitude 40° N., longitude 50° W., all pass clear of the fog limits for nearly the whole year and through the southern limits for the rest of the time. These courses also pass entirely clear of the fishing-grounds and ice limits, and may be considered as safe. Similarly, great circle-courses from latitude 40° N., longitude 50° W., to the Straits of Gibraltar, English Channel, &c., also pass clear of the fog limits. These courses are further to the southward than the dotted course laid down on the Chart, and which is the very shortest practicable route, but they have the great advantage of being in the full strength of the Gulf Stream, which more than makes up for the loss going east. The homeward-bound trip to the westward is more to the northward, so as to keep to the right and also to avoid the Gulf Stream. In this case, latitude 41° N., longitude 50° W., is taken as the point of concentration, as shown on the Chart. In certain seasons of the year vessels can go further north than this with safety, and will undoubtedly do so in spite of whatever ocean lanes may be selected. It is recommended, therefore, that the steamers bound east be required to go to the southward of the courses laid down, and that steamers bound to the westward shall be required to keep to the northward of the course shown on the Chart. It is thought that this will have the desired effect. The difference between the shortest course (dotted lines) and the course laid down is only about 180 miles. If steamers are required to go at the rate of half speed in fog, and this law is really enforced, as it should be, there will be no trouble in arranging the ocean lane system, for it will be both to the interest and comfort of the captain, the interest of the owners, and the comfort and safety of the passengers, to take the route laid down. This is the only way in which the ocean lane system can be enforced by enforcing the law limiting the speed of vessels in a fog.

The captains of all large steamers are both willing and anxious to keep clear of the fishermen, fog, and ice, but are required by the owners to make quick trips. To do so they must go to the northward on their trip west, and are compelled to take the risk of running at from 15 to 20 knots an hour through thick fog in order to save time.

Captain Kennedy, formerly in command of the Steam-ship "Germania."

Captain Kennedy strongly advocates the use of the ocean lanes, and suggests for vessels bound east that they should cross the meridian of 50° W., between 41° and 42°, while vessels bound to the westward should cross between 42° and 43°. This would not only tend to lessen the danger of collisions with other steamers, but it would enable the fishermen on the Banks to keep clear of the ocean routes in good weather, and all vessels, in case of being disabled, to know where to go for assistance. The case of the "Danmark" is a very good illustration of this point.

Sergeant Paul Daniels, United States' Signal Service.

To avoid collisions, it is suggested that steamers on frequented routes should be compelled to observe the following rules:—

Steamers going east should make their course on a parallel of latitude which would carry them a little more north or south of the course which the west-bound steamers would be likely to take; also the Transatlantic steamers should be required to keep at least 60 miles to the southward of the George's Banks, thereby keeping clear of fishermen.

D. A. Nash, Pilot Commissioner of New York.

Fixed routes or lanes for fast steamers, especially between Atlantic ports, are very desirable.

Report of D. T. Terrell, Ensign, United States' Navy (in charge of Branch Hydrographic Office, Portland, Oregon), concerning opinions of seafaring men whom he has interviewed.

All recognize the advisability of lanes of traffic in much-frequented seas, and especially recommend lanes across the Newfoundland Banks, and the prohibition of vessels crossing in any other track at night or during thick weather.

New York Branch Hydrographic Office.

Lanes for steamers on frequent routes, as England-New York.

(*a.*) Permanent lanes cannot be prescribed for the regular lines, as the conditions of ice are not alike every year. A general agreement, however, would be desirable, resulting in Rules requiring every steamer to follow a northerly course to New York, and a southerly course from New York, *i.e.*, of the 50° longitude (Newfoundland Banks), coming from Europe northerly and going to Europe southerly.

The total avoidance of the fishermen on the Banks is impossible.

Philadelphia Maritime Exchange.

Adopt lanes for steamers on frequented routes, which shall be 50 miles apart in mid-ocean, and which shall avoid known fishing-grounds, especially the Banks of Newfoundland.

Wm. C. Whittle, Captain, Bay Line Steamer "Georgia."

I believe that the establishment of "lanes" for steamers on frequented routes going in opposite directions would greatly promote safety of life and property. I question the feasibility of absolutely maintaining such "lanes," but in proportion, as the number of steamers meeting is decreased, the chances of collision would be lessened.

The navigators, however, should be warned not to presume upon the effort to establish these "lanes," or lulled into any feeling of security, or any lack of vigilance, upon the hypothesis that a lane system is maintained. They should be cautioned that, although a man may be in his "lane," if he meets a steamer he must not arrogate to himself any rights or privileges not given him by the "Rules of the Road."

General Information gained in Interviews with Masters of Vessels at the Branch Hydrographic Office, Boston.

In the matter of "lanes for steamers on frequented routes" there will undoubtedly be great opposition to any move in this direction. Most steamer captains are thoroughly convinced that the ocean belongs especially to them, and that they have a perfect right to go on it where they please. Notwithstanding the fact that a few hours at the most will cover the difference between the route passing clear of the Banks of Newfoundland to the southward and a more northerly route—crossing, say, about the middle of the Bank—with the additional advantage in favour of the former that there is very much less likelihood of encountering fog, many masters of steamers persist in following the route across the Banks, regardless of the lives of the fishermen who depend on these same Banks to furnish a living for themselves and families. I can see no reason why steamers should not be obliged to follow certain routes, differing for the different seasons of the year. It would frequently cause a slight lengthening of their voyages, but would very greatly increase the safety of ocean travel. In the summer, or ice season, the prescribed route should pass clear of the tail of the Banks to the southward. In the winter, or safe season, it should pass near Cape Race. If it is decided that steamers must cross the Banks, then a specified route across them should be prescribed, and fishermen should be required to keep clear of this track. In deciding this question, in reference to the Banks of Newfoundland and other similar localities, preference should undoubtedly be given to the rights of the fishermen. The only practicable solution of the question of lane routes with regard to the avoidance of collisions between steamers is by the separation of the eastern and western routes by a degree at least, but it is claimed by many masters of vessels that it would not work in practice. In thick or foggy weather, with no observations to verify the position, no vessel could be sure that she was in the right path.

During heavy weather vessels are likely to be driven out of their way. In various ways vessels are likely to find themselves not only out of their own track, but directly in the track of steamers going the opposite direction. On the other hand, in the case of steamers proceeding in the same direction, the difference in speed is often so great as to render a collision between them almost as serious as if they had met bows on. There is of course a possibility that any one or all these things may occur, but, to my mind, they detract nothing from the wisdom of the proposed separation of the routes; there could be no more danger than under the present condition of things, under which steamers apparently follow a go-as-you-please policy, and there is every reason to believe that the proposed system would operate to the greatest possible advantage. Ordinarily there would be no excuse for a master of a vessel to fail to keep his ship in the proper track, and under no circumstances would there be any more danger than at present exists at all times at sea.

Discussion before the United States' Naval Institute, Annapolis, Maryland, on Collisions at Sea.

Lieutenant McCarteney.—The recommendation of the employment of different routes for eastward and westward-bound vessels is not the least important of the suggestions made, but the difficulty has been to have these recommendations followed, each captain being naturally desirous of shortening his voyage as much as possible.

There can be no doubt how greatly the adoption of a route to go and another to return will conduce to safety. With these routes, varying with the seasons, and sufficiently separated to avoid the possible danger of a vessel which is following one from drifting into the other, from not having had observations for two or three days, the chances of collision will be much lessened. The United States' Hydrographic Office, in its monthly publication of the Pilot Chart, has for a long time earnestly advocated this subject, and each month calls special attention to the best Transatlantic steam-ship routes.

In his Annual Report to the Bureau of Navigation the Hydrographer says: "Every effort has been made to collect the latest and most reliable data concerning ice in the vicinity of the Grand Banks, but very few Reports have been made of this great danger south of the parallel of 45° N. The Transatlantic routes as laid down on the Pilot Chart seem to have been adopted by the Boston steam-ship lines more generally this year than ever before, which accounts in part for the scarcity of ice reports. Many captains have been inclined to regard the recommendations as unnecessarily cautious, but such illustrations as the collision of the 'Geiser' and 'Thingvalla' affords have convinced the most sceptical of their value. The routes of the various Transatlantic steamlines are slowly but surely drawing together, and while in all probability they will not reach the extreme limit for ice-season travel recommended by the Chart, they will approximate to it, and the adoption of one path each way for all will be a great improvement.' An objection raised to the Pilot Chart routes by Captain Banaré, of the French Hydrographic Office, is that they are not widely enough separated, thus giving opportunity for the possible error previously mentioned, due from lack of observations, wild steering, &c.; but this is a very minor point, and could be easily remedied when certain fixed limits have been adopted and vessels rigidly required to observe them.

In the second part of "Les Collisions en Mer," recently published in the "Annales Hydrographiques," Captain Banaré says that "in giving to navigators a regulation that offers a guarantee of security the tendency would be to diminish the watchfulness on board ship by raising a feeling of false confidence on the part of the captain, from the certainty which he would have that all vessels moving in the contrary direction would follow the official route; also that the lengthening of one of the routes, which would be the natural consequence of the adoption of the double track, could be another element of danger, inasmuch as all vessels would then maintain an exaggerated speed, not only in foggy weather, but at all times, so that the number of collisions, instead of diminishing, would be considerably increased." It is hardly probable that, should such routes be adopted, a captain would take upon himself the responsibility of leaving his proper track, knowing that in case of collision he or his Company would be held responsible for the loss of life and property incurred. Still less would this be apt to occur in thick weather.

Ensign Hayden.—"If it were possible to determine for each voyage a route to go and another to return, the chances of collision would be greatly diminished. But a similar project, applicable only to steamers, and which does not prohibit the crossing of the routes, has raised so many objections that it appears to be abandoned. Notwithstanding, there are localities, like those of the Banks of Newfoundland, for instance, where we find a great number of vessels assembled unable to manœuvre, and for whom it is desirable to enforce some special conservative (protective) measures."

This question of the best regulation of steam traffic across the Grand Banks seems to be one of the most important as well as difficult problems that can come before the Marine Conference, and I am inclined to doubt whether this or any other Conference will be able to agree upon and enforce any set of Regulations that will improve, to any appreciable extent, the present status of affairs. Nevertheless, it should be thoroughly considered from every point of view, and an International Tribunal is the only one that can properly do so. Moreover, the results of the deliberations of the Conference in other directions—its decisions as to lights, fog-signals, and Rules of the Road—have such an important bearing upon this question that its consideration may best be taken up after other points have been definitely decided.

From my connection with the publication of the Pilot Chart, I have of necessity considered this subject very carefully, and perhaps, on that account, more fully appreciate the difficulties in the way of the adoption and enforcement of any hard-and-fast regulations or restrictions regarding Transatlantic steam navigation. So many things enter as factors in the problem, and with such constantly varying force, that I must deprecate the hasty adoption of any of the specious and plausible schemes that look so well on paper and yet would never work in practice.

"The longer any one studies a vast subject," says Professor Bryce in "The American Commonwealth," "the more cautious in inference does he become." The world-renowned Maury even proposed a plan of "lane routes," and, although it has still a prominent existence on paper, yet it has not now, and really never did have, any particular force in practice.

With the Pilot Chart for December 1887 there was published a brief discussion of this subject, and certain routes were recommended. The plan thus initiated has been adhered to since that date, so far as recommendations go, and a brief résumé may therefore be of interest.

Eastward Bound.—Follow this track, or nothing to the northward of it. Leaving New York, steer for latitude 40° 26′ N., longitude 73° 46′ W., thence E.S.E. ½ E. to the 100-fathom line, then deep soundings, and off-soundings, crossing 60° W. in 42° N. and 50° W. in 45° N.; thence follow the great circle, crossing 40° W. in 48° 01′ N., 30° W. in 49° 56′ N., 20° W. in 50° 55′ N., and 10° W. in 51° N.

Westward Bound.—Follow this track, or nothing to the southward of it. Cross 10° W. in 51° 10′ N.; thence following the great circle, crossing 20° W. in 51° 16′ N., 30° W. in 50° 28′ N., 40° W. in 48° 46′ N., and 50° W. in 46° N. Cross 60° W. in 43° N., 69° W. in 40° 38′ N.; then keep inside 30 fathoms, steering to cross 74° W. in 40° 30′ N.

With the addition of a route from the English Channel (course about west by north), joining the west-bound route in about longitude 20° W., and the shifting of both routes to the southward during the ice season, this plan has been consistently and persistently recommended on the Pilot Chart, and many letters of approval have been received from practical navigators and others. The main feature of this plan is, it will be noticed, to keep to the right of a narrow central belt, whose limits are accurately defined, both graphically and by means of a detailed printed description. Westward-bound vessels are thus enabled to take avantage of the Labrador current, shaving Cape Race, if they choose, and eastward-bound vessels can go as far south as they please, to take advantage of the Gulf Stream and the easterly drift-current in mid-ocean. At the same time, in the central belt the danger to the fishing fleet and other vessels is at a minimum; to the north of this belt danger is to be looked for principally from the east, and to the south of it from the west.

Neglecting the fact that different ports of departure and arrival must always interfere with this or any other plan, I may refer to certain other difficulties that may or may not prove insuperable. In the first place, there is the self-evident truth that this great highway of steam navigation, the connecting link between the Old World and the New, is of vast and steadily increasing importance. Even now, although it is traversed yearly at almost railway speed by vessels intrusted with more than a million human lives, and property of an aggregate value of fully a billion dollars, the inventive genius of the age is devoting its best energies toward meeting the demand for better, larger, faster, and safer vessels. The steam-ship that breaks the record and carries the pennant for the best passage becomes famous, and her success is heralded to the four corners of the earth. Now, this fact indicates "a condition, not a theory;" it means that there is a demand that must be considered and complied with, and Regulations that lose sight of, or attempt to discountenance it, are as absurd as would be an attempt to regulate by Statute the speed of railroad trains.

Again, general averages regarding the limits of ice off the Grand Banks are often of no earthly use so far as any particular season is concerned; the present season, for instance, has been a marked exception, almost no ice at all having been reported. The usual or normal limit of drifting ice cannot therefore be considered, and we must base our routes upon the conditions that actually exist, as reported by incoming vessels or by telegraph from St. John's. Another important element is the fact that the mails are given to the fastest vessels. One steamer may take a safer route, traverse a slightly longer distance, and lose the mail; this very thing happened only last year, when the "Werra" was beaten a few hours by the "Servia," and Captain Bussius complained that he had followed the route recommended and lost the mail in consequence. This question should therefore be carefully considered, and Postal Regulations framed accordingly.

Last, but by no means least, all possible reasonable precautions should be taken to avoid unnecessary danger to the brave fishermen who follow their hazardous occupation on the Grand Banks and adjacent fishing-grounds, constantly exposed, in their little sailing-vessels, to all the dangers of this stormy coast, and surrounded half the time by dense fog that gives them scant notice of the approach of one of the rushing ocean greyhounds, whose sharp bow would cut them through like a knife. In this connection let me quote from Captain J. W. Collins, of the United States' Commission of Fish and Fisheries, whose long experience and intimate acquaintance with all the circumstances of the case render his opinion of great value.

Captain Collins says, in a letter dated Washington, 12th April, 1889:—

"So far as any plan is concerned to secure the safety of fishermen upon the Banks by the recommendation of definite lines of travel for ocean steamers, I give as my opinion that it would add much to the safety of fishermen if lines could be established during the greater part of the year which would take the steamers south of the Grand Banks. From March to November there is a large fleet fishing upon the Grand Bank, aggregating somewhere from 500 to 700 vessels, belonging to the United States, British North American provinces, France, and Portugal. A comparatively small number of vessels, principally from the United States, fish upon the Grand Bank throughout the year. The fishing-grounds extend from about 42° 57′ north latitude, which is practically the southern limit for halibut, to the northern margin of the Bank, and sometimes even beyond it. I appreciate the obstacles which might be met with in an attempt to prohibit steam-ships from crossing the Grand Bank, since I realize the force of your statement that the Banks cannot be 'fenced in.' I think, however, that, considering the danger incident to the crossing of the Banks in the spring, summer, and autumn, when fogs are prevalent, it would be vastly to the advantage of the fishermen, and an act of humanity, if the steam-ship lines could be arranged to pass south of the Grand Bank from March to November. In winter, the vessels fishing upon the Grand Bank are generally collected about its southern extremity, where they go to fish for halibut. I would say that at that season the danger to fishing-vessels would not be

so great, if steamers are to cross the Grand Bank anyhow, if the crossing were made north of the 44th parallel of north latitude, or about where it is limited on the Chart you have sent me. A very slight deflection, to avoid the southern point of Banquereau, would take the ships clear of all fishing-grounds resorted to west of the Grand Bank, and would carry them far enough north so that they would not come in contact with the majority of the fleet, at that time fishing on the latter Bank. I have drawn in, roughly, lines which I would suggest for spring, summer, and autumn travel, from March to November, so arranged that the northernmost would just clear the southern prong of the Grand Bank. I most earnestly hope that the Steam-ship Companies may be disposed to adopt some system which will relieve the fishermen from the perils now encountered by them in consequence of Transatlantic steamers crossing the Banks. It seems that this might be done without material disadvantage, for the presence of ice enforces the deflection I have suggested for a part of the year, and there would only remain a comparatively short time when the Transatlantic trade would have to diverge from the course heretofore followed in late summer and autumn."

These considerations seem to me be the principal ones that have an important bearing on the question, and serve to illustrate its complexity and the difficulty of a practical solution that will be advantageous all around. Evidently, conflicting interests must be considered, and a compromise effected, or else the whole thing left *in statu quo*. When we consider, however, the enormous importance of Translantic steam navigation, the demand for great speed and quick passages, the fact that the shortest route is close to Cape Race, that storms, fog, and ocean currents enter as a factor less and less every year, that a single great ocean steam-ship, carrying the Transatlantic mail, and straining every nerve to lessen the gap that separates the Old World from the New, represents almost, if not quite, as great a value in number of lives and amount of property as the entire fishing-fleet of every nationality; considering all these things, I must say it seems to me that all other interests are necessarily subordinate, and any Regulations likely to be effective must be framed accordingly.

Washington, D. C.

Appendix (B).

Report of Committee No. 2 on Lanes for Steamers on Frequented Routes.

(General Division VII.)

Sir, *Boston, October* 17, 1889.

LEARNING of the proposed Conference of nations on the subject of Maritime Regulations, George V. Steele, Esq., President of the Gloucester Mutual Fishing Insurance Company, in the interest of the American fishing-vessels, addressed a Circular to many masters of fishermen asking information as to the dangers of the fishing banks caused by steamers. A few specific answers were received, many remain unanswered.

I transmit, at his request, the accompanying Circular and answers for your consideration.

I am, &c.

(Signed) CHAS. L. WOODBURY.

To the Hon. Secretary of State,
Washington, D. C.

Circular.

Have any vessels disappeared under circumstances which induce the opinion that they have been run down by any steamer or steam-ship and are a total loss?

Do you know of any that have had narrow escapes?

Give the names of such vessels, the date and situation when last seen, and also state the circumstances so far as you have learned them.

June 26, 1889.

Replies.

I have several times narrowly escaped being struck by steamers in thick weather, both while lying at anchor and under sail, on and in the neighbourhood of fishing-grounds. In some instances the steamer has been almost upon me before her way could be stopped or course changed. I have no particular instance in mind.

(Signed) SAMUEL HILTZ.

On the north-east part of George's had very narrow escape from being run down by steamer at night, it being thick fog at the time. She came within 75 feet, and would have run over the vessel if had not been for our torches and horns. This was last February, in schooner "Carl Schurz."

(Signed) JOHN CONSTANCE, *M.*

Schooner "Golden Hind," in 1885, on southern edge of George's, at night, had a narrow escape from collision with steamer. We were lying to, and steamer came so near that we hauled up the boat to leave the vessel, but after showing our torch and making a noise she kept off.

(Signed) RUBEN CAMERON.

Schooner "James A. Garfield," in 1886, in longitude 60°, latitude 43° 30′, had narrow escape from being run down by steamer at 10 o'clock P.M. She came within 25 feet of the vessel, and changed her course when we showed our torch.

(Signed) THOMAS BOHLIN, *M.*

I don't know of any vessel being run down by a steamer, but have had several narrow escapes from steamers going at full speed across the Banks.

(Signed) CHAS. PETERSON, *P.*

Have been master to the "Grand Banks" ten years. The passage of steamers across the Banks is, in my opinion, very dangerous, and I have no doubt that vessels have been run down by steamers in foggy weather. Have seen steamers daily when fishing on the Banks, and have heard their whistle in foggy weather.

(Signed) JOHN GAURVILLE.

Report of Committee No. 2 on Night Signals for communicating Information at Sea.

(General Division VIII.)

Members of the Committee:

Denmark	M. GARDE.
France	Captain LANNÉLUC.
Germany	Captain DONNER.
Great Britain	Admiral BOWDEN-SMITH.
Hawaii	Mr. H. A. P. CARTER.
Portugal	M. SOUZA ROZA.
Sweden	Captain MALMBERG.
The Netherlands	Captain HUBERT.
United States	Captain SHACKFORD.

Sir, *Washington, December* 6, 1889.

WITH regard to sub-sections (*a*) and (*b*) of General Division VIII, the Committee have considered systems of night signals with ordinary coloured lights, but the objection exists that they cannot be seen so far as a white light. It is the opinion of the Committee that night signalling at sea can better be carried on by a system of long and short flashes from a white light than by any system in which coloured lights are used.

The Committee have concluded that the systems of signalling by pyrotechnic lights which have been brought to their notice are too expensive for general use.

The Committee have had before them "A Supplementary Code of limited scope to convey information of special importance to passing vessels," which has been prepared by a Committee of the British Board of Trade, and has been presented by the British Government to the various Powers for their consideration.

Your Committee, after careful consideration, suggest that the Conference recommend the adoption, for optional use, of that Supplementary Code, with the following change, which will become necessary if the Conference adopt the signal suggested by the joint Committee on Pilot Signals, viz.: To strike out signal PG, "Beware of derelict dangerous to navigation," and substitute in its place NP, "I want assistance. Remain by me." Appendix (A) contains this Supplementary Code as amended.

To illustrate the importance attached to the subject of night signals, the Committee refer to the great number of proposals on that subject mentioned by the Report of the Committee on Systems and Devices.

That part of the proposed amendment to Article 27, entitled extra amendment No. 6, which reads as follows:—

"Vessels in want of a pilot have to display their national flag with a white border or make the signal indicated by PT at the fore.

"At night, together or separately.

"The pyrotechnic light, commonly known as a blue light, every fifteen minutes, or a bright white light, flashed or shown at short or frequent intervals just above the bulwarks for about a minute at a time,"—

which was referred to this Committee, the Committee find, is already included in the International Code Signal book under the head of pilot signals; the Committee, therefore, recommend no further action on the amendment.

With reference to the twenty-third amendment to Article 4, viz., "A tug wishing to offer her services to a vessel shall exhibit to such vessel, in addition to the ordinary lights, a white and red flare-up alternately," which was referred to this Committee, the Committee beg leave to report that they do not think it expedient to allot any special signal to vessels of this class.

Sub-section (*e*) referring to distress signals was not considered, as it has been disposed of by the Conference.

In compliance with the Resolution of the Conference referring to this Committee, assisted by the Committee on Sound-Signals, the subject of fog-signals to be allotted to pilots and to vessels seeking pilots, the Joint Committee met and decided upon the following signals:—

For vessels requiring pilots—a prolonged blast followed by a short blast, ——— —

For pilots wishing to offer their services—short blast followed by a long blast, — ———

And the Committee recommend that they be inserted in the International Code Book under the Pilot-Signals.

While considering the subject of signals to convey information of special importance to passing vessels, the decision of the Conference in adding to the signals now in use, consisting of short and long blasts, and the favour in which such signals seem to be held, and the convenience which an extended use of such signals would be to mariners, have led the Committee to consider the benefits which might accrue from the more general use of the Morse system now in use by the navies of various Powers.

Up to the present time no better system seems to have been devised for signalling purposes; it is one which can be used under all circumstances, it is readily acquired by young persons of ordinary ability, and is already taught on some training ships. If its use were encouraged it might lead to the study of the Code by more young men qualifying as officers of the merchant marine, or as signalmen, and thus come into more general use.

Such studies are beneficial in developing the intellectual activity of seamen, and every accomplishment of the kind acquired and made necessary by the requirements of the service helps to develop the *morale* of the sailor.

To thus encourage the use of the system the Committee suggest to the Conference that the complete alphabet of the Morse Code be inserted in the revised edition of the International Code Book for optional use.

(Signed) AUG. GARDE, *Delegate for Denmark.*
HENRI LANNÉLUC. *Delegate for France.*
CHRISTIAN DONNER, *Delegate for Germany.*
N. BOWDEN-SMITH, *Delegate for Great Britain.*
H. A. P. CARTER, *Chairman of Committee, Delegate for Hawaii.*
T. DE SOUZA ROZA, *Delegate for Portugal.*
FREDERICK MALMBERG, *Delegate for Sweden.*
D. HUBERT, *Delegate for the Netherlands.*
JOHN W. SHACKFORD, *Delegate for the United States.*

The Undersigned desire to record that in signing the above Report they do so without prejudice to the opinions they hold as to the desirability of giving special signals to use with fog-horns on board pilot-vessels.

President of the International Marine Conference, &c.

Appendix (A).

A Supplementary Code of the British Board of Trade, as amended and recommended, and forming a part of Report of Committee No. 2 on Night Signals for communicating Information at Sea.

(General Division VIII.)

IMPORTANT signals which may be made at night or during fog, either by flashes of white light or by a combination of long and short sounds on the steam-whistle, fog-horn, siren, bugle, &c. In the daytime they will be made by flags.

Instructions for the Use of Flashing or Sound-Signals.

(1.)

With flashing signals the lamp must always be turned towards the person addressed.

(2.)

To attract attention, a series of rapid short flashes or sounds should be made and continued until the person addressed gives the sign of attention by doing the same.

If, however, it is supposed that the person addressed cannot reply, the signal may be made after a moderate pause, or, under certain circumstances, the communication may be made direct without preparatory signs.

(3.)

After making a few rapid short flashes or sounds as an acknowledgment, the receiver must watch or listen attentively until the communication is completed, when he must make the sign indicated below, showing that the message is understood.

(4.)

If the receiver does not understand the message, he must wait until the signal is repeated.

(5.)

Duration of short flashes or sounds	1 second.
„ long „ „	3 seconds.
„ prolonged sound	4 to 6 seconds.
Interval between each flash or sound	1 second.
Answer, or "I understand" ... ... — - — - — - — -	&c.

Report of the Committee upon General Divisions IX, X, XI, *and* XII *of the Programme.*

Committee:

Austria-Hungary ..	..	Lieutenant Sanchez de la Cerda.
China	..	Captain Bisbee.
France	..	M. Ribière.
Germany ..	..	Captain Mensing.
Great Britain ..	..	Admiral Nares.
Norway	..	M. Flood.
Siam	..	Mr. Verney.
Uruguay.. ..	..	Dr. Alberto Nin.
United States ..	..	Captain Sampson.

Sir, *Washington, D.C., December* 1889.

IN submitting their Report the Committee have thought it the most convenient plan to deal separately with each of the General Divisions which have been discussed and considered by them.

General Division IX.

Warnings of approaching Storms.

(*a.*) The transmission of warnings.
(*b.*) The uniformity of signals employed.

(*a.*) The transmission of warnings.

The Committee understand that the various Meteorological Offices in Europe are in frequent and intimate communication, and interchange telegraphic information for the purpose of weather forecasting on that side of the Atlantic Ocean; while the Meteorological Offices of the United States and the Dominion of Canada act in concert on the western side; and also that a similar custom prevails in many Eastern countries.

The preparation of weather forecasts and the transmission of warnings regarding expected storms must, by the very nature of the subject, be dealt with locally; and it is in the opinion of the Committee very questionable whether any useful purpose would be gained by the adoption of uniformity of methods, except so far as the general progress of scientific knowledge indicates the direction of possible improvement; and this, it is hardly necessary to say, is more likely to be secured by work carried on independently rather than under any uniform system.

(*b.*) The uniformity of signals employed.

Storm-warning signals were first introduced in the interests of the shipping or fishing-vessels lying at anchor in harbour or proposing to put to sea. Lately the same warning-signals have been freely extended to coast stations, with a view to give information regarding the weather to passing vessels. Inasmuch as these may be local or foreign traders, the Committee are of opinion that such signals should, as far as possible, be in international agreement.

The established signals originally in use in Europe are evidently founded on the seamen's knowledge of the "Law of Storms," and, while warning him of an approaching cyclone, indicates whether the northern or southern portion is expected to pass over the district. Experience proves that this was practically sufficient information for the masters of vessels in a neighbouring harbour, who would know whether the cyclone was approaching or had passed, but it is scarcely sufficient for coasting vessels, especially those proceeding on a course at right angles to the direction in which the cyclone is moving.

In the opinion of the Committee it is therefore desirable that storm signals displayed at coast stations should give to passing vessels some further information as to whether storms are approaching, or have passed, the station; and, in reference to this, the Committee desire to call attention to the fact that this want has been supplied by the

system now in use in the United States. The German system indicates four directions from which a storm is expected, and whether its probable course is to the right or the left. (See Appendix C.)

In dealing with this matter the Committee have had the advantage of hearing the views of General A. W. Greely, the Chief Signal Officer in charge of the United States' Weather Bureau; and he has summarized them in a Memorandum contained under cover of a letter dated the 23rd December, 1889, both of which are appended to this Report, and to which the Committee desire to draw special attention. (See Appendix A.)

It will be seen that, in this Memorandum, General Greely has indicated the practical reasons for adopting, in lieu of cone-shaped signals, the use of coloured flags for notifying storm warnings on the coasts of the United States, which, it is claimed, can be seen (except in very calm weather) at a greater distance, and by means of which additional information can be given.

The Committee consider that this subject is of such a technical nature that they are not prepared to express a decided opinion upon it. They recommend, however, the Conference to invite the various maritime countries to consider the best practical mode of signalling by day, whether by shapes, coloured or black, by flags, or by the two combined, and by night by means of lights, coloured or white, arranged to represent distinctive forms.

Together with the Memorandum alluded to, General Greely inclosed a copy of "General Orders No. 29," dated from the Signal Office, War Department, the 11th November, 1889, from which a paragraph is quoted, and also a paper of diagrams showing the storm, cautionary, and wind-direction signals in use in the United States. These signals are reproduced in Appendix (B) to this Report.

In recapitulation the Committee recommend the Conference to invite the maritime countries interested to take into consideration the establishment of a uniform system of indicating storm-warnings by day and by night, and that such a system should, as far as possible, include signals indicating whether the storm is approaching or has passed the station.

Rear-Admiral S. R. Franklin, United States' Navy,
President, International Marine Conference, &c.

Appendix (A).

REPORT ON GENERAL DIVISION IX.

Warnings of approaching Storms.

Signal Office, War Department, Washington City,
December 23, 1889.

Sir,

IN compliance with the verbal request of your Committee, I have the honour and pleasure to herewith transmit a brief statement setting forth the methods in vogue giving storm-warnings, which is a concise reduction to writing of the statements made by me before your honourable Committee.

I also transmit a brief statement showing the system of storm-warning signals used in other countries. This statement depends on the official publications in this office, and in the case of some countries, as you will notice, is twelve years old. If more time had been available, possibly later information might have been obtained from some of these countries. As will be observed, Great Britain has modified its system by abandoning the drum. Portugal, also, which officially adopted the English system, though it is doubtful if it ever went into practical use, has replaced it by a system composed entirely of flags. The suggestions from Portugal are pertinent and forcible—that a common system should be used.

Regretting that I have not been able to give more definite and exact information to the International Congress which you represent, and regretting also that the urgency of action has given so brief a time for this summary, I am &c.

(Signed) A. W. GREELY,
Brigadier-General and Chief Signal Officer.

Chairman of Committee No. 3,
International Marine Conference, Washington, D.C.

Explanation of the System of Storm Warnings used in the United States.

The system recognizes the fact that the sailor has the right to expect information regarding coming gales; first, whether they are expected to be of moderate severity or of considerable violence; second, whether the storm signalled has passed him or is approaching him; and, thirdly, whether he is in the northerly or southerly quadrant of the more dangerous winds attending an approaching storm, or in the northern or southern quadrant of the high winds following in the rear of a storm.

With this in view, the first object has been obtained by recognizing the fact that danger is largely represented by the red colour, so that the more violent storms are represented by a square red flag, which has in the centre a small square of white.*

A yellow flag with a white centre indicates light storms.

In order to indicate whether the storm-centre is approaching or has not passed the station a red pennant is used, which thus indicates winds in the front quadrants of the storm, which generally are from south to north-east, and are considered the most dangerous on the American coast. In like manner a white pennant indicates that the storm has passed the station, and that high, clearing winds are expected from the north to the south-west.

In order to convey most simply to the sailor whether the expected winds will be in the northerly quadrant or in the southerly quadrant, the plan has been followed of having the pennant (whether red or white) above the square flag when winds are expected from the northerly quadrant, as naturally the sailor judges that anything which is above should indicate the north. Similarly winds from the southerly quadrant are shown by placing the pennant (whether white or red) under the square flag.

An additional signal, known as the "Information Signal," is displayed for the benefit of the mariner about to sail. It is a yellow pennant, and indicates that the Signal Office is in possession of information which may or may not be valuable. For instance, it very frequently occurs that vessels can sail, not only with perfect safety but with great benefit, in certain directions from the port, while on other courses dangers and delays would follow.

It may be stated that experiments have indicated to this office the decided superiority of flags with colour over-forms, such as spheres and cylinders. Unless the cylinders, cones, and balls are very large they cannot be distinguished under average conditions more than 2 to $2\frac{1}{2}$ miles, and observation has confirmed the theoretical knowledge that during the warm part of the day, or under any conditions where vertical air currents obtain, the distortion of the forms is so great as to render them indistinguishable and uncertain even at moderate distances. Experiments have also shown that the reds, blues, greens, and dirty whites tend to show up as black, and that the only light colour which holds its visibility as a colour at any considerable distance is yellow. It would thus appear that the red, being a pronounced danger colour, and the yellow, are the most suitable colours for storm-warning signals.

The white pennant now in use by the United States could, with advantage, be replaced by the yellow pennant, but it was not adopted owing to the prejudice which obtains in southern ports against the yellow flag, and the fear that the display of the solid yellow, such as is used in the pennant, might be mistaken for a "yellow-fever flag." The large yellow flag having a white centre is not so liable to misinterpretation.

The various systems of cautionary or storm signals in use by the several Meteorological Services are about as follows, as far as we are able to judge from the information contained in this office.

The system used by the London Meteorological Office for the British Isles, as described by Mr. Scott in 1887, was as follows: The day cautionary signal consisted of a cone 3 feet high and 3 feet wide at the base. Hoisted with the point downward, it indicated that a gale was probable from the south, and hoisted with the point upward to indicate that the gale would probably be from the north. Cautionary night signals of this system consisted of three lanterns, arranged in the form of a triangle representing the outline of a cone. The signals are cautionary, and the fact that such notice has been received at any station is made known by hoisting the cone, the meaning of which is a warning to sailors and others interested to "Look out; it is probable that bad weather of such and such a character is approaching you." In every case some of the principal reasons which have led to the hoisting of signals are briefly explained in the telegram, which should always be kept posted up for public inspection while the signal is flying. The Central Meteorological Office issues to ports and fishing-stations, approved by the Board of Trade, notices of approaching storms near the coast of the British Islands.

The system now in use in the British Islands is based upon the system adopted by Admiral FitzRoy in 1862, only it is less complicated. The FitzRoy system consisted of the north and south cones and combinations of these for day signals, and lanterns arranged in the form of a triangle or parallelogram to represent the cone and drum. The cone and drum were hoisted together—the cone above the drum with the vertex up—when the gale was expected to be first to the north and afterward shifting to some other quarter. The position of these symbols was reversed when the storm was expected to set in first from the south.

The Canadian system consists of a cone or cone and drum for the day signals, while the night signals consist of two lamps.

The Meteorological Department of the Government of India uses the following system of cautionary signals: Day signal No. 1, to indicate bad weather, or a warning signal, a ball. No. 2, a storm or danger signal, a drum. For a night signal No. 1, or bad weather signal, three white lights arranged in a vertical line. No. 2, storm or danger signal, two white lights arranged in a vertical line.

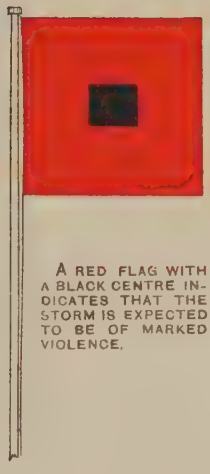
In a Report on weather telegraphy, by Robert H. Scott, Secretary of the Permanent Committee, the following replies relative to the systems of signals employed in the various countries for the

* This small centre of white is not a desirable or necessary part of the flag, and it was only adopted for reasons of economy, in order to utilize a large number of flags of this pattern which are on hand for use in army signalling.

UNITED STATES SIGNAL SERVICE,

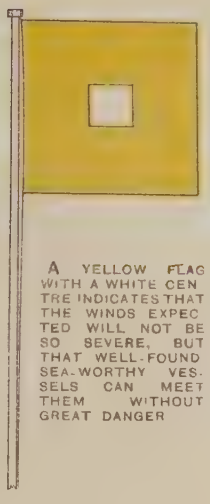
WIND SIGNALS.

Storm.



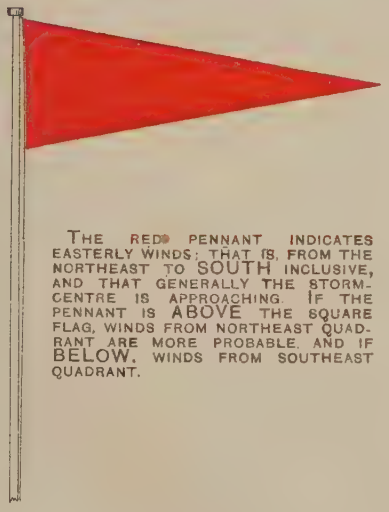
A RED FLAG WITH A BLACK CENTRE INDICATES THAT THE STORM IS EXPECTED TO BE OF MARKED VIOLENCE.

Cautionary



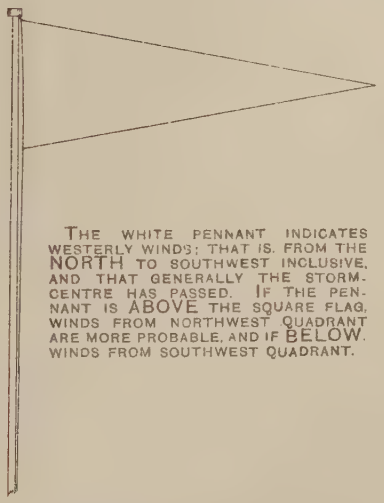
A YELLOW FLAG WITH A WHITE CENTRE INDICATES THAT THE WINDS EXPECTED WILL NOT BE SO SEVERE, BUT THAT WELL-FOUND SEA-WORTHY VESSELS CAN MEET THEM WITHOUT GREAT DANGER

Easterly winds.



THE RED PENNANT INDICATES EASTERLY WINDS; THAT IS, FROM THE NORTHEAST TO SOUTH INCLUSIVE, AND THAT GENERALLY THE STORM-CENTRE IS APPROACHING. IF THE PENNANT IS ABOVE THE SQUARE FLAG, WINDS FROM NORTHEAST QUADRANT ARE MORE PROBABLE, AND IF BELOW, WINDS FROM SOUTHEAST QUADRANT.

Westerly winds.



THE WHITE PENNANT INDICATES WESTERLY WINDS; THAT IS, FROM THE NORTH TO SOUTHWEST INCLUSIVE, AND THAT GENERALLY THE STORM-CENTRE HAS PASSED. IF THE PENNANT IS ABOVE THE SQUARE FLAG, WINDS FROM NORTHWEST QUADRANT ARE MORE PROBABLE, AND IF BELOW, WINDS FROM SOUTHWEST QUADRANT.

By night a red light will indicate easterly winds and a white light above a red light will indicate westerly winds.

A. W. GREELY,

Chief Signal Officer.

NOTE.—Hoisting signals for each quadrant is an opinion only, offered to aid the public, as the predictions upon which they are based are only made for easterly or westerly winds.

(1400. 10/90. 1090) F. O. 431.

Harrison & Sons, Printers St Martins Lane W.C.

announcement of storm warnings were received in 1877, and later information has not been received relative to some of these systems of signals:—

Russia.—Drum and cone, with lamps for night signals.

Sweden.—Storm warnings not in use.

Norway.—In some places balls or flags. No official or uniform system. No night signals.

Denmark.—No storm warnings.

Holland.—The Æroklinoscope, for the direction and force of the expected wind. Sheets on which are noted the winds actually blowing, barometer heights, temperature, &c.

Belgium.—No storm warnings.

France.—Drum and cone. No night signals.

Austria.—No storm warnings.

Turkey.—By signals. The reports are exhibited in the harbour offices.

Mauritius.—Flags and ball, with lamp for night signals.

New South Wales.—Admiral FitzRoy's. No night signals.

Victoria.—None at present. The English system is to be adopted.

Warning Storm-Signals in use on the Coast of Portugal since August 1, 1888.

At all the semaphore stations the state of weather is communicated to passing vessels by the signals of the Commercial Code, which, being known to all mariners, is used in view of the fact that there is no International Code of Storm-signals. This system indicates the force of the wind, on a scale of one to six, and also its direction to eight points.

It is suggested from Portugal that the system of signals should be common for all coasts, and also very simple; that one flag should indicate the section of the coast predicted for, a second the direction of the wind, and a third flag or a triangle the force of the wind.

General Orders No. 29.

* * * * * *

III.—*Information Signal.*

In obedience to the wishes of a large number of vessel-owners, ship captains, and others interested in navigation, the Chief Signal Officer has adopted a signal known as the "Information Signal," and forming one of the system of "Storm, Cautionary, and Wind-direction Signals."

The "Information Signal" consists of a yellow pennant, of the same dimensions as the red and the white pennants (wind-direction signals), and when displayed indicates that the local observer has received information from the Central Office of a storm covering a limited area, dangerous only for vessels about to sail to certain points. The signal will serve as a notification to ship-masters that the necessary information will be given them upon application to the local observer. The use of this signal will begin the 1st December, 1889.

It is believed that the display of the "Information Signal" will, in many instances, obviate the necessity for the display of the "Cautionary Signal" (yellow flag with white centre).

Signal Office, War Department, Washington,
November 11, 1889.

Appendix (C).

Report on General Division IX.

Warnings of approaching Storms.

System of Storm Warnings used in the German Empire.

THE system of cautionary signals adopted in the German Empire is as follows:—

1. A ball means—caution.
2. A cone hoisted point down—Storm from S.W.
3. A cone hoisted point up—Storm from N.W.
4. Two cones hoisted points down—Storm from S.E.
5. Two cones hoisted points up—Storm from N.E.

One square flag hoisted, together with these shapes, means—that the wind will probably turn to the right—(N.E., S.W.); two flags, pointed in the same way, mean—that it will probably turn to the left—(N.W., S.E.).

Night signals are not in use.

Appendix (D).

Report on General Division IX.

Warnings of approaching Storms.

Opinions of Officers and others, submitted for the consideration of the Maritime Conference.

Report of Ensign George P. Blow, United States' Navy, in charge of Branch Hydrographic Office, New York City, on General Division IX.

"(*a.*) The transmission of warnings."

Warning of approaching storms should be immediately telegraphed to the seat of Government of each country or island over which the gale is expected to pass, or the shipping of which will be exposed to danger. As soon as this report is received, it should be turned over to the meteorologist for elaboration and correction. With a knowledge of the local action of such gales in the past, together with a careful consideration of the meteorological conditions then existing, a very accurate forecast of the weather may be made. This forecast or warning should then be telegraphed to all the seaboard cities, life-saving stations, light-houses, and, where possible, to the light-ships. (In the near future it is believed that all light-ships will be connected with the shore by submarine cables, which will make it possible to display these storm-signals.) Printed bulletins in English, French, German, Spanish, and Italian, giving a brief description of the approaching storm, should also be posted in all the Exchanges, Custom-houses, and other places where ship-masters are known to congregate.

Warning signals should be hoisted at each signal station, light-house, life-saving station, and light-ship within the threatened district.

"(*b.*) The uniformity of signals employed."

It is of great importance that the signals employed for this purpose be the same all over the world. The captain or mate of a foreign vessel may not be able to read the bulletins giving warning of an approaching storm, or may not be in a position to see it, but if an international system be adopted he will have ample warning from the signal station before leaving port. There are many systems of signals used in different countries for the purpose of giving timely warning of danger to the captain about to leave port, or coasting along the shore from light-house to light-house. Some of these depend upon the number and colour of flags, others upon the position of different shapes suspended from masts and yards, and others again upon the semaphore system. Flags are not suitable for the purpose, as they are only extended in a breeze, and are of no use in a calm. It is found to be impossible to distinguish colours in misty or foggy weather, or where the bunting is old and discoloured, even when the flags are extended to the full limit in a stiff breeze. Flags cannot be read even under favourable circumstances when the wind is blowing either towards or away from the observer. It is believed that the best results can be obtained from a modification of the semaphore system, and the following rough plan is respectfully suggested:—

The arm of the semaphore will be used to denote the direction from which the gale or storm may be expected, while the shapes suspended from the end of the arm will denote the relative force of the wind. These semaphores should be established at all signal stations, light-houses, and, where practicable, on every light-ship, and they should be as large as the surrounding conditions will admit. They should be painted such colours as can best be distinguished. At night the direction of the arm of the semaphore will be shown by three coloured lights, according to the amount of danger to be apprehended from the approaching storm.

Information Signal.

It sometimes happens that a severe storm is raging on some other part of the coast, but is not expected to pass over certain sections. It is very important that all vessels about to sail from ports in this section, however, should be warned of these gales. Thus, a cyclone in the Gulf of Mexico may not reach the northern ports of the United States, and storm-signals would not be displayed in Boston, but only along the Gulf Coast. It is essential that all vessels about to go south be warned of what is approaching. The "Information Signal" is displayed for this purpose at all signal stations where there are vessels likely to sail for the dangerous district. The "Information Signal" simply calls attention of ship-masters about to leave port that a severe gale is raging at some other place, and advises him to call at the station and obtain further information, read the weather bulletins and telegrams, and consult the Weather Bureau before sailing. To signal this information would necessitate such a complicated code as to make the whole system unintelligible. The "Information Signal" should be made with the semaphore arm unshipped or concealed, as it is not intended to give the direction of the wind, but simply to state that information can be obtained by calling at the Branch Hydrographic Office, or Signal Office. It is suggested that this signal be given by unshipping the semaphore arm and placing it across the semaphore frame by day, and by three white lights forming an equilateral triangle by night.

For moderate gale a cone is suspended from the semaphore's arm instead of the ball by day, and the two green lights mark the direction of the semaphore's arm instead of the two red lights by night.

Wm. C. Whittle, Captain, Bay Line Steamer "Georgia."

(*a.*) I think that much good would result from an interchange of opinions between passing vessels and when one vessel meets another. I think it would be well to communicate warnings of bad weather or assurances of good.

(*b.*) As no system of communicating could be intelligible without uniformity, all classes of information should be communicated under an International Code for such purpose.

The arrangement of such a Code should be made by a Conference of authorities on maritime matters, and international legislation obtained for its enforcement.

Report of D. T. Terrill, Ensign, United States' Navy (in charge of Branch Hydrographic Office, Portland), Oregon, concerning Opinions of seafaring men whom he has interviewed.

The Signal Service of the United States leaves but little to be desired in the way of improvement. Its flags convey accurately the information desired.

Stations showing warning flags should be established where all vessels could receive the latest information before putting to sea.

Extract from Letter written by Edw. Gittins, Secretary of the Mersey Docks and Harbour Board, August 26, 1889.

Storm warnings are received by telegrams from the Meteorological Office at London, and signals, consisting of a cone, are exhibited in a prominent position for the information of parties concerned in shipping. Copies of the telegrams are also posted in various public places.

Extract from "North Sea Pilot," Part IV, 4th Edition, 1887.

Weather Signals.—The following local signals have been adopted at the principal ports and shipping places on the coast of France, in addition to the established storm warnings :—

1. A flag, of any colour, indicates : weather doubtful, barometer inclined to fall.
2. A short pendant (cornet) indicates : appearance of bad weather, heavy sea, barometer falling.
3. A pendant indicates : appearance of better weather, barometer rising.
4. A ball above cornet indicates : the entrance of the port has become dangerous, be careful.
5. A ball below cornet indicates : the life-boat is coming out.

Weather Signals.—Signals, in connection with the telegraph station on the Skaw, are made at the masthead by means of a black cone and cylinder, and remain hoisted for 36 hours after the receipt of the despatch from the Meteorological Institution at Christiania ; they signalize great atmospheric disturbances that may threaten the neighbouring coasts in the North Sea and in the Baltic.

A cylinder over a cone with the point down : a gale threatened from the south.

A cylinder under a cone with the point up : a gale threatened from the north.

A cylinder alone : a gale, without indicating the direction.

Extract from "Baltic Pilot," 2nd Edition, 1888.

Storm warnings are regularly transmitted to the stations at Libau, Windau, Riga, Pernau, Baltic Port, Revel, Hangö, Helsingfors, and Kronstadt, from the Chief Observatory at St. Petersburgh. The signals are made with a cone and a drum When the cone is hoisted point downwards it indicates that strong winds may be expected from S.E. to N.W. by the south ; point upwards, that strong winds may be expected from N.W. to S.E. by the north. At night the storm warnings are signalled by three lanterns in the form of a triangle, with the point either up or down, corresponding with the day signals.

General Division X.

Reporting, marking, and removing Dangerous Wrecks or Obstructions to Navigation.

(*a.*) A uniform method of reporting and marking dangerous wrecks and derelicts.
(*b.*) The division of the labour, cost, and responsibility among the several maritime nations, either by geographical apportionment or otherwise—
Of the removal of dangerous derelicts;
And of searching for doubtful dangers with a view of removing them from the Charts.

The heading of this Division leaves it doubtful whether the Conference expect the Committee to consider measures dealing with dangerous wrecks and obstructions in territorial waters, as well as on the high seas.

The Committee are of opinion that it is not necessary or desirable to propose international action regarding territorial waters, except the marking of wrecks, which subject is treated under General Division XII.

(*a.*) *A uniform Method of reporting and marking Dangerous Wrecks and Derelicts.*

Wherever the word "wreck" is used in this Report, it is meant to designate "an abandoned vessel aground," and wherever the word "derelict" is used, it is meant to designate "a vessel afloat permanently abandoned."

Wrecks are not always to be considered a source of danger to navigation. When lying outside of the fairways, as for instance on dangerous sands, or on coral reefs, they may even contribute to the safety of navigation by becoming conspicuous day marks; but when they are lying in a fairway, in water of not sufficient depth to allow vessels to pass without striking the hull or spars of the wreck, they become a serious danger to navigation.

Derelicts are always a danger to navigation, as other vessels may run into them without any warning, particularly at night or during thick weather. Since the 1st January, 1889, five collisions with derelicts are known to have taken place in the North Atlantic Ocean alone, by one of which lives were imperilled. (See Appendix A.)

Undoubtedly the number of lives and the value of property lost through collision with derelicts at sea has been very considerable, and such losses might be greatly reduced if proper steps were taken to clear the seas of such dangers.

Other dangerous obstructions (icebergs, newly discovered shoals, reefs, &c.) would seem to be included under the heading of "General Division X," and although not alluded to in paragraph (*a*), should, in the opinion of the Committee, be discussed here, as they may constitute the most serious of all the dangers dealt with in this Division.

Reporting Dangerous Wrecks and Derelicts.

The danger caused by wrecks and derelicts might be considerably lessened if their exact position were known to the mariner. For obvious reasons it is often most difficult to attain this end completely. Much, however, would be gained if as accurate a report as possible were secured and brought to the notice of mariners without loss of time.

Regarding the manner in which such reports should be brought to the Central Office in charge of the distribution of "Notices to Mariners," the Committee propose the following Resolutions:—

1. That it is advisable to make it the duty of any of the officers or of the crew of a wreck or derelict to report, as soon as possible after landing, to the nearest harbour authority, if necessary through their Consul, as follows:—

(*a.*) Name of the vessel abandoned.
(*b.*) Her distinguishing number.
(*c.*) Name of her home port, port from which she sailed, and place of destination.
(*d.*) General description of vessel and her rig.
(*e.*) Place where abandoned (latitude and longitude as near as possible).

(*f.*) Weather and current experienced before leaving the vessel, and in case she was a derelict, the direction in which she would most likely drift.

(*g.*) Whether or not it is intended to take any steps toward her recovery.

2. That a similar report should be made to the same authorities by the master of any vessel sighting a wreck or derelict, and a suitable entry made in the ship's log.

3. Such reports should be published in "Notices to Mariners," the daily press, and, if necessary, by giving telegraphic information to the ports which it most concerns.

Reporting other Obstructions to Navigation, as Icebergs, newly discovered Shoals, Reefs, &c.

Regarding the manner in which such reports should be transmitted to the proper authorities, the Committee propose the following Resolution:—

4. That it is advisable to make it the duty of every commander or master of a vessel to report the fact that an iceberg or dangerous field-ice has been sighted, or a shoal, reef, or other obstruction has been discovered, to the harbour authorities or the Hydrographic Office of that country to which the port next reached belongs, giving a full description of the obstruction, and all facts that may lead to the determination of its position: for instance, the time elapsed since the last reliable astronomical observation, and the rate of the chronometer. If the obstruction be a shoal or reef, the depth of water actually obtained by sounding on it should be given. Also when land is in sight the position of any off-lying shoal or reef should be determined by compass bearings of fixed objects in view; the error of the compass being stated, with information as to how and when that error was observed. Angles should also be taken between such objects, and a drawing of the coast and the position of the observer be added.

Regarding the reporting of ice met with in the vicinity of the Newfoundland Banks by signal from a vessel to other vessels the Committee are aware that an "Ice Code" has been published by a private individual which, according to his own statement, is rather extensively used amongst the steamers employed in the regular trade between the port of New York and the ports of Northern Europe.

This Code seems to offer some advantages, but as there was no evidence before the Committee showing whether its use had been found to be beneficial or otherwise, they were unable to decide whether the introduction of this Code or a similar one could be recommended.

Marking Wrecks and Derelicts.

As it appears impracticable in most cases for the master and crew of a sunken vessel to mark the wreck in any effective manner, no such obligation should be imposed on them; and it would also be a great burden, aside from the peril of the undertaking, to compel a passing vessel to mark a derelict. Neither does it seem feasible that any National Government should assume such a duty; but so far as possible means should be employed by which derelicts may be recognized at first sight, and with this end in view, the Committee recommend the adoption of the following Resolution:—

5. That whenever practicable it shall be the duty of the crew before abandoning a vessel (*a*) to hoist some distinctive signal, as: BCF, "Abandoned by the crew," or CRTG, "Derelict," or a ball, shape, or other similar mark, where it can best be seen, and where it should not be mistaken for any other authorized signal; (*b*) to let go the sheets and halliards of such sails as are not furled.

Marking other Obstructions.

At present it seems impracticable to mark shoals, reefs, &c., whether they be well known or only newly discovered, with the exception of those lying near the coasts of countries having a maritime commerce, and we consider it unnecessary to press for their being marked in other localities where they can be readily avoided by the exercise of ordinary skill and the usual precautions known to navigators; for this reason the Committee have no proposition to submit to the Conference beyond the introduction, so far as possible, of a uniform system of buoyage.

(*b.*) *The division of the Labour, Cost, and Responsibility among the several Maritime Nations, either by Geographical Apportionment or otherwise, of the removal of Dangerous Derelicts; and of searching for doubtful Dangers with a view of removing them from the Charts.*

---

1. *Derelicts, &c., on the High Seas.*

A geographical apportionment of the waters of the globe amongst the different maritime nations, in order to divide the labour and cost of removing wrecks and derelicts, or searching for doubtful dangers, cannot be recommended for adoption.

In the open sea, with the exception of a part of the North Atlantic, derelicts and dangerous wrecks are exceedingly rare, and as these parts of the ocean are, comparatively speaking, not much frequented by vessels, the danger accruing from such obstructions is not one to warrant the expenditure of such sums of money as would be necessary to institute a regular service, sufficient to insure their removal from regions of such enormous extent. The news of having sighted a derelict is often a week or more old before it is received by the authorities; a rescuing steamer can often not be on the spot for another week; the position given is in many cases not accurate; and in most parts of the sea the drift of the derelict is exceedingly uncertain. It is, therefore, a most difficult task for a vessel sent out to search for a derelict to find it; and the expense incurred by such expeditions may often be out of all proportion to the small chance of finding and removing one.

The geographical apportionment of the waters of the oceans might, besides this, easily lead to the supposition that the limits so defined would circumscribe, moreover, the sphere of political interest of the respective Governments.

2. *Derelicts in the North Atlantic.*

In the North Atlantic, particularly in that part of it bordering the North American coast westward of a line drawn from the Bermuda Islands to Cape Race, Newfoundland, derelicts are so frequently met with that they must be considered a serious danger to navigation.

As in these waters the vessels whose safety is imperilled by their existence are exceedingly numerous, the number of persons on board of them very large, and the value of these ships and their cargoes very great, and as, moreover, the chances for locating derelicts, and for determining the direction of their drift, are particularly favourable, the Committee propose that the various Maritime Powers should come to some agreement respecting their removal.

In case this proposition should be entertained, it is submitted that the respective Powers should also come to some understanding regarding the proprietary rights which may still exist, whether in the ship or in her cargo.

Besides this, it seems desirable to point out that, amongst other matters that will necessarily have to be considered, it would be well to take steps to prevent the destruction of derelicts that might readily have been saved, and to make sure that, in case destruction has been decided upon, no evidence of crime should be destroyed also.

3. *Wrecks and Derelicts in Coast Waters.*

Regarding wrecks and derelicts in coast waters outside the territorial limits, the Committee submit that the duty of marking, and, if necessary, of removing wrecks, or such portions of them as obstruct navigation, has already been generally acknowledged by the Governments whom it concerns, and therefore no further propositions have to be made in this regard.

It has, however, been brought to the notice of the Committee that Governments who, by Treaty, have acknowledged the exterritoriality of subjects of other Powers and of their property, are sometimes very much hampered by the consideration of private interests in their action regarding the removal of wrecks, even when the value of the wreck and cargo is very small, and there is scarcely a possibility that salvage operations can be successfully undertaken. The Committee are therefore of opinion that a Resolution should be adopted to the following effect: That in such cases the Consul or Consuls concerned shall not have

he right of withholding his or their consent to the destruction of a wreck, or parts thereof, if it is shown that the wreck constitutes a danger to passing vessels, and if there is no apparent possibility that it will be removed within a reasonable time by the owners or by the Insurance Companies interested.

As to derelicts in coast waters, there seems to be little doubt but that private enterprise, in order to secure salvage, will prove sufficient to remove any of them. For this reason it would seem to be unnecessary that any proposition should be made which would interfere with the established custom.

There was, in the opinion of the Committee, some doubt regarding the meaning of the word "responsibility" used in this heading. They consider, however, that no Government would acknowledge any responsibility for the waters under discussion which had not been made the subject of some formal agreement entered into after negotiations by the usual diplomatic methods.

4. *Searching for doubtful Dangers with a view of removing them from the Chart.*

The greater part of these dangers have been entered on the Charts from the reports of single ships, and under the assumption that it is often better to do so rather than have the mariner entirely unwarned; though such reports may have appeared from the very first of doubtful accuracy. In order to make sure that these dangers do not exist, it has been conclusively shown by experience that it is not sufficient to sail across the alleged position, but that it is necessary, at the same time, to take extensive soundings to prove beyond a doubt that nowhere in the vicinity of the alleged danger anything but deep water is found, and that it is, therefore, justifiable to remove the danger from the Chart. This has become the acknowledged custom of the different Hydrographic Offices.

In order, therefore, to make such searches effectual, ships employed for this purpose should be fitted out with deep-sea sounding apparatus. Ordinary war-vessels are not usually supplied with such means, but only surveying vessels or vessels fitted out for scientific exploration. Such vessels will, as a matter of course, receive from their respective Governments instructions to search for dangers of this kind whenever they find them located in a position near which their special mission will take them. What is, however, most wanted, at present, are accurate surveys on coasts newly opened to trade and commercial enterprise, in order to detect dangers whose existence is entirely unsuspected. The number of these that are yearly discovered (ninety last year), many by the expensive process of losing a ship on them, proves incontestably how imperfect the surveys of the world are.

To divert ships engaged in such surveying work, to scour the ocean in order to verify doubtful reports under international engagements, would be to practically stop the production of improved surveys. Under these circumstances the Committee cannot recommend any action in the matter.

If masters of vessels, when seeing indications of shallow water, would act in accordance with the Resolution we have placed before the Conference, on p. 3,* instead of passing on their course without any examination, or even taking a cast of the lead, the number of these dangers reported as doubtful would be greatly lessened.

Resolutions regarding General Division X, submitted for the consideration of the Conference.

1. That it is advisable to make it the duty of any of the officers or of the crew of a wreck or derelict to report, as soon as possible after landing, to the nearest harbour authority, if necessary through their Consul, as follows :—

(*a.*) Name of the vessel abandoned.

(*b.*) Her distinguishing number.

(*c.*) Name of her home port, port from which she sailed, and place of destination.

(*d.*) General description of vessel and her rig.

(*e.*) Place where abandoned (latitude and longitude as near as possible).

(*f.*) Weather and current experienced before leaving the vessel, and, in case she was a derelict, the direction in which she would most likely drift.

(*g.*) Whether or not it is intended to take any steps toward her recovery.

* See p. 295

2. That a similar report should be made to the same authorities, by the master of any vessel sighting a wreck or derelict, and a suitable entry made in the ship's log.

3. That such reports should be published in "Notices to Mariners," the daily press, and, if necessary, by giving telegraphic information to the ports which it most concerns.

4. That it is advisable to make it the duty of every commander or master of a vessel to report the fact that an iceberg or dangerous field-ice has been sighted, or a shoal, reef, or other obstruction has been discovered, to the harbour authorities or the Hydrographic Office of that country to which the port next reached belongs, giving a full description of the obstruction, and all facts that may lead to the determination of its position; for instance, the time elapsed since the last reliable astronomical observation, and the rate of the chronometer. If the obstruction be a shoal or reef, the depth of water actually obtained by sounding on it should be given. Also when land is in sight the position of any off-lying shoal or reef should be determined by compass bearings of fixed objects in view; the error of the compass being stated, with information as to how and when that error was observed. Angles should also be taken between such objects, and a drawing of the coast and the position of the observer be added.

5. That whenever practicable it shall be the duty of the crew, before abandoning a vessel (*a*) to hoist some distinctive signal, as BCF, "Abandoned by the crew," or CRTG, "Derelict," or a ball, shape, or other similar mark, where it can best be seen, and where it should not be mistaken for any other authorized signal; (*b*) to let go the sheets and halliards of such sails as are not furled.

6. That the different Maritime Powers interested in the navigation of that portion of the North Atlantic Ocean bordering the American coast, and situated westward of a line drawn from the Bermuda Islands to Cape Race, Newfoundland, be invited to come to an agreement respecting the removal of derelicts in these waters under due official supervision.

7. That in countries which, by Treaty, have acknowledged the exterritoriality of subjects of other Powers and their property, the Consul or Consuls concerned shall be instructed not to withhold his or their consent to the destruction of a wreck, or parts thereof, if it is shown that the wreck constitutes a danger to passing vessels, and if there is no apparent possibility that it will be removed within a reasonable time by the owners or the Insurance Companies interested.

Appendix (A).

Report on General Division X.

Reporting, marking, and removing Dangerous Wrecks or Obstructions to Navigation.

Report of Ensign George P. Blow, United States' Navy, in charge of Branch Hydrographic Office, New York City, on General Division X.

"(*a.*) A uniform method of reporting and marking dangerous wrecks and derelicts."

An International Telegraphic Exchange should be established for this purpose. The position of every dangerous wreck or derelict should be reported by telegraph to the Government of each of the maritime nations as soon as received. Every Government should immediately telegraph this information to each of its seaport cities, together with such additional information as may be necessary. In the case of "wrecks," it should be the duty of the Government within whose jurisdiction the wreck is located to properly mark it, and to immediately notify the other Governments by telegraph that such has been done. The marks employed for this purpose should be "wreck-buoys" or "watch-vessels." These marks should be kept in position until the wreck has been removed or destroyed, or has ceased to be a danger to navigation. When this is the case, telegraphic notice of the removal of the mark should be given. If possible, due notice of the removal of any "wreck-buoy," or "watch-vessel" shall be given in advance. Wreck-buoys should be painted green and should carry a cage of the same colour made in the shape of a cube. The name of the wreck should be plainly marked on the buoy or "watch-vessel." The buoy should be a lighted one, if possible, and should show two green lights. The "watch-vessel" should be painted green, with the name of the wreck plainly marked on each side in white. By daytime two green cubes should be hoisted, one above the other, and by night two green lights should be shown in the same position.

It would be impossible to mark derelicts unless they should be on soundings and could be anchored. The only thing that can be done is to warn mariners of their probable position, and offer inducements to passing vessels to destroy them or bring them into port.

"(*b.*) The division of labour, cost, and responsibility among the several maritime nations, either by geographical apportionment or otherwise."

"(*b*, 1.) Of the removal of dangerous derelicts."

It is the manifest duty of each nation to police its own waters and to keep them free from derelicts, wrecks, or other obstructions. The policing of the high seas becomes much more complicated and difficult. An attempt to apportion certain areas to each nation would meet with great opposition and innumerable complications, except in waters like the North Atlantic. In the latter case, where the great bulk of the commerce of the world is concentrated, the immediate coasts are occupied by a few powerful civilized Maritime Powers, both capable and willing to assist in clearing the ocean of dangers. Along the African coasts, or among the islands of the Pacific, however, it would be impossible to carry out such an apportionment.

According to almost universal custom and law, if a vehicle breaks down in the street or road, it is the duty of its owner to remove it at once, so as not to obstruct the highway. A derelict vessel occupies the same position as an abandoned carriage in a road; often valueless to its owner, but a source of constant danger to others. It should be the duty of the Government whose flag the vessel flies to send out, and either bring her into port or destroy her. As above stated, the North Atlantic can, with great ease, be divided into certain areas, and each section can be policed by one of the Great Powers. This action is earnestly advocated. But for the other oceans this idea is not deemed practicable. Some inducement should be given to vessels to bring derelicts into port or destroy them. Time is valuable to seamen as well as to those on shore, and a liberal allowance should be paid for the destruction of one of these floating wrecks. In case of a vessel floating bottom up, only a short time is required to pierce her bottom and sink her, but a timber-laden vessel would require torpedoes or dynamite to break her up.

It is suggested that a liberal sum be paid the captain and crew of any vessel who destroy a derelict. Proof of the actual destruction of the wreck would, of course, be required before payment. This sum should be paid by the Government under whose flag the derelict originally sailed. It is believed that if such an inducement should be offered many vessels would destroy derelicts, and thus greatly reduce the danger of navigation.

A still further inducement should also be offered by decreeing that the salvage on an abandoned vessel (after a certain limit of time) be the total value of the vessel and cargo. This would pay a steamer for towing a derelict into port.

"(*b*, 2.) Or of searching for doubtful dangers with a view of removing them from the charts."

With the exception of the North Atlantic Ocean any geographical apportionment would be impossible, as above stated; and the number of doubtful dangers in the Atlantic is so small that there is really little need for such an apportionment. Probably the best and simplest way of accomplishing the desired object would be for an International Agreement to be made between all the Maritime Powers for the continuous prosecution of this work. Each Government should pledge itself to employ one or more properly equipped vessels in this work, and to give the other Powers full reports of the results obtained from time to time. The number of vessels employed should depend upon the amount of commerce, and be in direct proportion to the foreign trade of the nation. No attempt should be made to coerce any Power into investigating certain sections, as it is believed that the country most interested should make the investigations, and each should be free to choose its own field of operations. These vessels would, of course, be required to search for and destroy wrecks or derelicts in the vicinity of their working grounds; or, when so ordered, to cruize specially for these dangers and remove them.

It is believed that such an agreement will be much more readily made and kept than one depending upon geographical apportionment, and that better results will follow its adoption.

Report submitted by the United States' Hydrographic Office on General Division X.

(*a.*) As regards aids to navigation, a uniform method of reporting and marking dangers is absolutely necessary; much trouble has been experienced in this Division because no system prevailed; time, labour, and confusion would be saved if a uniform method would be adopted and adhered to.

(The bearings should be given from seaward, or towards the object, as the mariner sees it. Whether true or magnetic, the variation used should be stated.)

(*b.*) A uniform method of spelling geographical names, based upon the spelling adopted by the nation to which the place belongs, leaving the pronunciation out of consideration, except in those languages where it becomes necessary by reason of the characters used to represent sounds (Chinese and Japanese), should be adopted.

The maritime community would be benefited greatly by the use of a universal geographical dictionary, in which the spelling of names would be universal, the pronunciation to be in parentheses, according to the usage of the principal nations interested.

A uniform system of reporting the characteristics of lights should be adopted, and the visibility should be upon a basis common to all nations. As to the former, the words "intermittent" and "occulting" are cases in point. There is no proper distinction between the two; the word "occulting" is doubtful to some, and "intermittent" is preferable. In our light lists it includes the term "occulting."

As to the visibility, the elevation of the focal plane of the light above high-water level is given, and the distance of the sea horizon due to that elevation, or the distance it may be seen from the deck of an ordinary vessel. With us 15 feet is used; the English, 14 feet; the Italians, 18 feet; the French, 4½ metres (about 15 feet), and so on.

Every nation should have attached to its Hydrographic Service small vessels especially fitted for and adapted to blowing-up or otherwise destroying dangerous derelicts. Reports of the existence of these dangers to navigation should be regularly made, as they are to the Division of Marine Meteorology of this office, and their location and general drift shown upon some such publication as our own Pilot-Chart, whence they could be easily followed and destroyed.

Searching for doubtful Dangers. — These "doubtful dangers" have always been a bugbear to navigators, especially in the Pacific Ocean, owing to contradictory reports as to position and conflicting evidence as to their existence.

In the original Reports, the chief trouble lay with the disagreement of the Dutch Charts with those of other nations, but latterly they have adopted the same longitude as the British Admiralty.

Duplication and discrepancies doubtless arose in the position of these dangers, depending upon the authority used. Since the telegraphic determinations of longitude, in 1881-82, in the East Indies, China, and Japan, discrepancies in the positions of actually existing dangers should not occur.

If a plan could be agreed upon whereby the Pacific could be divided into districts, and apportioned among the various Naval Powers represented at the Conference, and a thorough survey of such allotted positions be made by each, this question could be definitely settled, a source of doubt removed, and a feeling of security obtained in the navigation of these waters. The division of labour, cost, and responsibility could be easily arranged. In spite of the fact that the Atlantic Ocean is so well surveyed, many doubtful dangers exist there as well, and this service should be so extended as to include all the waters of the globe.

Very respectfully,
(Signed) CHAS. M. McCARTENEY,
Lieutenant, United States' Navy.

I propose that each nation shall keep clear of wrecks and other obstructions to navigation her own shores and the shores of her dependencies out to the 100-fathom line; and that the work of investigating reported dangers and removing wrecks and derelicts on the high seas of the world, outside of this line, be assigned to contractors by oceans, and be paid for by all the nations carrying on trade upon such ocean in combined proportion to the tonnage afloat and to the commerce carried on in importation and exportation.

A proposed geographical apportionment is also submitted. In this the principle is supposed to hold good that each maritime nation is bound to remove all wrecks and derelicts which are dangerous to navigation, and also to verify or disprove the existence of any doubtful dangers reported in the past or future whenever such wrecks, dangers, or derelicts are situated within miles of its main coasts, or a like distance from any of its off-lying islands. Outside of this mile limit, the ocean, according to this scheme, is to be regarded as international region, and on the Map the districts have been allotted by taking into account the resources of the respective Governments and their facilities for reaching the allotted region from the home or the colonial stations.

The inner, or mile, limit has not been indicated generally on the Map, as it is supposed to apply equally to all coasts and islands, except in cases where the nation or Government controlling a coast is known to be without a navy, and without sufficient resources to do the work efficiently. In such a case the Government to which the district contiguous to the mile limit is assigned is to do the work on such conditions as may be satisfactorily arranged between the two Governments involved.

It is not claimed that the details of such a plan are here presented; the object has been to present the apportionment in general form, so that it may be available as a basis for the discussion of such a plan.

Very respectfully,
(Signed) G. W. LITTLEHALES.

Opinion of Wm. C. Whittle, Captain, Bay Line Steamer "Georgia."

(*a.*) A uniform method of reporting wrecks and derelicts.

As all maritime legislation should have for its object the removal of dangers, everything tending to secure that end should be done.

All vessels, on arriving in port, should report the position of any source of danger, and, as far as possible, its condition.

In case of a derelict, any vessel removing or destroying (if not worth saving) such a source of danger should be remunerated for it.

In the urgency for expedition in trade, it would be unreasonable to expect, unfair to require, and impossible to enforce upon any trader the delay and expense, solely *pro bono publico*, the work that action in this matter would necessitate.

It should be required of the merchant-vessel to report obstructions of any character, and the duty of taking further action should devolve on the Government in such a way, and under such a system, as their concerted wisdom should determine.

(*b.*) It is not an easy matter to determine an equitable system among maritime nations as to expense, responsibility, and labour of searching for, locating, or removing derelicts or dangerous obstructions, but it would seem but just that all such expense, &c., no matter by whom incurred, should fall on the nation in the service of whose citizens the derelict was employed. A fund to meet such obligation should be provided by law, and expended under direction of a legally established authority.

A coastguard of Government vessels for searching out such derelicts, and taking action upon their being reported, should, in my judgment, be established, and a system of telegraphing such reports, with position, &c., to the nearest port to the locality of the obstruction, should be arranged for.

Extract from Letter written by Edw. Gittins, Secretary of the Mersey Docks and Harbour Board.

Information as to wrecks within the port of Liverpool is at once given to the Pilotage Office in this city, and by telegrams to the outlying pilot stations.

A wreck is denoted by a watch-vessel and a wreck-buoy, both painted green, with the word "Wreck" marked thereon in white letters. Owing to the narrow tidal waters of the river and the approaches thereto, these are stationed in the tidal line of a wreck.

Provision is made in the Rules hereinbefore referred to with regard to the signals to be displayed by vessels marking the position of wrecks.

Obstructions to the navigation of the port of Liverpool are dealt with by the Mersey Board under the powers conferred upon them by section 11 of "The Mersey Docks Act, 1874."

Under an Act which has just been obtained by the Mersey Board, the Marine Surveyor is required to certify that, in his judgment, a wreck is an obstruction to the safe and convenient navigation and use of the port, before the wreck can be dealt with by the Board.

Report of D. T. Terrill, Ensign, United States' Navy, in charge of Branch Hydrographic Office, Portland, Oregon, concerning Opinion of seafaring men whom he has interviewed.

The reporting system of the United States' Hydrographic Office gives universal satisfaction. Every master should be required to report position of all wrecks sighted by him to the Consul of his Government in foreign ports, and to the nearest Hydrographic Office in home ports.

Each naval squadron should have a vessel specially fitted to destroy obstructions to navigation.

(*b.*) No suggestions made.

Lists of Collisions of Vessels with Derelicts in the North Atlantic since January 1889.

1. *April* 20, 1889.—Lat. 38° 10′ N., long. 66° 30′ W., British steam-ship "Cuban" ran into a water-logged vessel. Had one plate bent by the blow; cut into the derelict about 13 feet.

2. *June* 28.—American schooner "John S. Davis," in lat. 34° 42′ N., long. 64° 18′ W., collided with a large three-masted vessel. The "John S. Davis" rebounded after collision and passed within 5 feet of her. In the morning found a small piece of spruce-pine stuck in the bows.

3. Schooner "W. B. Herrick," of Boston, with cargo of oak staves, from Portland, for Cardenas, Cuba, struck a derelict at 4 A.M. on the 29th January, 365 miles W.N.W. of Bermuda, apparently the wreck of a three-masted schooner, with mainmast and mizenmast gone and foremast standing. It was blowing hard from N.N.W. at the time, and the schooner was running under a two-reefed mainsail only, in a high sea, when she struck the derelict bow on, shaking the vessel from stem to stern. After pushing the obstruction away, 2 feet of water in the hold were discovered, with the water rapidly increasing against the continued pumping of captain and crew, the vessel soon water-logged and filled the cabin, galley, and forecastle, and the heavy seas continually washing over the decks, so that only the after-house was left dry, on which the captain's wife, a few stores, and the boat's gear were placed. On the 1st February, at about 4 A.M., made signal to a passing steamer, supposed to be the steam-ship "Orinoco," for New York, which lay by the schooner for some time in the dark, but later on became separated. No other vessel sighted. The island was made on the evening of the 2nd instant, and the schooner towed into anchoring on the 3rd, all on board completely exhausted, having lived on such canned goods as available, and on some brackish water. The provisions and water had been lost; the deck-load and everything about the deck having been sacrificed in the first endeavours to keep the ship afloat.—"Bermuda Royal Gazette," 5th February, 1889.

4. *October* 15.—British schooner "Forest Fairy," in lat. 40° 59′ N., long. 33° 40′ W., struck and passed over a submerged wreck, doing considerable damage.

5. *December* 16.—Schooner "Cornelius Hargraves" collided with a capsized vessel near Cape Henry. Put into Norfolk and discharged some of her cargo of coal. Not much damage done.

Extract from "Memorandum prepared by the Committee of the Second Northern Maritime Conference." Copenhagen.

International Agreements for preventing the Dangers of Floating Wrecks.

The discussion mentioned in the introduction, p. 2, on the question: "What can be done to diminish the danger which threatens the navigation by floating wrecks?" led to the result that the following Resolution was passed:—

"That the Committee of the Conference should recommend to the Governments of the Northern States the issuing of instructions to their men-of-war similar to an order issued by the British Board of Admiralty, which runs thus:

"'Should any of Her Majesty's ships fall in with any water-logged vessel abandoned at sea, and constituting a danger to navigation, the same should be examined, and unless it appears that the cargo is composed of such large balks of timber as to be of themselves a danger if released to float, or unless the position of the wreck is such as to make it probable that she may be presently towed into port, every effort should be made to sink or otherwise destroy her; and that this Resolution should be brought to the knowledge of the Maritime Congress which is to be held in Washington in April 1889.'"

In doing this the Committee think it advisable to add the following main points of the said discussion:—

"The desirability of the introduction of an international agreement whereby the above-named British arrangement could be universally adopted, was shown, by statistical data extracted from the excellent and most useful "Pilot Charts of the North Atlantic Ocean," published monthly at the United States' Hydrographic Office, and which are sent, free of charge, to mariners on application to the Hydrographer at Washington.

The yearly increasing number of reported floating wrecks seems to be quite astonishing, viz.: in 1884 the number was 162; in 1885, 176; in 1886, 215; but in 1887 the number amounted to 305. It is evident that such numbers of derelicts constitute a most dangerous obstruction to the navigation; the more so as the longevity of some derelicts has been proved to be almost incredible; for instance, a schooner, "Twenty-one Friends," which was abandoned in March 1885 has been reported twenty-two times, the last time in December same year; the drift of this derelict in eight months ten days has exceeded a distance of 3,500 miles. Another derelict, the Italian barque "Vicenza Pirota," which was abandoned in September 1887, has been reported eleven times, the last time at the end of April 1888, having thus drifted upwards of seven months, and was then apparently in a good condition, and being directly in the track of commerce, it is probable that she will continue to be reported for a long time. To the dangers derived from derelicts must now be added the drifting logs of the great Canadian timber raft, dense masses of which are still to be met with in the Gulf Stream. This timber raft, which was lost in December 1887 on a voyage from Nova Scotia to New York, consisted of about 27,000 logs from 30 to 100 feet lengths, chained together in the form of a cigar. This sea monster had a length of 560 feet, breadth 65 feet, depth 38 feet, draught of water 19 feet, weight about 1,100 tons. According to the latest reports, parts of it have drifted in five months at a distance of about 1,560 miles. From an international standpoint, it is rather startling to see that nothing can be done to prevent a single individual from sending to sea, for the sake of gain, such an unseaworthy monster, which for a long time will make the navigation of the whole North Atlantic Ocean unsafe to the ships of all nations.

In connection with these remarks there was, naturally enough, given some statistical data, extracted from the monthly lists of shipwrecks, &c., published by the "Bureau Veritas." It was hereby shown that from 1884 till the end of 1887—that is, in four years—176 sailing-ships and 23 steamers had totally disappeared in the North Atlantic Ocean. There must certainly be a great probability for the supposition that many of these ships, whose fate ever will be unknown, have been lost by collision with floating wrecks, as it appears from the remarks in the "Pilot Charts" that not a few cases of collision have occurred from contact with abandoned water-logged timber-ships, after which, for instance, four of the ships were abandoned in a sinking state, though the crew was saved.

At the Conference in 1887 held in London by the Association for the Reform and Codification of the Law of Nations, a question intimately connected with this matter was treated in a very interesting manner by Rear-Admiral Colomb, viz.: "Under what circumstances is it justifiable to destroy shipping property at sea?" and where the following Resolution in this respect was adopted:—

"That in the opinion of the Conference derelict private property at sea ought only to be destroyed where there is an evident danger to navigation and the vessel is unlikely to be salved."

From the examples cited, it seems that the best manner to destroy a derelict is by blowing her up, as the burning of such wrecks, particularly when they are water-logged timber-ships, often has failed.

In the said "Pilot Charts" are also for every month laid down special "Transatlantic Steam-ship Routes" for eastward- and westward-bound steamers. The hope expressed on p. 11, that the plan as to "Ocean Lane Routes," originally proposed by the world-renowned American scientific navigator, Lieutenant Maury, will have the support of the honourable Congress, seems, therefore, to have got the very best basis.

Finally, the Committee of the Second Northern Maritime Conference avail themselves of this opportunity to conclude this Memorandum with an expression of their sincere thanks to the Government of the United States for the benefit bestowed to the navigation of the North Atlantic Ocean by the publishing in the said liberal manner of the above-named invaluable "Pilot Charts."

Copenhagen, September 1888.

General Division XI.

Notice of Dangers to Navigation.

Notice of Changes in Lights, Buoys, and other Day and Night Marks.

(*a.*) A uniform method of taking bearings, of designating them (whether true or magnetic), and of reporting them.

(*b.*) A uniform method of reporting, indicating, and exchanging information by the several maritime nations—to include the form of "Notices to Mariners."

(*c.*) A uniform method of distributing this information.

All notices of changes in lights, beacons, buoys, and other day and night marks, require not only to be brought to the notice of the public of that country in whose waters these changes have taken place, but also to all other maritime nations, so that the authorities may be enabled to impart information for the benefit of their own seafaring population.

This is usually done by publications to which the generic title of "Notices to Mariners" has been applied. They are either issued whenever occasion demands it, or at regular intervals, with an extra edition when necessary.

They may further be divided into (*a*) those published by the Department of Naval Affairs of the different countries, or, under its direction, by the Hydrographer; (*b*) those published by the authorities, central, provincial, colonial, or local, in charge of the light-houses, beacons, and buoys.

The publications mentioned under (*a*) are intended for the use of the mariner only, and the Committee do not consider it advisable to insist on any change regarding form or arrangement of "Notices to Mariners."

What has been said regarding the publications mentioned under (*a*) is true as well regarding those mentioned under (*b*). These "Notices to Mariners" are mainly intended for internal and local use in each country, and supply information not to mariners only, but to local officials, such as light-house keepers, inspectors of buoys, and others; and, considering that they are published for very different objects, and to be used by men of very different classes and occupations, the Committee do not consider it feasible to insist upon uniformity in matters of detail.

(*a.*) *A uniform Method of taking Bearings, of designating them (whether true or magnetic), and of reporting them.*

Taking Bearings.—In all countries, as far as we know, except Italy and Norway, the custom prevails that all bearings in "Notices to Mariners," and in "Light Lists," in order to locate a danger or to determine the limits of a light-sector, are given from seaward, that is, from the danger indicated toward the fixed objects by which its position is determined, or from the outer limit of visibility of a light towards the light-house.

This mode of taking bearings has the advantage that it is in agreement with the mode in which they are used by the mariner, and the Committee recommend that the Resolution in this behalf appended to their Report be adopted by the Conference with a view to this custom being made universal.

Designating Bearings, whether true or magnetic.—The adoption of a uniform method of designating bearings, whether true or magnetic, offers the advantage that bearings given in the publications of any country can be transferred *verbatim* to similar publications issued in any other country without the necessity for any alteration or calculation. This is of importance in preparing publications the value of which depends in no small degree on the possibility of issuing them immediately after any changes have been made which require to be notified to mariners.

All the evidence, however, which has been laid before your Committee tends unmistakably to the conclusion that it would be inexpedient for any country suddenly to adopt a new system of designating bearings in the place of one which has been sanctioned

by the custom of many years, and has become an essential part of the system of navigation generally adopted and taught in the nautical schools of the various countries.

It has also to be borne in mind that such a change concerns not only experts and scientific men who can easily understand and adapt a new system to their requirements, but, in the vast majority of cases, it would affect seamen whose knowledge of matters regarding navigation is inseparably connected with the methods with which they have been familiar all their lives, and to whom any change of the kind indicated would be confusing and dangerous.

For these reasons the Committee do not propose the adoption of a uniform method of designating bearings by giving them either true or magnetic.

Uniformity might have been attained in another way, *i.e.*, by giving bearings both true and magnetic. It was shown, however, that the advantages of such a plan would be more than counterbalanced by a large increase in the bulk of the text, and by the possibility of errors amongst seafaring men unaccustomed to any but a single system, and who might mistake one set of bearings for another when read in a hurry.

Having regard to these difficulties, the Committee do not propose to advise any action in this matter in the direction of uniformity beyond recommending that in all "Notices to Mariners" and "Light Lists" intended for exchange with other nations, whenever true or magnetic bearings are given, the variation shall be inserted.

Bearings to be given in Degrees, or in Points and fractions thereof.—It seems that in the majority of maritime nations the custom prevails that all bearings are given in degrees. This has the advantage that if the variation, which is always expressed in degrees, has to be applied in order that the bearings be entered on a chart, or when the variation has to be corrected for time elapsed since the date when it was determined, the result is more accurate than if the bearings were expressed in points.

On the other hand, it has to be borne in mind that the "Notices to Mariners" and "Light Lists" which are most universally used retain the custom of giving bearings in points and fractions thereof.

After a full discussion of this large and intricate question, the Committee decided to adopt the following Resolution:—

That the bearings for cuts of different coloured sectors of lights, or of bearings of lights defining a narrow channel, should be expressed in degrees where practicable.

Counting the Degrees.—The custom adopted universally in geodesy is that of counting the degrees, from the north to the right (or with the sun), beginning with 0 to 360 degrees. In one country the steering compasses are also so marked; and directions with reference to the course of the vessel are so expressed. This method offers certain advantages, but it is contrary to the custom of the large majority of mariners, and on this account the Committee propose that the number of degrees used in designating bearings should be counted from north and south to east and west, beginning with 0 and ending with 90 degrees.

North and south are universally designated by the letters N. and S. But east is in some countries designated by the letter O, and west in others also by the same letter—O. In order to make these designations uniform the Committee propose that all countries adopt, for use in the publications under consideration, the letter E. to designate east and the letter W. to designate west, in uniformity with the Rules adopted already for publications of Meteorological Offices.

Designating Distances.—The Committee advises that—

Distances should be expressed in nautical miles and fractions thereof.

The word "cable" should mean a tenth part of a nautical mile.

(*b.*) *A uniform Method of reporting, indicating, and exchanging Information by the several Maritime Nations, to include the Form of Notices to Mariners.*

1. *Reporting Dangers to Navigation, Change of Lights, &c.*

Reports of dangers discovered should be made as promptly and accurately as possible, and should be addressed to the proper authorities. This has been pointed out already in the Committee Report upon General Division X.

2. *Indicating Dangers, Changes of Lights, &c.*

(*a.*) Several countries refer the longitude given in the publications under consideration to a prime meridian, whose difference from the meridians of Greenwich or Paris, on

which most charts in use by mariners are constructed, may be unknown to a sailor. In such a case, though he may have become acquainted with the fact of the discovery of a danger, the establishment of a light-house, &c., he may be unable to enter such information, with sufficient correctness, on his chart.

The Committee, therefore, propose that in all notices which refer to any other prime meridian but that of Greenwich or of Paris the difference in longitude between such meridians should be inserted.

(*b.*) The visibility of a light is given in different ways. In some countries the number of miles given refer to the visibility of light in clear weather or in ordinary weather; in others, the visibility refers to a mean state of the atmosphere, *i.e.*, one which may be expected at that particular locality in 50 cases out of 100. The Committee had not sufficient evidence before them to decide as to the advantages of the two plans for general adoption; they, however, consider it desirable to bring the subject before the Conference in order that the attention of the different Maritime Powers should be called to it.

(*c.*) In some "Light Lists" the geographical range of a light is given, *i.e.*, the distance resulting from the height of a light above high water, in connection with the curvature of the earth, together with or without the additional distance calculated for an observer supposed to be elevated above the sea at a certain height; in other "Light Lists" the actual visibility of a light is given without any regard to the height of the light or the elevation of the observer; in some publications the lesser of the two distances is given, and in other cases both together.

Each of these methods offers some advantage, and it seems inexpedient, at the present moment, to propose uniformity in this respect.

It appears advisable, however, to adopt a standard height for the observer wherever the geographical range of a light is given in "Light Lists" or in "Notices."

The Committee therefore propose that the height of 5 metres be generally adopted in all countries where the metric system is in use, and that in other countries, where this is not the case, the height taken should be 15 feet of the measure of the country. This height seems to the Committee the best suited to the present requirements of navigation. The difference between these measures is of no practical importance.

(*d.*) The lights of light-houses are classified at present in "Orders," according to the size of the lantern, or, if dioptric, according to the diameter of the apparatus, though, in this respect, there exists considerable difference.

Since the introduction of the electric lights this classification has become inaccurate, and from a seaman's point of view misleading, for under its rules a 3rd order electric light generally is much more powerful than a 1st order oil or gas light. Uniformity in this respect is desirable, and the Committee therefore propose that the several Maritime Powers interested should be requested to consider the question in order to establish, if possible, a uniform classification of lights on the basis of the power of the light as seen by the mariner. At the same time it would be desirable to bring about a uniform classification as regards their character.

3. *Exchanging Information by the several Maritime Nations.*

It has become the custom for the Hydrographic Offices of the different maritime countries, with few exceptions, to ask for any information regarding their publications ("Notices to Mariners," "Light Lists," "Charts," "Sailing Directions") by direct application to the Hydrographic Offices of other countries, and to give such information in the same way.

It is not easy to see how this information could be so speedily and conveniently given in any other way. But the Committee are not aware that this usage has ever been sanctioned by the proper authorities. They have on this account thought it well to call the attention of the Conference to this fact, and they submit that permission to exchange information regarding these publications direct, without the intervention of the Foreign Offices, should be granted to all Central Hydrographic Offices in the home countries as well as those in the provinces, Colonies, and dominions, and also to those Central Offices which administer the light-houses, beacons, and buoys of a country, and which publish such information. A list of the offices referred to in this paragraph, which are known to the Committee, will be found in Appendix (B).

Some Maritime Powers are without any special Hydrographic Department. In such cases it would be well to designate some other office, for instance that of Harbour-master of their principal ports, who could be addressed if occasion occurs.

In some countries the "Notices to Mariners" are published only in newspapers.

It would be well if such Notices were sent to the different Hydrographic Offices of the world.

Contemplated changes in lights and buoys should be brought to public notice, if convenient, before the date on which such change is proposed to be made.

(*c.*) *A uniform Method of distributing this Information.*

The information contained in "Notices to Mariners" is now brought to the knowledge of the seafaring population by sending copies of the same to the different shipping offices and Consulates, and to Captains of the navy, and to masters of the merchant fleet. The Committee have no evidence before them which points to the fact that the measures taken by each country do not fully satisfy the requirements of those interested.

Resolutions proposed to the Maritime Conference regarding General Division XI.

In recapitulation, the Committee recommend the Conference to invite the several Maritime Powers to consider the following Resolutions with a view to establishing uniformity in the subjects treated in "Notices to Mariners" and "Light Lists":—

1. That all bearings should be given from seaward.
2. That the bearings of cuts of different coloured sectors of lights or bearings of lights defining a narrow channel should be expressed in degrees where practicable.
3. That all bearings expressed in degrees should count from north and south, from 0° to 90°, towards east and west.
4. That in designating bearings, the letter E. shall designate east, and the letter W. shall designate west.
5. That whenever bearings are given, the variation of the compass at the place should be stated.
6. That distances should be expressed in nautical miles and fractions thereof. The word "cable" should mean the tenth part of a nautical mile.
7. That whenever the longitude of a position is given, it should be stated which prime meridian is adopted, and, if other than that of Greenwich or Paris, the difference of longitude should also be stated.
8. That, in defining the visibility of a light, it should be stated whether the distance is for "clear" or "mean" state of the weather.
9. That where the geographical range of a light is given, it should be calculated as seen at high water from an observer 15 feet or 5 metres above the sea.
10. That a uniform classification of lights, based on luminous intensity and on the character as seen by the mariner, should be adopted.
11. That the Central Offices that issue "Notices to Mariners" or "Light Lists" should be permitted to correspond direct on such subjects.
12. That from countries where "Notices to Mariners" are published only in newspapers, copies of such papers should be sent to the various Hydrographic Offices.

Appendix (A).

REPORT ON GENERAL DIVISION XI.

Notice of Dangers to Navigation.

Report of Ensign George P. Blow, United States' Navy, in charge of Branch Hydrographic Office, New York City, on General Division XI.

"(*a.*) A uniform method of taking bearings, of designating them (whether true or magnetic), and of reporting them."

All bearings should be taken with an aledade placed directly over the compass, if possible. If not possible, however, the bearing should be carefully taken with respect to the ship's head, noting carefully the compass course at the same time, and, after being verified, should be referred to the compass.

All bearings should be magnetic, and should be given in degrees and minutes of arc from north or south around to east or west. Thus, N.N.W. would be N. 22° 30′ W. and S.W. by W.S. 56° 15′ W.

"(*b.*) A uniform method of reporting, indicating, and exchanging information by the several maritime nations, to include the form of "Notices to Mariners.'"

As previously stated, a Telegraphic Exchange should be established for the purpose of forwarding valuable information. Less important information could be sent by regular mail, as is now the case. The information thus received should be distributed according to its value and importance. Thus, storm warnings should be telegraphed to all the coast cities in the country, while notice of anticipated changes in lights would be given to the press and also issued in the regular way, as "Notices to Mariners."

The present form of "Notices to Mariners" issued by the United States' Hydrographic Office fills all the requirements and has given general satisfaction. It is to be regretted, however, that there are two kinds—one issued by the Coast Survey, and another by the Hydrographic Office—even in this country. For the sake of simplicity, economy, and uniformity, only one set should be published. If the "Notices to Mariners" of each country could be published in English, French, and German, their value would be greatly increased, as they could be read and understood by nearly all ship-masters.

"(*c.*) A uniform method of distributing this information."

Information received by the different Governments will be utilized in the way in which seems most desirable by the officials charged with that work. It is believed to be impossible to secure uniformity in this respect, although it is greatly to be desired.

Reports submitted by the United States' Hydrographic Office on General Division XI.

(*a.*) A uniform method of taking and reporting dangers should be used, as above stated. With us, and the French as well, the true bearing is used; it is the most economical, and, could dependence always be placed upon the accuracy of the observer reporting, it would be preferable.

But while to the educated navigator there should be no chance of wrong application of the variation, the generality of the merchant marine have a deep-rooted aversion to the use of true bearings.

The variation changes so slowly that the smallest change in the text of a Report or book of sailing directions as to courses and bearings would vary so little (less than $\frac{1}{8}$ point, or about 1°) that the best instruments used in modern navigation would hardly detect it in less than eight years in Great Britain and North-West Europe; fifteen years in the North Atlantic Ocean and the United States; twenty years in the South Atlantic Ocean; forty years in the Indian Ocean; and of fifty years in the Pacific Ocean (data obtained from Mr. Littlehales). Of course there are many arguments for and against the use of both; but I think that possible errors would be avoided by the use of the magnetic bearings.

(*b, c.*) The Consular Service would be of great value in reporting, indicating, and exchanging information. If regular Reports were made and forwarded to the various Hydrographic Offices by the Consuls in the seaport cities, much would be done towards the universal dissemination of nautical information. Ship-masters could obtain the printed Reports in the form of "Notices to Mariners" from the Maritime Exchanges, Boards of Trade, and such like institutions, as is done in our country through the medium of the branch Hydrographic Offices, which have done so much to spread this knowledge. It should be part of the Consular duty, not left to his volition, but compulsory, to send weekly Reports, which would be transferred to the Hydrographic Offices, and thence issued in the form of notices and extracts, of which, I think, our own system is an excellent illustration.

As to General Division XII (*a*) and (*b*), a uniform system in colour and numbering of buoys and beacons will be adopted, and it is practically almost generally agreed to and in use over the world, especially as to the main features common to all in marking channels, &c.

Very respectfully,

(Signed) CHAS. M. McCARTENEY,

Lieutenant, United States' Navy.

The mariner is principally concerned in making the land and in taking his departure from it, and in entering and leaving port. All lights, beacons, buoys, and land- and sea-marks are established as means to these ends.

In general, the directions for making use of these signals and guiding marks are arranged for approaching the land and entering port, and the reversing of them serves for departing. In conformity, then, with the methods of giving directions in general, it seems expedient that all bearings having reference to marks for navigation should be given from seaward. And as a further amplification of this uniform method, all bearings taken upon fixed objects for the purpose of locating wrecks, shoals, and the like should also be given from seaward, thus:—

Rock awash, Morro Castle, Havana, S. $\frac{3}{8}$ W., $6\frac{1}{4}$ miles.

Sunken wreck, Isle of Wight light-house, England, N.E., 10 miles.

The virtue of the use of the true bearing in nautical books and charts appears only when the subject is viewed from the stand-point of economy. But it is questionable whether economy can be successfully urged as an argument in its favour. As the direction of the magnetic meridian at a given place changes with the lapse of time, angular values of fixed directions referred to it must also change, and make corrections necessary in books and on charts where these directions are set down.

The expense and labour of making corrections on charts from this cause is inconsiderable, and, if the argument has any force, it must be with reference to books. It would be laborious and expensive to correct the bearings and courses in sailing directories by hand; and it is believed that the changing of these bearings would entail quite as much expense, if new editions of books were issued, through these changes in the text alone. If, however, the change which occurs in the direction of the magnetic meridian, and consequently in the value of a magnetic bearing or course, during the lifetime of an ordinary book of sailing directions is not sufficient to alter appreciably the reading of the text, then, as far as concerns nautical works, which are overhauled and reissued from period to period, the true and magnetic bearings stand upon the same footing with regard to the necessity for change. Let us suppose that, in a given book, the bearings all read to the nearest one-eighth point. The smallest change of which the text of this book could take account may be assumed to be somewhat less than one-eighth of a point, say one degree. This book could then be said to need change, as to the bearings and courses given in it, by an amount which the best instruments used in modern navigation could detect, at the end of eight years in Great Britain and North-Western Europe; of twelve years in the South Atlantic Ocean; of fifteen years in the North Atlantic Ocean; of twenty years in the West Indies; of forty years in the East Indies; and of fifty years in the Pacific Ocean.

The most rapid changes in magnetic bearings happen, at this secular period of the earth's magnetic state, to have their seat where there is the greatest activity in those changes of which nautical directories take cognizance; and it is probable that a volume of sailing directions embracing the British Isles would need extensive revision, amounting almost to a rewriting of the work, at the end of eight years, from the accumulation of necessary corrections not brought on by changes in the magnetic bearings.

All manuals on the deviation of the compass, and all graphical and mechanical methods of applying the deviation of the compass, at least in English literature upon this subject, proceed upon the assumption that the magnetic bearing or magnetic course is to be found, and not the true or astronomical, and, therefore, that it is the magnetic which is given in sailing directions.

Probably the most useful and most universally known graphical method of changing the distorted readings of a compass under the local influence of a ship's magnetism to a standard condition in which it is comparable with all other bearings is Napier's diagram, which is arranged solely for the conversion of compass into magnetic courses, and the reverse. Such graphical processes as this are arranged for safe and efficient usage amongst men possessed of a minimum of theoretical knowledge, to which class the great majority of seafaring men belong. While it may be an easy matter for such men as we find performing the duties of navigators in the navies of the world so far to generalize the method employed in Napier's diagram, or any other device, as to pass from compass to true course, and the reverse, by using the total error instead of the deviation alone, yet it is manifest that this is not to be expected of mariners in general.

Sailing directions and charts should conform to the ideas and methods advanced in standard nautical educational works.

Very respectfully,
(Signed) G. W. LITTLEHALES.

Opinion of Wm. C. Whittle, Captain, Bay Line Steamer "Georgia."

"Notice of changes in lights, buoys, and other day and night marks."

Whenever it shall be deemed expedient to change any of such marks, whose existence is known as a guide to navigators in coming into any port or on any coast from sea, a notice of such change should be given to an "International Maritime Commission" ninety days before such change is made, so that all foreign Boards of Trade can be notified and all vessels warned. A similar notice should be given to the Board of Trade in the country in which the contemplated change is made.

In the inland waters of any country, where any such change is contemplated, a notice of at least ——— days before such change is consummated should be given.

All foreign vessels should be required to take a pilot, and by that means avoid the dangers resulting from inland changes.

(*a.*) A uniform method of taking bearings, designating and reporting them.

It is to be accepted that every navigator knows the error of the compass by which he navigates, and it would greatly simplify the proper promulgation of the information if he would reduce all bearings taken to the true bearing, freed from magnetic deviation or error of his compass, so that any navigator or master receiving the report, and, in turn, knowing the error of his own compass, can reduce the reported bearings to his compass bearings and be guided thereby.

(*b.*) Under the International Code of Signals all vessels should be empowered and required to give any and all assistance to others in giving notice of dangers, changes, &c.

(*c.*) A uniform method of distributing information would be for all Boards of Trade, Light-house Departments, Coast Surveys, and Boards of Marine Inspectors to communicate with the "International Maritime Commission," upon whom the duty of cognizance and action should fall in any changes and causes of danger.

Opinions and Suggestions of various experienced Mariners obtained by Sergeant Paul Daniels, United States' Signal Service.

An international and uniform method of taking bearings, of designating and reporting dangers to navigation, changes in lights, buoys, and other day and night marks, also an international and uniform

method of reporting, indicating, and exchanging information by the several maritime nations, to include the form of "Notices to Mariners," as well as an international and uniform method of distributing this information, should be adopted. All bearings and their designation should be true and not magnetic.

Report of D. T. Terrill, Ensign, United States' Navy (in charge of Branch Hydrographic Office, Portland, Oregon), concerning Opinion of seafaring men whom he has interviewed.

(*a.*) Bearings should be given by vessels in points and eighths, magnetic, and by Government offices in degrees and minutes, true. Whenever points are used let magnetic bearings be understood, and where degrees are used let true bearings be referred to.

(*b.*) The United States' Hydrographic Office form of "Notices to Mariners" are all that could be desired, and give universal satisfaction.

(*c.*) Through Branch Hydrographic Offices is the only practicable method.

General Division XII.

A uniform System of Buoys and Beacons.

(*a.*) Uniformity in colour of buoys.

(*b.*) Uniformity in numbering of buoys.

Owing to the absence of a uniformity in buoyage, mariners, up to very recent times, seldom attempted to navigate a district by means of the buoyage unless they were specially well acquainted with the local system. But now that a certain degree of uniformity on a fundamental basis prevails, mariners in general are more induced to navigate their vessel, trusting to it and the chart of the district; it therefore becomes of greater importance that such uniformity should be extended as far as possible.

Two principal characters are used for distinguishing buoys and beacons, colour and shape.

The first object to be attained from an international point of view is uniformity. For that purpose colour is the best means, as applying to all systems of whatever kind, while the shape admits numerous exceptions. The colour is also applicable in all countries and with little expense, whereas the immediate adoption of shape would involve changes of several existing systems. Moreover, experience has proved that very many, if not the majority, of channels are now buoyed with sufficient distinctness without resorting to difference of form.

For these reasons, and while the opinion prevails that, at night and in thick weather, difference in form is a better means of distinction than difference of colour, your Committee advise that uniformity in colour should be adopted as a general rule, and that the use of shape should remain optional.

While, in the opinion of some members, the single colours of black and red are not so distinctive in contrast as a single colour used in connection with a parti-colour, experience gained in many buoyage districts, and particularly where used in conjunction with form, has proved that these dark colours are sufficiently distinctive for the safe navigation of districts where a more complicated system is not necessary. Single-coloured buoys are also more readily and cheaply repainted than parti-coloured buoys. We therefore recommend that the largely used red and black colours should be adopted generally for marking respectively the starboard and port sides of single channels.

Many districts, however, require a more complicated system of buoyage to identify the several neighbouring channels one from the other, such as the entrances of rivers with numerous channels like the Thames, the outlying shoals of the coast of the North Sea, the numerous shoals separated from each other by complicated channels such as in the Baltic Sea, &c.

In some of such districts a parti-coloured buoy is used with much advantage as a port-hand buoy. In a few—notably in England—a single black colour is used as a starboard-hand buoy. Inasmuch as a single black colour is in general use as a port-hand buoy in neighbouring districts visited by the same shipping, we suggest that the authorities of such countries should be invited to consider the great general advantages to shipping that would result from the adoption of uniformity in colour by discontinuing this dangerous custom of using a black colour to denote a starboard-hand as well as a port-hand buoy.

In some countries white is used as a distinctive colour, and with advantage when

contrasted with a dark background. As this practice cannot lead vessels into danger, we hesitate to advise that it should be compulsorily interfered with.

We are of opinion that where form is adopted the two shapes "Conical" and "Can" are appropriate for marking the starboard and port sides of a channel, a spar-buoy taking the place of the can in certain cases.

These forms are practically used in the United States, Germany, Canada, India, and Great Britain. But the various countries are not all in agreement as to which side of the channel is to be marked by a conical buoy and which by a can or spar-buoy.

It follows that one or more of the countries would necessarily have to rearrange their system, but, if the work were done gradually, the Committee believe that this could be performed at a minimum of expense in no way comparable with the great advantage that would result to navigation.

In connection with such a change of system we are informed that an extensive rearrangement in buoyage was recently carried out by Great Britain, the different shapes being changed from one side of the channels to the other side, the change being brought about without any casualty to navigation.

As regards top-marks, we recommend that those countries whose buoyage is based on colour alone should, whenever top-marks are used to denote sides of a channel, use conical or can-shaped marks on the existing buoys or beacons.

We are of opinion that the mode of distinguishing buoys from each other by names, numbers, or letters should be left to the decision of the various countries, but that all numbers and letters should be in consecutive order, commencing at the seaward end of the district.

The Committee are of opinion that districts where the buoyage is so complicated as to have led the authorities to adopt a compass system of marking, such as in the Baltic Sea, cannot, with a view to general uniformity, be coupled with the simpler systems found sufficient elsewhere; they therefore hesitate to recommend a fundamental change in such districts. But, after studying the "Sailing Directions" and the publication of Mr. S. A. Philipsen, Copenhagen, on "Beaconage and Buoyage of different Nations," which presents graphically the plans adopted by several nations, particularly those interested in the navigation of the Baltic Seas, the Committee find that the systems now in use, so far as colour and top-marks are concerned, are so similar that they recommend the Conference to suggest to the countries interested the desirability of the adoption of one uniform system, at least as regards colour.

The Committee understand that the following are the colours and top-marks at present in use in the various districts using the compass system to define the bearing of the mark or buoy from the danger it indicates:—

Marks on the *North* side of a shoal—

Norway .... } Black.
Sweden .... }

Russia .... }
Finland .... } White.
Denmark .. }

Marks on the *South* side of a shoal—

Norway ..... White.

Sweden .... }
Russia .... } Red.
Finland .... }
Denmark .. }

Marks on the *East* side of a shoal—

Norway ..... Black.
Sweden ..... Black, with a White horizontal band.
Russia ..... Red, with White horizontal bands.
Finland ..... Half Red and half White horizontal.
Denmark .... Red.

Marks on the *West* side of a shoal—

Norway .... } White.
Denmark .. }

Russia ..... White and Black horizontal bands
Finland ..... Half White and half Red horizontal.
Sweden ..... Red.

Marks on a *Middle ground*, with Fairway channels on either side—

Norway ..... Black and White horizontal bands.
Finland .... } Red and White horizontal bands.
Denmark .. }
Russia ..... Black.

Top-marks—

On Buoys or Marks on the *North* side of a shoal—

Norway ..... Brooms turned downwards.
Russia ..... Broom or Brooms not systematically arranged.
Finland ..... A Pole without a top-mark.
Sweden ..... A Ball.

On Buoys or Marks on the *South* side of a shoal—

Russia .... }
Finland .... }
Norway .... } Broom turned upwards.
Sweden .... }

On Buoys or Marks on the *East* side of a shoal—

Norway ..... Broom turned downwards.
Finland ..... A Pole without a top-mark.
Sweden ..... A Ball.
Russia ..... Two Brooms { upper one turned upwards. / lower one turned downwards.

On Buoys or Marks on the *West* side of a shoal—

Norway ..... Broom turned upwards.
Sweden .... }
Finland .... } Broom turned downwards.
Russia .... Two Brooms { upper one turned downwards. / lower one turned upwards.

On Marks on a *Middle ground* with Fairway channels on either side—

Norway .... }
Russia .... } A Ball.
Finland ..... A Cross.

Owing to the difficulty in choosing a fourth single colour, Green being universally used to denote a wreck, it practically becomes necessary, in arranging for a general system, if four distinct modes of colouring are adopted to mark the four cardinal bearings of or from a shoal, to resort to one or more parti-colours to be used in conjunction with Red, Black, and White.

On the principle of using four colours to mark the four sides of a shoal, the Committee put forward the following scheme, based on the least change that would be necessary in altering the present systems to a uniform plan; and they recommend the Conference to bring it to the notice of the countries interested, as an example showing that uniformity is attainable if they will agree to consider the subject:—

All shoals marked on the compass system to be marked—

On the *North* side by a single Black or White colour.
South side by Red.
East side by half Red and half White combined.
West side by half White aud half Black combined.

On Rocks in Fairway, with channels on either hand, to be marked Black or Red, with horizontal bands.

If such colours were adopted, then the following changes of colour would be necessary:—

The marks on the *North* side of a shoal would remain coloured Black or White as they now are in all countries using the compass system.

The marks on the *South* side of a shoal would in—
Norway, have to be changed from White to Red.

The marks on the *East* side of a shoal would in—

Norway,	have to be changed from	Black	to half Red and half White.
Sweden,	do.	Black and White	do.
Denmark,	do.	Red	do.

The marks on the *West* side of a shoal would in—

Norway, Denmark,	have to be changed from	White	to half White and half Black.
Sweden,	do.	Red	do.
Finland,	do.	White and Red	do.

The marks on a rock in fairway, with channel on either side, if a white horizontal band is generally adopted, would in Russia have to be changed from black to black or red with white horizontal bands, in agreement with the other countries.

The Committee advise the Conference to invite the various Powers interested to consider the following general principles, which they put forward as a basis on which to build up a uniform international buoyage system for districts other than those where the compass system is in use.

The term starboard-hand shall denote that side of a navigable channel which is on the right hand of the mariner entering from seaward; the term port-hand shall denote that side which is on the left hand under the same circumstances.

Colour.—Buoys defining the starboard-hand shall be painted a single red colour.

Buoys defining the port-hand shall be painted a single black colour, or a parti-colour.

Buoys defining middle grounds shall be painted with horizontal bands.

Form.—Wherever form is used as a distinctive character—

Buoys defining the starboard-hand shall be conical, and those defining the port-hand shall be can or spar.

Top Marks.—Countries where form is not used as a distinctive character for buoys may adopt, as another distinctive feature for the buoys on either side of a channel, top-marks resembling a cone to be used on the starboard side, or a cylinder on the port side of a channel.

Numbers and Letters.—Numbers, letters, and names may be painted on the buoys, but they must never be so large as to interfere with their distinctive colouring.

Wherever numbers and letters are used they shall be in consecutive order, commencing from seaward.

Buoying and Marking of Wrecks.—(*a.*) All buoys and the top-sides of vessels used for the marking of wrecks shall be painted green with a suitable white inscription.

(*b.*) Where it is practicable, by day one ball shall be exhibited on the side of the vessel nearest the wreck, and two placed vertically on the other side; three fixed white lights similarly arranged, but not the ordinary riding light, shall be shown from sunset to sunrise.

Appendix (A).

Report on General Division XII.

A uniform System of Buoys and Beacons.

Proposed Plan for International Buoyage, by Lieutenant M. L. Wood, United States' Navy, United States' Coast and Geodetic Survey.

United States' Coast and Geodetic Survey Office,
Washington, D.C., October 15, 1889.

Sir,

I have the honour to propose the following system of international buoyage for discussion before the International Marine Conference convening in this city 16th October, 1889.

The plan proposed, while of course differing in some respects from that of any nation, will, it is believed, come as near as any towards giving a simple unmistakable method of indicating to a stranger the direction in which to move a vessel in order to maintain the best water and avoid dangers.

Owing to the difficulty at times experienced in locating a buoy by means of its colour, from peculiar conditions of light and background, any plan which will be independent of colour, while sacrificing no good characteristics, would seem to be preferable to any other which is mainly dependent upon colour as the chief feature in distinguishing buoys in entering harbours.

On the other hand, as there are times when shapes are uncertain during fogs and thick weather, when buoys are close aboard but the outlines are indistinct, a plan which relies altogether on shape

alone would seem to be inferior to a plan which admitted a distinguishment by colour while losing the benefits of no other good quality.

For these reasons, in the plan proposed it is considered an essential that the double identificatic by both shape and colour should be used when it is possible, and, in fact, this is fully provided for.

Owing to various positions of ports and channels with reference to the cardinal points of the compass, even in the same country, and possibly in the same harbour, any plan which necessitates both a reference to a compass and to a chart before its warning can be translated into the practical result of changing a vessel's course; and owing to the fact that if a buoy is placed with reference to the east and west or north and south side of the same channel, its meaning may be reversed, it would seem decidedly better to place buoys so that at all times their meanings are the same, by their indication of the right and left side of a channel, irrespective of any reference to the compass,

If buoys can be so placed that when a mariner distinguishes one ahead he will know precisely what is to be done to take his vessel in the best water, without any mental process involving even a small expenditure of time, it would seem for the best in every way to adopt such a system.

To carry out these views the following plan is proposed for discussion:—

Fairway or channel buoys to be of elongated or spar shape, except in shoal water, where nun-shaped buoys can be used, painted in perpendicular white and black stripes, to be of either wood or iron, depending upon the importance of the channel and the size required. In all cases, these buoys to indicate the channel-line or line of deepest water, and they should be passed close to on either hand.

Obstruction buoys or those marking characteristics in the channel which should be avoided, such as sunken ledges, wrecks, or points separating channels, to be nun- or can-shaped, with a perch or broom projecting from the top, painted in red and black in horizontal stripes.

These buoys to be given a good berth and passed on either side. The lower end of an obstruction with a good channel on both sides to be marked by a can-buoy with broom, and the upper end by a nun-buoy with broom. When one channel is the better, both buoys to be of the shape to indicate the side of the best channel on which they are placed.

Starboard-hand buoys in entering to be pointed-top shape, or nun-shaped, and painted red, with even numbers in white paint in main channels and black paint in secondary.

Port-hand buoys in entering to be square-topped, can-shaped, painted black with odd numbers in white paint in main channels, and in red paint in secondary channels.

Main channels to be marked by the largest sized buoys used in the harbour, secondary channels by smaller sized buoys of the same shapes, and minor channels by spar-buoys.

Sea-buoys off the entrances to harbours to indicate initial points for entering, to be either can or nun, red or black, or white and black in perpendicular stripes, with the name of the port in white letters, and to be either automatic bell or whistling buoys, depending upon locality. When a skeleton bell-buoy is used to mark the entrance to a harbour, a watch-buoy, painted either red or black, will be placed just inside the bell-buoy, with the name of the port painted in white letters.

It is quite important to reduce the shapes and colours of buoys to the minimum in order to prevent confusion, and at the same time leave no ambiguity in the directions a buoy gives to a stranger.

It will be noticed that, in the plan proposed, in channels the buoys are distinguished both by shape and colour, and that either one will locate the buoy with respect to the channel; also that when the colour or shape of the buoy is made out ahead, all there is to be done is to change the vessel's course so as to pass the proper side of the buoy, when a further identification can be made by its number when passed as close to as necessary.

There is no change of meaning in any position of the buoy, and hence no uncertainty in the way in which the helm should be shifted.

The only thing that is required to be known is whether the vessel is entering or leaving port to decide which side to leave the buoy in passing; and, in fact, if all ports were buoyed in this manner, and the buoys were in sight, it would not even be necessary to know the name of the port—all that would be necessary would be to follow the buoys as seen with the certainty that if they were properly placed the best water would be followed.

It will also be noticed that the only buoys having projections in the shape of perches or brooms are those placed to mark dangers or obstructions—the horizontal-striped buoys; the reason for this being that there will be less necessity for vessels passing close to them, and hence less danger of the perch or broom being carried away and the distinctive characteristic of the bouy's outline being lost, though, of course, the colour of the buoy would still remain.

When a buoy is placed to mark a point at the opening of a secondary channel branching off from the main channel, it is painted black and red in horizontal stripes, with a perch or broom on the top, but it can be a nun-shape to mark a point between the main channel and a secondary channel on the starboard side, and a can-buoy to mark the point between the main channel and a secondary channel on the port side of the main channel in entering from the sea.

This system includes three shapes of buoys: can, nun, and spar, or elongated.

The only colours are red, black, and red and black in horizontal stripes, and white and black in perpendicular stripes.

With these shapes and colours, if the colour of the buoys be indicated on the Charts, the shapes can be indicated by a single letter (C., N., or S.), an advantage which is quite important.

Trusting that this system may meet with approval of the Conference as an idea for discussion, if not for adoption, very respectfully.

(Signed) M. L. WOOD, *Lieutenant, United States' Navy, Assistant, United States' Coast and Geodetic Survey.*

Rear-Admiral S. R. Franklin, United States' Navy,
President, United States' Delegation, International Marine Conference.

"(*a.*) Uniformity of colour of buoys."

"(*b.*) Uniformity in numbering of buoys."

The subject of a uniform system of buoys and beacons is one of the most important questions which will be discussed by the Marine Conference. The need of a simple and uniform system of buoys has long been felt by seafaring men, and many suggestions have been made and many systems worked out to accomplish this object. Some of these systems have been too elaborate and costly to adopt. The system selected should be that which secures absolute uniformity with the fewest changes to the greatest number of Governments. Buoys and beacons should be distinguished from each other in as many ways as possible, paying due regard to economy and utility. Thus, it is not sufficient to depend upon "colour" alone, for at night, or in misty weather, colour cannot be distinguished. Buoys and beacons should be distinguished by colour, shape, number (letter or name), and, lastly, by carrying some distinctive form or shape of cage-work on the end of a short staff. This "shape," or signal, will be really the most direct and the simplest way of distinguishing the different classes of buoys. In many rivers and harbours, where buoys are subjected to rough handling or exposed to ice the paint, gets rubbed off, and colour cannot be distinguished even by daytime and under the most favourable conditions. At night and in thick weather colour cannot be distinguished at all, and it becomes absolutely necessary to provide some simple and inexpensive way of making a buoy so that it can be recognized from its shape. It is proposed, therefore, to place a "shape" or "signal" on the top of each buoy, or beacon, for the purpose of assisting still further in its identification. These "signals" must be of such a size and shape as to prevent any possibility of error, and must also be so formed as to allow the ice or other obstructions to pass over them without injuring them. For buoys, the signals should be made of cage-work, so that they will be very light, and will not afford any material resistance to the wind or sea. Light angle-iron will be the best, strongest, and cheapest material to use for this purpose. The size of the signal should depend upon the class and size of the buoy upon which it is to be placed, but, in general terms, it should be as large as the existing conditions will allow.

For beacons, the same shapes or signals should be used, but as there is no reason for limiting the weight or surface exposed to the wind, they should be made larger, and the frame should be covered in with sheet iron instead of being merely cage-work.

Speaking roughly, there are only three classes of buoys, although there are several sizes and varieties to each class. All buoys may be classed as "can-buoys," "nun-buoys," or "spar-buoys." The signals must be so designed that they can be fitted to any class of buoy.

In colouring buoys, the great majority should be of some solid colour. If a buoy is to be repainted with one colour it will not be necessary to take it up to do the work, but a small boat can be sent out, and any one can do the painting. Elaborately striped or checkered buoys would require to be taken up every time it was necessary to repaint them, and would thus greatly increase the expense and difficulty of keeping them in order.

As before stated, in selecting any system to be adopted universally, great care should be taken to select that one which will necessitate the fewest changes. The United States and Canada are bouyed on the same system, and have, together, probably more buoys than any three or four other nations. Besides this, the system closely resembles that in use in France, Scotland, and other countries. It is believed, therefore, that a modification of the United States' system will be the best to adopt for an international system. The modifications consist of the addition of signal-cages on each buoy, so as to add an additional means of identifying them. It is also thought better not to insist on that portion of the United States' system which requires nun-buoys to be used on the starboard side and can-buoys on the port side of the channel, as these buoys are frequently used for other purposes, and such a distinction is likely to cause confusion and disaster.

In providing for an international system, only the regular buoys should be provided for. Special buoys should be allowed for special purposes, but should be given some distinctive mark, which, under no consideration, should in any way resemble the regular "signals," colouring, &c.

The buoys provided for are the following:—

1. Starboard-channel buoys (to be left on starboard side on entering port).
2. Port-channel buoys (to be left on port side on entering port).
3. Mid-channel buoys (to be passed close to).
4. Obstruction buoys (channel on either side).
5. Wreck buoys (to mark wrecks, &c.).
6. Mooring buoys (for mooring or anchorage purposes).
7. Quarantine buoys (quarantine station).

The following is the system proposed:—

1. Starboard-channel buoys (to be left on starboard hand on entering port).

Colour.—Red (now used in United States, Canada, France, and Scotland, &c.), with a white horizontal band, 1 foot wide at the top (now used in France).

Lettering, &c.—To be numbered with even numbers, beginning from seaward and numbering in regular order up the river or harbour (now used in United States, Canada, and France).

Signal.—An inverted triangular pyramid, painted white, and made in the form of a cage. To be constructed of light angle-iron, and to be in altitude about twice the length of one side of the base.

2. Port-channel buoys (to be left on port hand on entering port).

Colour.—Black (now used in the United States, Canada, France, Scotland, Holland, and Belgium).

Lettering, &c.—To be numbered with odd numbers from seaward up the river or harbour in regular order (now used in the United States, Canada, and France).

Signal.—A double cone painted black, to be made of angle-iron, in the form of a cage, and to be in length about three times its greatest diameter.

3. Mid-channel buoys (to be passed close to on either side).

Colour.—To be painted in white and black vertical stripes (now used in the United States and Canada).

Lettering, &c.—To be lettered with large Roman capital letters, A, B, and C, &c., beginning from seaward and continuing in regular order up the river or harbour).

Signal.—To carry a plain white staff without any signal.

4. Obstruction buoys (to mark a shoal, middle ground, rocks, &c., may be passed on either side).

Colour.—Red and black horizontal stripes (now used in the United States, Canada, France, Scotland, &c.).

Lettering, &c.—To be plainly marked in large white letters with the name of the obstruction which it marks (now used in Scotland and France).

Signal.—A large cage-work sphere or ball (with ice guards) constructed of light angle-iron, the upper hemisphere to be painted red, and the lower black.

5. Wreck buoys (to mark a wreck or temporary obstruction).

Colour.—Solid green (used in England, Scotland, &c.).

Lettering, &c.—To be plainly marked in large white letters with the name of the wreck or obstruction which it marks.

Signal.—A large cage-work cube, secured by one of its corners. The cube to be constructed of light angle-iron, and to be painted green.

6. Mooring and anchorage buoys (for mooring purposes or to mark anchorages).

Colour.—Solid white (used in France, New York city, &c.).

Lettering, &c.—To be marked in plain black letters with its name or the purpose for which it is placed in position.

Signal.—None.

7. Quarantine buoy (for marking the quarantine limits, and sometimes for mooring purposes).

Colour.—Solid yellow (used in the United States and Canada).

Lettering, &c.—To be marked with black letters with name and object for which placed.

Signal.—None.

Beacons should be painted, lettered, and numbered on the same system, and should carry signals of the same shape. The signals should be made of light sheet-iron, however, and not of cage-work.

In the above cases it is understood that the numbers shall be "Arabic" and the letters "Roman,' so as to secure uniformity.

William C. Whittle, Captain, Bay Line Steamer "Georgia."

A uniformity in system of buoys and beacons is very conducive to safety in navigation, and while all foreign vessels should be required to take a pilot, such uniformity in buoys, beacons, &c., should be international.

(*a.*) The ordinary rule of red buoys being on the left-hand side of the channel and black buoys on the right-hand side as you descend a river or approach the ocean or bay into which it flows, is a good one, and should be international.

(*b.*) In the numbering of buoys likewise, it is necessary to maintain uniformity, with odd numbers on the right and even numbers on the left side of all channels or rivers as you descend towards the mouth or ocean. This numbering should, in my opinion, commence at the mouth of the river or bay and increase as you ascend, with the smallest number at the mouth and the largest at the highest marked point up the river.

Opinions and Suggestions of various experienced Mariners, obtained by Sergeant Paul Daniels, United States' Signal Service.

The present system of buoys and beacons, the manner of numbering them, and the colour of these buoys is satisfactory to most mariners; black and white perpendicular stripes is the best method for colouring buoys, because it is much easier to distinguish them at sea than any other colours.

Uniformity in buoyage is very desirable. Experience in this harbour also shows that it will be an improvement to have all starboard-buoys of a fixed shape as well as colour, and all port-buoys of a

different fixed shape and colour, so that a red buoy may be known as such even if it is not red, the colour having been scraped off by ice or sea-wear.

Extract from Report of D. T. Terrill, Ensign, United States' Navy (in charge of Branch Hydrographic Office, Portland, Oregon), concerning Opinions of Seafaring Men whom he has interviewed.

The United States' system of buoyage gives general satisfaction. Nun-buoys should always be found on one side of the channel, can-buoys on the other; spar-buoys on the same side as nun-buoys should have their upper ends pointed, while those on the opposite side should be squared off. All turn-buoys should have cages.

Extracts from "Beaconage and Buoyage of different Nations," by S. A. Philipsen.

In continuation of the explanation of the "International System of Beaconage and Buoyage" presented by me, I beg to propose the paragraphs in the system placed in the following order:—

1. The mariner when approaching the coast must determine his position on the chart, and must note the direction of the main stream flood-tide.

2. The term "starboard hand" shall denote that side which would be on the right hand of the mariner, either going with the main stream of flood, or entering a harbour, river, or estuary from seaward.

The term "port hand" shall denote the left hand of the mariner under the same circumstances.

3. Buoys showing the pointed top of a cone above water shall be called "conical," and shall always mark the north side of the channel.

4. Buoys showing a flat top above water shall be called "can," and shall always mark the south side of the channel.

5. Buoys showing a domed top above water shall be called "spherical," and shall always mark the east side of the channel.

6. Buoys showing only a mast above water shall be called "spar-buoys," and shall always mark the west side of the chanel.

7. Buoys having a tall central structure on a broad base, shall be called "pillar-buoys," and shall mark the outer and inner ends of middle grounds.

8. Buoys having a round "conical" structure on a domed "spherical" base shall, like other special buoys, such as bell-buoys, gas-buoys, automatic sounding buoys, be placed to mark special positions either on the coast, or in the approaches to harbours, river inlets, &c.

9. Conical buoys, marking the north side of the channel (south side of the shoal), shall always be of white colour.

10. Can-buoys, marking the south side of the channel (north side of the shoal), shall always be of black colour.

11. Spherical buoys, marking the east side of the channel (west side of the shoal), shall always be of green colour.

12. Spar-buoys, making the west side of the channel (east side of the shoal), shall always be of red colour.

13. Pillar-buoys, marking inner and outer ends of middle grounds, shall be distinguished by horizontal stripes of black and red colour.

14. Buoys placed to mark special positions shall be painted in black and white perpendicular stripes.

15. Surmounting beacons such as staff and globe, &c., shall always be painted of one black colour; they may be applied on either side on the channel seamarks at the discretion of the authority having jurisdiction, *e.g.*, as in section 12, "Uniform System of Buoyage for the United Kingdom."

16. Buoys on the same side of a channel, estuary, or tide-way may be distinguished from each other by names, letters, or numbers; even numbers, 2, 4, 6, &c., on the starboard or right hand side, and even numbers, 1, 3, 5, &c., on the port or left hand side from seaward.

17. Buoys intended for moorings, &c., may not be of shape and colour like the sea-marks above described.

18. Buoys for marking submarine telegraph cables shall be of yellow colour, with the word "Telegraph" painted thereon in black letters.

Buoying and Marking of Wrecks.

19. Wreck buoys in the open sea or in the approaches to a harbour or estuary shall be coloured yellow, with the word "Wreck" painted in black letters on them.

20. When a wreck-marking vessel is used it shall, if possible, have its top sides coloured yellow, with the word "Wreck" in black letters thereon, and shall exhibit, by day: Three balls on a yard

20 feet above the sea, two placed vertically at one end, and one at the other, the single ball being on the side nearest to the wreck; by night: three white fixed lights, similarly placed, but not the ordinary riding light.

21. In narrow waters or in rivers, harbours, &c., under the jurisdiction of local authorities, the same rules may be adopted, or at discretion, varied as follows:—

When a wreck-marking vessel is used she shall carry a crossyard on a mast with two balls by day placed horizontally not less than 6 nor more than 12 feet apart, and two lights by night similarly placed. When a barge or open boat only is used, a flag or ball may be shown in the daytime.

22. The position in which the marking-vessel is placed with reference to the wreck shall be at the discretion of the local authority having jurisdiction.

Note.—In Russia no buoys are used as sea-marks in the open sea; to comply with the system proposed, it is only necessary to alter the colour of the sea-marks actually in use accordingly.

Inclosure 15 in No. 143.

Report of the Committee upon Division XIII.

The Establishment of a Permanent International Marine Commission.

Sir, *Washington, D.C., November* 26, 1889.

YOUR Committee have considered the above matter, and beg to report as follows:—

At the commencement of our proceedings we invited our colleagues and the Secretaries to the Conference to furnish us with the proposals, if any, prepared by Governments of the several Powers taking part in the Conference, or of any private Societies or persons, bearing upon the subject in question. We have not succeeded in ascertaining that there are any such proposals in existence save the documents set out in the Appendices hereto, (A), (B), (C), (D), and (E).

We have considered whether such a Commission could be instituted with a practical result, and in such a manner as to lead to its adoption by the Maritime Powers.

However desirable such a result would be, a majority of your Committee does not believe it to be possible to carry it into effect, and is of opinion that it cannot be regarded as one of practical feasibility at the present time.

We have also decided, by a majority of votes, that it is not possible to create an International Tribunal to try questions of collisions between subjects of different nationalities.

In coming to this conclusion, we have been guided, amongst others, by the following considerations:—

An International Commission could not be invested with any legislative power. It would be a consulting body only, constituted with the view of preparing universal legislation on maritime matters of international importance. Apart altogether from the difficulties connected with the formation of such a body, the questions as to its domicile, as to who are to be its members, and how and by whom the members are to be compensated for their labours—difficulties which by themselves seem to be entirely unsurmountable for the present—it seems to your Committee that such a consulting body of experts would not serve the purpose for which it is intended to be created, viz., that of facilitating the introduction of reforms in maritime legislation, because the advice given by such a Commission would not in any way enable the Governments of the maritime nations to dispense with the necessity of considering the subjects laid before them and laying the proposals made to them, if adopted, before the Legislative Bodies of the different States.

The consequence of instituting a body like that in question, on the contrary, would, it appears, be this: that merely another investigation of any scheme proposed with a view to reforming International Maritime Laws would have to be gone through before the opinions of the Governments could be taken, and thus the course of procedure, as it is now—by correspondence between the different Governments—would be made more complicated instead of being simplified. For these reasons your Committee beg to propose to resolve:

That for the present the establishment of a Permanent International Maritime Commission is not considered expedient.

We have, &c.

(Signed) TH. VERBRUGGHE, *Delegate of Belgium.*
OSCAR VIEL, *Delegate of Chile.*
E. RICHARD, *Delegate of France.*
F. SIEVEKING, *Delegate of Germany.*
CHARLES HALL, *Chairman, Delegate of Great Britain.*
F. MALMBERG, *Delegate of Sweden.*
CLEMENT A. GRISCOM, *Delegate of United States.*

To Admiral S. R. Franklin,
President of the International Marine Conference, &c.

I regret that I am unable to sign this Report, as its general tenour varies too much from the views entertained by the Maritime Associations in my country on the important question mentioned in General Division XIII of the Programme.

I have endeavoured to explain the views in this respect of the said Associations, as well as my own opinion, in a letter to the present Committee, which is laid before the Conference as Appendix (C) to the Committee's Report.

(Signed) AUG. SCHNEIDER, *Delegate of Denmark.*

Appendix (A).

REPORT OF COMMITTEE UPON DIVISION XIII.

Memorandum concerning a proposed Permanent International Merchant Shipping Commission.

(Prepared by the Committee of the Second Northern Maritime Conference, September 1888.)

Introduction.

At the second Conference (the first was held in Gothenburg in the year 1883) of Northern (Swedish, Norwegian, Finnish, and Danish) delegates from various Ship-owners',* Master Mariners', Underwriters', &c., Associations and Societies, held in Copenhagen in the first days of July 1888, under the leadership of C. F. Tietgen, Esq., Chairman of the Copenhagen Chamber of Commerce, and in the presence of several Ministers of State, foreign Ministers and Consuls, Government maritime officials, &c., the proceedings commenced with the discussion of the following question:—

"On the establishment of a Permanent International Merchant Shipping Commission."

After a full discussion the following Resolution was adopted unanimously:—

"The development of the shipping trade which has taken place during the last years having given rise to a great number of questions of which the satisfactory solution is of the utmost importance to the trade,

"The Conference resolves—

"That this object best can be attained by the establishment of a Permanent International Commission, and requests the Committee of the Conference to present a Memorandum to this effect to the Maritime Congress which is to be held at Washington in the last days of April next year, and to apply to the Governments of the Northern States to submit the said Resolution with their recommmendation to the Great European Powers and the United States of America."

In compliance with the first part of this Resolution the Committee has appointed the Undersigned to inquire into and report on the question; and in fulfilment of this request we now have the honour to present this Memorandum to the said Congress, and in doing so we propose to divide the Memorandum in four parts, viz.:—

Part I, containing the main points of the discussion; Part II, containing a detailed statement of the development of International Maritime Agreements, with notes referring to Part III, consisting of an Appendix, containing the necessary informations as to the respective Merchant Shipping Laws and Regulations, the opinions or proposals of influential Societies or experts, and references to the nautical works made use of. For the sake of convenience we have also divided Part II in four divisions:—

(*a.*) Under Division 1 we have collected and propose to treat the International Agreements which have been adopted by the Governments of almost all Maritime States, as "The Rule of the Road at Sea," "The International Code of Signals," "Signals of Distress and for Pilots," "International Tonnage Measurement," &c.

(*b.*) Under Division 2 we propose to discuss some other Merchant Shipping Laws or Regulations, in the adoption of which by the other Maritime States Great Britain has taken an interest, which, as yet, has nearly been without result; for instance the Laws on "Official Inquiries into Shipwrecks,

* Representing a merchant fleet of above 2,000,000 register tons, the Scandinavian vessels thus to be placed as No. 3 on the list, No. 1 being the English, No. 2 the United States, No. 4 the German, and No. 5 the French merchant fleet.

Strandings," &c.; "Preventive Regulations as to the sending to Sea of 'Unseaworthy Ships'"; "The British System of marking and lettering of the Names of Ships and their Home Ports, Register Tonnage and Draught, Scale of Feet," &c.

(*c.*) Under Division 3 we propose to give an outline of some other mercantile shipping affairs of a more private judicial nature, which, in our opinion, seem well adapted to be considered as being of an international character, and therefore ought to be treated with due regard to such character.

(*d.*) In Division 4 we have wound up our views as to the usefulness of the proposed Permanent International Merchant Shipping Commission, its eventual composition, mode of action, expenses, &c.

Lastly, in Part IV, we propose to state the reasons for another Resolution, which we are charged by the Conference to bring to the knowledge of the Congress, namely, about the question, "What can de done to diminish the danger which threatens the navigation by floating wrecks?" which, also, was discussed during the Conference.

Part I.

General Remarks as to the Development of International Maritime Agreements, stated in order to show the desirability of a Permanent International Merchant Shipping Commission.

It is a well-known fact that it is only lately that the merchant shipping has thoroughly felt the inconvenience of the discrepancies in the Rules by which its relations in the different countries have been regulated. In former times the navigation of the seas was moving in narrower tracts, more regularly laid down, in such a manner that it was in its whole character in a less degree international, and it is, properly speaking, first, when the enormous development of the steam navigation took place, that efforts were awakened for reforms, which could liberate the navigation from its many checks.

Gradually, as the commercial intercourse has increased, the navigation is getting more and more cosmopolite, and the ship-owners and merchants of all nations are associated in such a manner, that to the commercial world it is an indifferent matter whether the goods are transported in the ships of one nation or another. A well-equipped and well-manned ship, with an able and active master, will make her way in the freight market, whether it is in the coasting or the foreign trade, without any other regard than to the master's capability to fulfil a contract cheaply and punctually.

The natural consequence hereof seems to be that it is in a high degree to be wished for, and in certain respects necessary, that all Laws and Regulations concerning shipping and navigation are drawn up as uniform as it in any way can be accomplished; in short, that in the navigation of the ocean, the highway at sea of all nations, a universal law system should be obeyed. By such an arrangement a multitude of common interests will, by-and-by, be created, and thereby the world will have found the right, although a slow and difficult way by which, at least, the probability of long-lasting wars will be somewhat diminished.

It has hitherto been extremely difficult to get reliable information as to the register tonnage of the merchant fleets in former times. Fortunately, this want has lately been for a great deal removed by a Memorandum, entitled—

"Statistique Internationale. Navigation Maritime," issued in 1887 by the Chief of the Norwegian Statistical Bureau, Mr. A. N. Kiaer. From this interesting exposé we permit us to give a few extracts, viz.:—

In 1850 the entire register tonnage of the North American and the European merchant fleets (of vessels above 20 tons register) was a little above 7,000,000 tons, of which only about 200,000 tons were steam-ship tons; in 1860 the tonnage of these fleets had increased to about 11,500,000 tons register, of which about 750,000 were steam-ship tons, and in 1886 it may be estimated at about 18,000,000 tons, of which about 7,500,000 were steam-ship tons. Thus, for the last twenty-five years the total tonnage has increased about 57 per cent., but in steam-ship tons about 900 per cent. Forty years ago the total tonnage did not reach the present steam-ship tonnage, and when it is remembered that every steam-ton performs the work of at least 3 sailing-tons, the increase must be said to have been quite gigantic. The three cardinal points which characterize the last forty and specially the last twenty-five years are thus, an enormously increased register tonnage, an increased use of big ships instead of small ones, and the creation of a gigantic steam-ship fleet.

A natural consequence of the above-named mighty changes in all shipping affairs has been an intensely felt desire of additions to and improvements in the Laws and Regulations under which the navigation formerly could live and thrive, but which cannot give satisfaction any more; and though reforms were rather tardily introduced in the different countries as a consequence of the slow working of the State machinery, it must be admitted that their Governments, on the whole, have showed zealousness and activity in meeting the wishes of the mercantile community, and most of the newest maritime laws bear the testimony thereof, though it is not an easy task to reconcile the necessities of the State with the claims which commerce and navigation means to be entitled to put in. But even this does not suffice, for, the more lively the intercourse between the nations has been, the more international character the navigation gains, the more the above-named want has been felt, and a necessity has arisen for better uniformity of the different Laws. When a ship makes a freight contract to the fulfilment of which the assistance of a foreign Court of Justice must be sought or caused by a collision or a casualty, it comes under foreign jurisdiction; the owner or the master will probably see their intentions and acts weighed and judged according to Rules they do not know, and which do not agree with the basis for their dispositions. This has caused and will continue to cause inconveniences of different kinds; therefore, year by year, the want grows to obtain Regulations having validity every-

where in the world, which can complete the laws of the individual country and arrange the international side of the shipping affairs.

While the Governments in other matters of international character have displayed great energy for the creation of Agreements, for instance, the International Meter Convention, concluded in Paris on the 20th May, 1875; the International Telegraph Convention, concluded in St. Petersburgh on the 10th (22nd) July, 1875 (revised in Berlin on the 17th September, 1885); the International Post Convention, concluded in Paris on the 1st June, 1878; the International Conference for the Protection of Submarine Telegraph Cables, concluded in Paris on the 14th March, 1884; the Sugar Bounties Convention, concluded in London on the 30th August, 1888; they seem to take up a much more reserved position as to the creation of International Merchant Shipping Regulations.

The Belgian Government forms an exception herefrom in the latest time; for example, it will be remembered, that in the spring of 1885, they invited all Maritime Powers to send Delegates to a "Congrès International de Droit Commercial," to be held in Antwerp on the 27th September the same year. Many maritime questions of great consequence were here discussed, with intimate knowledge of the matters and with great ability, but in this respect we must confine us to refer to the excellent Report named "Actes du Congrès International de Droit Commercial" (d'Anvers, 1885). Even this invitation seems to have been treated with a certain reluctance, which may be proved by the fact that several maritime countries were not represented at all, and that it cannot be seen that any of the Delegates present has, in an official manner, expressed any opinion as to the questions under discussion. In private circles steady efforts have, however, been made for the solution of the said questions, particularly by the Association for the Reform and Codification of the Law of Nations, with head-quarters in London. As a private institution this Association must confine its labours to the formation of propositions or recommendations to the authorities, and besides work for the propagation of its transactions and papers, and therefore, the highest point to which it has reached is giving the impulse to reforms in some directions.

At it must be admitted that Great Britain is in possession of the most accomplished Maritime Laws, drawn up with the greatest practical knowledge of the subject, the first general question which is steadily put forward is, how this great maritime country has ruled in this or that nautical question. In these respects it cannot be denied that England, especially in the latter years, has experimented in the interest of all other countries with great sacrifices of painstaking labour and capital. Of course the natural explanation of these sacrifices is partly her mighty merchant fleet, with a tonnage at least as large as the tonnage of the fleets of all other countries together, and partly that the relations of this fleet are embraced with an interest and love of which the like cannot be found in any other country. It is therefore both natural and prudent that the more or less insignificant maritime countries on the whole, and where it can be done without giving up their independence or peculiarities, subordinate themselves to the British systems. In these circumstances the principal cause must be sought in the fact that the other maritime countries hitherto tacitly have conceded to Great Britain the leadership through its Board of Trade of almost all maritime transactions and Agreements of an international character, and this has particularly been the case since the Board of Trade, by the Merchant Shipping Act Amendment Act of 1862, Articles 58, 59, 60, and 61, had, according to issued Orders in Council, acquired power to treat vessels belonging to States having adopted certain British Maritime Laws or Regulations in the same manner as English vessels are treated. In accordance herewith the Board of Trade has gradually with great energy, and, on the whole, with success, got the British Rule of the Road at Sea, the English-French Code of Signals, and although with doubtful modifications, the Moorsom's system of tonnage measurement adopted in almost all maritime countries, which thereby have acquired advantages of consequence, for which the whole maritime world must to Great Britain be thankful, and it ought not here to be passed in silence that the thanks in this respect particularly must be directed to the well-known Secretary to the Marine Department of the Board of Trade, Thomas Gray, C.B., who for more than a generation has worked unflinchingly for the promotion of international maritime matters, not only in his official situation, but also through numerous treatises in newspapers and periodical nautical magazines.

Though the above-named Agreements may be considered as being of very great international value, still they are incomplete, and there is an everywhere felt and constantly growing want for different other International Agreements; nevertheless, the years pass by without sufficient regards being paid to such wants, and it may therefore be asked: What can be the cause why all these efforts both from official as well as private sources have been given so comparatively poor results? Our answer to this question is: The cause must simply be sought in the want of a Central Institution, whose duty it is to follow and lead the development of the maritime affairs, and which at the same time can be the joining link between navigation, as far as it is international, and the Marine Government Departments of the different countries.

Though England, as before said, hitherto has been the natural leader, it has, even for this mighty Maritime Power, been an unsolvable task to lead sufficiently quickly and steadily, and this is not difficult to explain. Firstly, the British Board of Trade must be won for this or that reform, which may often be hard work enough. Next, if it succeeds, the Board begins to act by writing to the British Foreign Office, which again writes to the Foreign Offices of the other countries, and these again to a number of Departments in the respective countries, which also have to procure the opinions of existing institutions, or of Commissions especially appointed for the purpose, and the answers have to go the same long way back again to the Board of Trade, and for every little change proposed by any of the countries the question must often repass the same way. How can it be otherwise than such a machinery works too heavily to be satisfactory for the wants of the navigation at the present times, and how can it be wondered at that the above-named Government Department hesitates a long time before it moves, and generally first does so when the public opinion has gained such strength that it cannot longer be ignored?

And last, not least, there are the Parliamentary difficulties to overcome, but of this delicate side of the question later more under Part II.

The natural and, in our opinion, the only way to conquer all such difficulties will be that the Maritime Powers agree to establish the herein proposed "Permanent International Merchant Shipping Commission."

Such a Commission, consisting of experienced Delegates from all maritime nations, would form a sort of united representation for the common shipping interests of all such nations; it would have to watch over these interests, and to test the propositions which might be presented for its consideration from different quarters, and to their furtherance formulate such proposition as joint resolves to the Governments represented. The Commission, as consisting of experts on every nautical subject, would be in possession of so much knowledge from all countries of the matters, that every question taken up by it would be sure of getting an universal and serious treatment; the difference of opinion which now is the cause of never-ending correspondence would, through a quiet personal discussion at the meetings of the Commission, in most cases be smoothed down without difficulty, and it would thus be far easier than now to come to harmony about anything sound and good. And in like manner, as every one interested in shipping affairs would feel satisfied, knowing that an institution exists whose duty it is to watch the development, and to whom they could address their wishes, sure of their being taken into consideration, and not shelved in the archives of one Department or another, the Government would acquire a mighty support in carrying through a certain maritime reform. A proposition—unanimously agreed to by the Commission, which accordingly should appear as the unanimous expression of the opinion of the experts in the whole civilized world—a Government would always easier carry through than its own perhaps one-sided views, even if these are supported by private resolutions. And, finally, when a proposition appears as the outcome of the labours of the whole Commission, in which all nations have an equal part, there would be no room for mutual jealousy between the States to appear and embroil what, on its merits, deserves to be furthered.

For the better proof of our statements, as well as of the necessity of the said Commission, we propose in the following Part II separately to treat the existing or proposed International Maritime Agreements as described in the introduction.

Part II.

Division 1.—*Existing International Maritime Agreements.*

(A.)—"*International Regulations for preventing Collisions at Sea.*"

Half a century ago, as it is well known, there did not exist any written Law or Regulation for the prevention of collisions between ships at sea. There was then only a general "custom of the sea," which prescribed that sailing-ships going with a free wind should give way to close-hauled ships, and that of two close-hauled ships the close-hauled port-tack should give way to the close-hauled starboard-tack. But, of course, such primitive state could not last when the steam-ships commenced to plough the seas, and when the navigation on the whole was becoming livelier. At first it was mostly in narrower fairways that the want of more comprehensive and distinct Rules was felt, and the single States, therefore, issued Regulations, which certainly were of more or less mutual likeness, but yet were not the result of mutual negotiations. Only England and France concluded Agreements as to common Rules, what is easily explained by their joint interests in the navigation of the Channel.

It is not our intention here thoroughly to represent the development of the Rule of the Road, as such may easily be found in several excellent treatises on this subject, of which we particularly refer to the most complete and instructive ones we know, named in the Appendix under Note 1. For our purpose it will be sufficient to go back to 1863, when England succeeded in gaining the adhesion of the other seafaring nations to the English-French Rules of the same year (Order in Council, January 9, 1863). Since then twenty-five years have passed, but a Jubilee these Rules could not hold, and those who believed that their development under the leadership of England should advance in a safe and satisfactory track must have felt somewhat disappointed. The Rules of 1863, with the supplemental or explanatory provisions of 1868 to Article 13 of the Rules (Order in Council, July 30, 1868), remained in force sixteen years; but these English-French—now International—Rules were constantly the object of criticism and attacks from different sides, and a revision was at last found unavoidable, which took place in 1879 (Order in Council, August 14, 1879). Nevertheless, shortly after, a Supplemental Order, dated the 24th March, 1880, was passed, putting off Article 10, relating to the lights of fishing-vessels, and in lieu thereof Article 9 of the Regulations, authorized by Order in Council, 1863, was substituted. By the revised Rules of 1879 no fundamental changes took place. The Rules continued unaltered in substance, but some points which required elucidation were improved, and some other points, where experience had shown that additions were necessary, were also provided for. (See Appendix, Note 2.) Nevertheless, these revised Rules had some weak points. One of these was Article 5, "Day and Night Signals for Steam-ships not under command," by which the same signals should be given by a steam-ship which, in consequence of accident to her machinery or steering gear, or for any other reason, is not under command, as by a steam-ship laying or picking up a telegraph cable. Against this confounding intimacy, which might lead to dangerous misunderstandings, the Telegraph Companies naturally enough protested, and proposed different and distinct signals in both cases. That Article 10 had been put off, as before mentioned, was also very unsatisfactory, and the consequence was that, instead of the Rules of 1879, the Rules of 1884 (Order in Council, August 11,

1884), were issued. By these Rules Article 5 was changed as proposed, but the new Article 10, "Lights and Signals for Fishing-Vessels," had the same unfortunate fate as the former Rule. The owners of fishing-vessels protested with much energy against the system of lights ordered by this Article, and as the British Board of Trade did not see its way to enforce these provisions against the wishes of several influential Members of Parliament, it gave its sanction through a Supplemental Order in Council, dated the 30th December, 1884, to a new and complicated system, the so-called "Grimsby Duplex-System." The same unfortunate story was repeated, the fishing representatives, backed up by the same Member of Parliament, would not adopt this system, but insisted on the undisturbed carriage of the sole bright white light when fishing as prescribed by the Rules of 1863, and, in addition, in case of trawlers, of a red flare-up. The Board of Trade did not find it prudent to resist this renewed Parliamentary pressure, and therefore gave the matter up, as will be seen by the Supplemental Order in Council, dated the 24th June, 1885, by which the last-named system was allowed for sailing trawlers. The consequence of these wavering Orders is that English, and probably also other trawlers, may be met with in the North Sea carrying, when fishing, either—

1. The common coloured side-lights (eventually also a white top-light);

2. Two top-lights, the upper red and green on the sides, and the lower bright white (the Grimsby Duplex-System); and finally

3. A bright white top-light and occasionally a red flare-up.

It appears, however, that German, Dutch, Belgian, and Danish "trawlers" only use the last-named light signal.

It cannot be denied that the leadership of England in this respect has been rather misleading, as it repeatedly obliged the other Maritime Governments to rescind their Regulations expressly adopted on the recommendation of the Board of Trade, but the worst feature is that the confusion which at present reigns may easily lead to loss of life by collisions between fishing-vessels and other vessels.

Nevertheless, almost all Maritime Powers have step by step adopted the British Rules of 1884 (with the exception of the said Article 10); for instance, Norway by a Royal Ordinance, dated the 28th January, 1885; Sweden by a Royal Ordinance, dated the 20th February, 1885; the United States of America by an Act of Congress, dated the 3rd March, 1885; Holland by a Royal Edict, dated the 26th June, 1885; Denmark by a Royal Decree, dated the 18th February, 1887.

Unfortunately, the question of lights for fishing-vessels has not been the only weak point in the leadership of England. The criticisms on the one side, and the deplorable experience as to the number and character of the increased collisions on the other side, has driven England from revision to revision, and yet the matter is still in such a plight that almost all other countries agree that the Rules are in need of improvements and additions. Both the system of lights (see Appendix, Note 3) and the system of fog-signalling (see Appendix, Note 4) are insufficient, and though the Rules commonly, and in our opinion rightly, are considered as based on "sound, practical, and seamanlike" principles, not a few of their Articles still want elucidation and additions. (See Appendix, Note 5.)

The cause of this unfortunate situation of these Rules is mainly, as far as we are able to judge, that England in spite of suggestions made by France and Russia (see Appendix, Note 1, under "Parliamentary Papers") has refused to treat the matter in an International Conference, stating that such proceeding would be "undesirable." All transactions in this respect have, therefore, been conducted by correspondence through the troublesome ways formerly described; the propositions or proposals made from different countries have, therefore, not undergone the intimate inquiry they had deserved, and the Rules have undoubtedly suffered thereby. For a comparison, what would be the fate of a law, when the mode to frame it was not by exchanging opinions through a debate in Parliament, but in such a manner that every Member should write to the Speaker, and he alone had to formulate the law according to all these writings? And yet, in fact, such proceeding is now the ordinary way, and therefore the situation is as it is, and no advance will be made before this method is totally changed.

As an instance illustrating that the above-named proceedings in the present steam age may be called "slow coach driving," we may name the time spent before the adoption as an International Agreement of the Article 16 of "The Merchant Shipping Act," 1873, "Duties of Masters in Case of Collision," was accomplished.

Here Great Britain has not failed in her calling, but has strenuously and repeatedly recommended its adoption. Though the desirability of such a provision seems self-evident, as it is dictated by simple regard to the sake of humanity, it took fifteen years before it was universally adopted. We believe Norway was the first, by a Merchant Shipping Law, dated 3rd June, 1874, then Germany, by a Royal Decree, dated 15th August, 1876, and lastly, we are sorry to say, Denmark, by a Law of 23rd March, 1888.

Another side of this question being intimately connected with the inquiries as to collisions, we have found in a British "Merchant Shipping Bill" of March 1884, which we regret was not passed. This is the matter treated in Article 79, which we think would have been very well suited for adoption as an international prescription. We, therefore, think it advisable to reproduce this Article with only a slight modification of the first lines, viz.:—

"As soon as possible, and at the latest 24 hours after a collision with any other ship has occurred, every master of a ship shall make or cause to be made an entry in the official log-book, containing a full report, stating the circumstances under which the collision occurred, and which ought to be certified by sign-manual by the officer of the watch, the helmsman, and the look-out.

"Such entry shall, in particular, give information as to—

"(*a.*) The course and speed of the ship when the other ship was first seen, and the direction and force of the wind;

"(*b.*) The estimated bearing and distance of the other ship when first seen;

"(*c.*) The light or lights, or, if the collision occurred during daylight, the apparent course of the other ship when first seen;

"(*d.*) Any alteration in the lights or course of the other ship before the collision, and the distance at which such alteration occurred;

"(*e.*) The steps taken on board the master's own ship to avoid a collision, and the estimated distance at which such steps were respectively taken;

"(*f.*) The parts of each ship which first came into contact;

"(*g.*) The master's opinion as to the cause of the collision."

We are firmly convinced that such an international arrangement would be of very great consequence for the inquiries and judgments by the proper Tribunals in collision cases, particularly between ships belonging to different countries. The want of such an arrangement contributes probably much to the present ingenious formulation of marine declarations by the so-called "sea-lawyers," which as a rule, are more misleading than leading. In our opinion the agreement mentioned here would often be a sure preventive against such erroneous practice.

Under the revised Rules of 1884 the "Signals of Distress" are taken up under a new Article 27 Substantially the same signals were introduced by "The Merchant Shipping Act," 1873, section 18, and on the recommendation of Great Britain, gradually adopted by the other maritime countries, for instance by Germany, according to a Royal Decree of 26th February, 1876, and these signals must, therefore, now be considered as internationally adopted; the only change introduced by the said Article is that while the Act prescribed as a night signal of distress, "rockets or shells of any colour or description the Article prescribes, "rockets or shells throwing stars of any colour or description." This addition is certainly an improvement, as two or more rockets, without stars, fired simultaneously, are used as distinguishing signals for the mail-packets and other passenger liners in pursuance of section 21 of "The Merchant Shipping Act Amendment Act, 1873," and might, therefore, formerly have been mistaken for signals of distress. Nevertheless, we find in the "Instructions for Surveyors of Ships," edition 1887, issued by the Board of Trade under Article 48, "Statutory Distress Signals," the signals specified in the Act of 1873 reprinted without any mention of the above-named change, but this is certainly rather misleading, at least for a foreign inquirer.

The "Signals for a Pilot," by Article 19 of "The Merchant Shipping Act, 1873," the Board of Trade has also by degrees got internationally adopted, and these signals have since remained unchanged.

"*The Difference in the Command to the Helm.*"

Identical nautical terms for these commands are of the utmost consequence for the practical and safe use of the "Rule of the Road." Until 1874 terms having the same meaning were everywhere in use; but since that time an unfortunate change has taken place, as in all French ships, German, Austro-Hungarian, and Italian Government ships, and partly in Swedish ships, "Port," or "Helm to port," means that the helm shall be put in such a way that the ship turns to port, or to the left, while this command in the other maritime countries, according to the old tradition, means that the helm shall be put in such a way that the ship turns to starboard, or to the right. The above-named change has created a confusion which already has led, and probably will continue to lead, to deplorable collisions with loss of life, particularly as it has been proved by Law Court suits in collision cases that there are still pilots to be found who are not aware of what command is to be used in the ships of the various nations. It is, therefore, in the highest degree to be wished for that harmony should be procured in such a manner that the command derived from the time when steering was effected by a tiller should be abolished—so much more, as this practice is directly at variance with the commonly used signs to the helmsman, viz., beckoning with the hand to the right for altering the course to starboard, and *vice versâ*—but as England hitherto has been unwilling to hear of any change in this respect it would, in our opinion, be far better meanwhile to adhere to the ancient British custom. To leave no room for mistakes in the future, the wording of the only Article in the whole of the Regulations which used to contain the injunction to "port the helm" (Article 15) has been altered to "that each shall alter her course to starboard."

That the Northern Conference does not stand alone in its wishes for improvements in the "Rule of the Road" we could prove by many examples, but for the present we will confine us to cite a part of a Resolution we have found in the Report of the eleventh Conference (in 1883) of the Association for the Reform and Codification of the Law of Nations, viz.:—

"That it is desirable that the Powers should agree in establishing an International Court of Appeal whose decisions might be sought by the Powers themselves in case of conflict in the interpretation or application of the International Laws and Regulations to collisions at sea.

"That, to obviate all risks of mistranslation, it is desirable that the Maritime Powers should appoint an International Commission, composed of carefully selected experts, to prepare and publish, with the sanction of such Powers, an authentic polyglot text of the Regulations and Code of Law above referred to."

In the Report of the thirteenth Conference (London, 1887) of the said Association, the following Resolution was also carried:—

"That a Committee of five, with power to add one member from each maritime nation, be appointed by the Chairman to inquire into the best mode of preventing collisions at sea, and to report thereon to this Association at the next Conference."

While, in principle, agreeing with these Resolutions, proposed and carried by eminent English

experts, we are decidedly of opinion that their aim would be far better attained if these matters were taken in hand by the herein proposed "Permanent International Commission."

Finally, we permit us to express the hope that the honourable Congress will not lose sight of the plan for diminishing the chances of collisions laid down as early as in 1856 by the world-renowned American scientific navigator, Lieutenant Maury. As it is well known, he laid down in the Charts of the Atlantic Ocean two lane routes for the regular steam traffic between New York and Europe: the northward for from Europe coming—and the southward for from North America going—steamers, divided by a belt 50 miles broad under Cape Clear, and gradually increasing to 200 miles on 50° western longitude.

By following the advice of Mr. Maury, all steamers coming from or going to the Channel would be sure to avoid each other; nay, even those from or to Brest and Nantes going steamers would, by making a small détour and seeking these routes, obtain the like security under the passage. But not only that such a benefit would be obtained, this ingenious author says, all sailing-ships would be, by keeping outside of this belt, considerably secured, and if circumstances carried them thereinto, they would have a yet stronger occasion to be still more attentive. He winds up with about these words: "It is self-evident that such a plan does not in the least permit the neglect of the sailor's best supports—his log, his lead, and the look-out."

Some steam-lines, as the "Cunard" and the "White Star," advertise, as it is well known, that their steamers take the lane routes recommended by Lieutenant Maury, on both the outward and homeward passages, but such cautious navigation is rather an exception than a rule.

This question has been much under discussion in the Scandinavian nautical circles, and some experienced navigators recommend that not only between North America and Europe, but also in the Channel and in the Sound, such Rules ought to be internationally adopted. For instance, it has been suggested that in the Channel all through-going steamers coming from the west should keep in the outline of the offing of the English lights, and from the east they should keep closer to the English coast; and that in the Sound such steamers coming from the south should go through the Flintrännan, and to the east of the Isle of Hven, while all such steamers coming from the north should go along the coast of Zealand, and through the Drogden.

When it is remembered that it has been proved by a Report, dated the 16th April, 1884, drawn up by a Committee of Experts appointed by the Society of Arts in London, that the English-American mail-packets under the passage in the open ocean, even in foggy weather, steam along with full speed, and that this is now between 15 and 20 knots, and that the increase of such steamers has been enormous, and that there is no probability of such racing being put a stop to, we are strongly of opinion that something more definite must be done in the direction recommended by Lieutenant Maury. If his advices thirty years ago, as we firmly believe, were sound and good, they must certainly be the highest wisdom now-a-days, having regard to the facts mentioned under Part I. We therefore hope that it will be taken into consideration whether the principle laid down in Article 21 of the present Rules, "that in narrow channels every steam-ship shall, when it is safe and practicable, keep to that side of the fairway or mid-channel which lies on the starboard side of such ship," could not in some way or other, under a coming revision of the Rules, be modified so as to serve as a guide for the navigation in other fairways, at least for steamers in regular passages.

(B.)—"*International Code Book of Signals.*"

The Board of Trade, having always taken a great interest in sea-signalling, appointed in 1855 a Committee "to inquire into and report upon the subject of a Code of Signals to be used at sea," and in the following year a Signal Book was submitted, based on the principle of the present Code; but it was first in the year 1864, after it had undergone a revision by an Anglo-French Commission, that it gained international acknowledgment, and it is now adopted both by men-of-war and merchant-vessels of all nations. This Code Book has now been issued in ten or eleven different languages, and almost all sorts of communications can now be exchanged between ships and with signal-stations without regard to the language spoken by the crew.

So far all was well, but the development of the commercial and shipping affairs has been so vast these twenty years that a Code which was then sufficient is not so any more. There are constantly created new maritime inventions and nautical terms as well as ports and maritime places, whose names ought to be added, but experience has amply shown that it is very difficult for other countries than England to get such improvements or additions introduced. Perhaps this is partly owing to the manner—rather difficult to understand for a Continental observer—in which this book is issued in England. It seems to be prepared under the authority of the Board of Trade, but its editor is the Registrar-General of Shipping and Seamen, and it is, as well as the "Code List," printed and owned by the "Shipping and Mercantile Gazette." While this undertaking is half Governmental and half private, the establishment and management of signal-stations on the English coast seem to be quite private, as almost the whole of them are at present owned by Lloyd's, or the "Shipping Gazette." Pressed from various sides, the Board of Trade in 1884 asked the maritime countries to send in proposals for a revision of the Code Book, but only as regards changes in coins, weights, and measures, and changes or additions to the geographical signals, but it does not appear that the proposals have been adopted but in an almost imperceptible degree. A great lacuna in the Code is also that it does not contain any system of night-signals, though several well-considered plans have been submitted to the Board of Trade (see Appendix, Note 6). Rocket-signals from light-houses to distressed ships, as introduced by the Dutch Government from the 1st July, 1888, we think ought also to be adopted as international signals.

The Board of Trade has, in the beginning of this year appointed a Committee of Delegates and Experts from that Department, the Trinity House, Lloyd's, &c., with Mr. Thomas Gray, C.B., as Chairman, to report on this matter, particularly to bring the International Signal Book up to date, and to advise "whether the time has arrived when it may be deemed desirable to establish a system whereby the signals in the International Code Book may be made by night as well as by day."

No doubt this matter has now been put in the very best hands, but, as we have stated under Part I, the changes proposed will have to go the described long and weary international way several times before anything can be settled, while if the herein proposed Permanent Commission existed, everything would be finished much quicker, and certainly, at least, as well.

"Also this matter would therefore, in our opinion, be well served by being put under the wings of the said Commission."

(C.)—"*International Tonnage Measurements.*"

The following remarks are, on the whole, a reproduction of a Memorandum published in the English language by the Danish Board of Customs in the autumn of 1878, and as it was considered necessary, on account of the Agreements concluded between the various Maritime Powers having adopted the British measurement system, as to the mutual recognition of the national tonnage measurement, or, at least, suitable to the purpose, that any reform which may bring along with it an alteration in the registered tonnage that existed at the time when the Agreement was concluded should be made a matter of mutual communication between the countries concerned. This Memorandum was presented to the Governments of the principal Maritime States as an explanation of the reasons which led Denmark to give up the so-called "British Rule" (the 32 per centage deduction of the gross tonnage of screw-steamers), and only to use the so-called "Danube Rule," proposed by the International Tonnage Commission of Constantinople, 1873, and adopted by the European Commission of the Danube from the 1st January, 1877, as well as by the Suez Canal Company from the 1st July, 1878.

The present British measurement system, commonly called "Moorsom system" after its inventor, the first Surveyor-General for Tonnage in England, was introduced in that country by "The Merchant Shipping Act, 1854," Articles 20 to 30, from the 1st May, 1855.

This system consists, as it is well known, in all its simplicity, therein, that the cubic contents of all inward spaces, as well under the decks as of the permanent and covered-in erections on the uppermost deck, are measured with as great mathematical exactness as the circumstances on board ships may permit. The sum of the cubic contents thus ascertained, converted into tons register à 100 cubic feet makes the gross register tonnage. From this tonnage, again, is deducted the sum of the tonnage of certain partitioned-off spaces in the ships, as crew and engine-room spaces. The rest, then, shows the net register tonnage of the ship, which, as it is well known, in most cases, constitutes the norm, after which dues are levied on the shipping.

Directly after the emanation of "The Merchant Shipping Act Amendment Act, 1862," mentioned in the introduction, the British Board of Trade, enabled by Article 60 of this Act, issued a Memorandum accompanied by an invaluable treatise on the subject by Mr. Moorsom, called "Review of the Laws of Tonnage," London, 1853, in which the prominent qualities of the British system were explained, and the international advantages obtained by its adoption were shown.

As the net register tonnage forms the norm according to which the different dues on shipping are calculated, and as the great differences which then existed between the tonnage measurement of various countries led to great loss of time, expenses, and troubles of different kinds by the continuous remeasurements every time a ship discharged or loaded abroad, it was manifestly a great benefit England bestowed on the whole maritime world by the aforesaid step.

Nevertheless, the negotiations to bring about so desirable a result have lasted for many years, and only after long and patient discussion they have resulted in the present approximation to uniformity of practice.

In the United States of America the Moorsom system was introduced from the 1st January, 1865, but at first only with regard to the gross tonnage. By a new Act of the 5th August, 1882, the net register tonnage was also there established as the norm, as by this Act deductions for crew-spaces and engine-room according to the "Danube Rule" were allowed.

By degrees the system was adopted by the European Maritime Powers; thus by—

Denmark	From October	1, 1867.
Austria-Hungary	„ September	1, 1871.
Germany	„ January	1, 1873.
France	„ June	1, 1873.
Italy	„ July	1, 1873.
Sweden	„ April	1, 1875.
Holland and Spain	„ January	1, 1876.
Norway	„ April	1, 1876.
Finland	„ June	1, 1877.
Greece	„ July	1, 1878.
Russia	„ January	13, 1880.
Belgium	„ January	1, 1884.

Outside Europe the system has been adopted by—

Chile	„ January	1, 1875.
Argentine Republic	„ January	1, 1877.
Japan...	„ July	1, 1884.

"Deduction for Spaces occupied by or necessary for the Propelling Power in Steamers."

According to the Merchant Shipping Act, Article 23, this deduction is computed after the result of the measurement of all spaces that are occupied by, or necessary for, the proper working of the engines and the boilers (the coal-bunkers not included), and when—

(*a.*) The tonnage of these spaces so ascertained in screw-steamers is above 13 but under 20 per cent., and in paddle-wheel steamers above 20 but under 30 per cent. of the gross tonnage of the ship, a deduction of respectively 32 and 37 per cent. of the gross tonnage is allowed;

(*b.*) In all other cases, but now seldom met with, the deduction is computed by adding to the tonnage of the above-mentioned spaces 75 per cent. for screw-steamers, and 50 per cent. for paddle-wheel steamers.

It may here be well to note that the Rule (*b*) is identical with the so-called "Danube Rule," but that, nevertheless, the Rule (*a*) only bears the name of the "British Rule."

More than thirty years these curious and complicated Percentage Rules have been in force; thus there has been a superabundant opportunity to prove how unsatisfactory and irrational the results found out in this way may be.

This has, for instance, been proved by many examples shown in the explanatory Tables of the Danish Measurement Memorandum, but it will here be too prolix to repeat such examples. Of course, the faults of the "British Rule" are well known in England, and as a proof hereof we may mention that Mr. Thomas Gray, in his evidence before the Select Committee on the Tonnage Bill of 1874, in this respect made use of the following noteworthy expressions:—

"It is indeed an anomaly that a great maritime country like England cannot get rid of a few bad features in an otherwise excellent Measurement Law, which, instead of being a pattern to the other nations of the world, thereby is made a thing they should most avoid."

Among a number of essays on "Merchant Shipping Legislation," published in the "Nautical Magazine" for 1871, Mr. Gray has given further elucidation of this question, which, in his usual way, is as sound in its reasonings as it is clearly put. Herein the "British Rule" is denounced as irrational and absurd. In the same "Magazine" for 1887, in an article on "Saving Life at Sea," a striking example as to the impossibility of using the net registered tonnage according to the "British Rule" for any practical purpose whatever is mentioned thus:—

"The steamer 'Bournemouth,' which went ashore in a passage from Torquay to Bournemouth, and was certified to carry at sea 372 passengers, was 232 tons gross, but under 7 tons register, and was free from inspection simply because her builders and owners possessed contrivance and ingenuity enough to avail themselves to the fullest extent of the vagaries in the Laws governing register tonnage, and brought that in her case down to below 7."

In the "Shipping and Mercantile Gazette" we have also found a very pertinent letter, dated the 1st October, 1887, on this subject from one on the question of register tonnage "completely puzzled" writer, who winds up his remarks as follows:—

"A glance at the 'Mercantile Navy List' will soon convince the most sceptical that this is no overdrawn statement. For example: There is one whose gross tonnage is 135 tons, net tonnage *nil*; another, gross tonnage 116 tons, net tonnage *nil*; another, gross tonnage 160, net 17 tons; and another, 244 tons gross, and 33 tons net; and some of these are paddle-wheelers taking up the room of at least two ordinary vessels. How these figures are arrived at it is impossible for any one not being an expert or a conjuror to say; but it is possible, with a little more practice in this direction, that some steamers may be reduced to so many tons less than nothing, and then the question may arise if harbour authorities will have to pay them for the privilege of entry, and at the same time be liable in case of damage, should any occur, through defective moorings or a stray order from a Harbour-master."

Finally, we find in the Report of the last (1881) British Royal Commission on Tonnage, the following statement:—

"In the case of the steam-tug 'Clyde,' of Greenock, her tonnage is registered as minus 4·64, her gross tonnage being 87·72 tons, and her deductions 92·36. We have it in evidence that this vessel occupies space in harbours and docks without the authorities being able to levy any dues whatever upon her for the accommodation she enjoys."

Of course, the builders of steam-ships have made themselves thoroughly acquainted with such vagaries, and it is now almost always the case that, in countries which make use of the "British Rule," the actual engine-room is given such a size as to be just above 13 per cent. of the gross tonnage, thereby acquiring the right of the 32 per cent. reduction, but also not seldom thereby doing damage to the proper construction of the engine-room, and, of course, causing considerable loss as to the light, harbour, and dock dues, and last, not least, it is prejudicial in the highest degree to the sailing-ships. The professional experts are, therefore, everywhere extremely anxious of getting rid of such a Rule, which owes its too long existence only to the circumstance of being inserted in a Maritime Law of Great Britain, and to the particular difficulties in changing that Law.

It cannot, therefore, be said that the following assertion, used in the Danish Memorandum in the winding-up of the comparisons between the different Rules, is unfounded, viz.:—

"That the 'British Rule' is most deficient as to accurateness and equity."

The British Board of Trade, being fully aware of the inconvenience in this respect, has made most strenuous efforts for introducing a reform, but has hitherto totally failed in every such attempt.

Thus, already in the year 1860, the obnoxious Rules for the deduction for propelling power were abolished in an administrative way. Several Steam-ship Companies, which thought their interests threatened, brought the question before the English Courts of Justice, whereby the improved mode of proceeding was reversed. In the year 1867 a Memorandum, entitled "Observations on the Admeasurement of Tonnage," drawn up by the aforesaid Marine Secretary, Mr. Thomas Gray, C.B., was issued by

the Board of Trade, and presented for the consideration of other maritime countries, showing, among other things, the fallacies of the "British Rule," and recommending the adoption of a Rule by which the cubic contents of the herein-mentioned spaces (bunkers included) could be ascertained.

In consequence hereof, in 1871, a Tonnage Bill was laid before the Parliament, by which it was moved to introduce the later so-called "German Rule" (*i.e.*, the deduction for the propelling power in steamers fixed by cubical measurement of all spaces occupied by or necessary for the engine, boilers, and shaft-trunk, as well as of the permanent coal-bunkers), but this Bill was not passed.

It was also England which caused the appointment of the International Tonnage Commission of Constantinople, 1873. The proposals of this Commission were looked forward to with great expectation as likely to be conducing to an agreement about the establishment of a universal tonnage measurement, but these expectations have only been partly fulfilled. The debates and the proposals of this Commission are inserted in a voluminous Memorandum (*procès-verbaux*) issued by the Turkish Ministry of Foreign Affairs in December 1873, but how interesting this work may be in a scientific point of view, nevertheless, the proposals founded thereon have, as it seems, a good deal to be wished for as to their usefulness in a practical point of view.

However, as a result hereof, and in accordance with the proposals of the above-named Committee of 1874, in the same year a new Tonnage Bill was presented where it was moved to introduce the Rule recommended by the said Commission, namely, the "Danube Rule" (*i.e.*, the deduction fixed by cubic measurement of all spaces occupied by or necessary for the engine, boilers, and shaft-trunk, with an addition of 75 per cent. thereof as amends for the coal-bunkers not being measured). Nor was this motion carried either, because the Parliamentary Commission, which had to examine the same, had given it such form as the Government could not approve.

Again, in 1880, a Royal Commission of Tonnage was appointed, whose painstaking labours are laid down in an exceedingly clear and concise Report (with a voluminous "Minutes of Evidence"), dated the 25th August, 1881 (Parliamentary Paper, C. No. 3074, 1881).

On the deduction for propelling power in steamers, this Commission says:—

"As regards the operation of the law in respect of the deduction of space in steamers for propelling power, we find a general concurrence of opinion that the existing allowances are neither equal in their operation, nor based on any sound principle discernible under the present conditions of steam navigation."

This opinion was backed up by some very lucid Tables. The proposal in this respect was that the owners of steamers should have the option to claim as deduction for propelling power either the application of the "Danube Rule" or the "German Rule," but with the provision that this deduction in screw-steamers should not exceed 33 per cent., and in paddle-steamers 50 per cent., of the gross tonnage. On the base of this Report, a Tonnage Bill was, in the beginning of 1884, presented, but was soon withdrawn by the Government, and has not as yet again been laid before the Parliament.

Nevertheless, the requirements of the Danube Commission and the difficulties with the Suez Canal Company made it impossible for England to leave this matter alone, and by a Convention, dated 5th February, 1878, the proposals of the Constantinople Commission became obligatory for the Company.

In accordance with this arrangement there are also issued special certificates of tonnage for the Suez Canal, in which the deduction is ascertained by the "Danube Rule," the formula hereto being adopted by all maritime countries. Herein it may be hoped that the germ to an international tonnage certificate is to be found.

We think it must be admitted that it cannot with justice be said that the Board of Trade has failed in its calling in this matter, but that the fault is to be found in the British Parliamentary system.

When it is considered how the English experts as shown above have treated their own Measurement Rules for the deduction for propelling power, it is not to be wondered at that these Rules have not fared better in other countries. Nevertheless, some of these—for practical reasons, and, namely, to be in full accordance with the mightiest Maritime Power—have adopted the "British Rule;" several chose to follow the "German Rule," introduced by Germany by its "Schiffsvermessungs-Ordnung vom 5. Juli, 1872, §§ 16 und 17" (see Appendix, Note 7); and the rest adopted the "Danube Rule."

At present the situation is as follows:—

1. The "British Rule" is the legal rule in English, French, Finnish, Italian, and Austro-Hungarian ports;

2. The "German Rule" is the legal rule in German, Swedish, Norwegian, Russian, and Belgian ports;

3. The "Danube Rule" is the legal rule in North American (United States), Danish, Dutch, Egyptian, Greek, and Spanish ports, as well as for the passage of the Suez Canal and the River Danube.

The reasons why the last-named Rule is recommended by the experts are:—

(*a.*) That it was already introduced by "The Merchant Shipping Act, 1854," Article 23 (*b*), and therefore must be said to be well known, though not often used in practice;

(*b.*) That the deduction according to this Rule is so ample that very seldom any steamer will suffer from its application;

(*c.*) That by its application no opportunity is given for the inquiries which are necessary by the application of the "German Rule" as to what may be considered as permanent or not permanent bunkers, and which makes the last-named Rule so obnoxious both to owners, masters, and surveyors. (See Appendix, Note 7.)

One drawback to the "Danube Rule" must not be left unmentioned here. As well known, great iron houses are as a rule built on the upper deck to give protection to the proper engine-room, and for the admission of light and air. In case of such houses not forming a part of, and not being inclosed in other erections, they are not measured at all, but if not so built, it is the rule that they are considered as belonging to the engine-room under the upper deck, and their tonnage augmented with 75 per cent.

in like manner as the tonnage of the proper engine-room. But by such proceeding a disposition is created to increase the size of such deck engine-houses beyond what is necessary or expedient, and a way is thus opened to a fatal misuse of the "Danube Rule." To prevent such abuse, it is evident that only the actual tonnage of the engine-house on deck, as included in the gross tonnage, ought in such cases to be added to the engine-room deduction, and not, as the "Danube Rule" at present prescribes, also with 75 per cent. of such a separate partitioned-off space on the upper deck or betwixt-decks in addition.

Finally, we are of opinion that the recommendation of the British Royal Commission, that the deduction for propelling power shall not exceed 33 per cent. of the gross tonnage of any screw-steamer, in some cases will be rather too narrow. The bad effects of the present deficiency in the "British Rule" of any limitation at all has been amply represented before, as it may lead to the absurd result that the net tonnage can be reduced to *nil*.

In the United States, Denmark, Germany, Norway, and Russia this limit is therefore fixed at 50 per cent. of the gross tonnage; but with such a deduction, in addition to the deduction for crew spaces, no injustice can be said to be done to any steamer, while at the same time any misuse is prevented.

As the net registered tonnage for steamers above 1,000 tons gross, estimated under the "British Rule," is on the average about 10 per cent. less then the same tonnage according to the "Danube Rule," and about 16 per cent. less than after the "German Rule," there exists at present a deplorable inequality as to the international norm for the calculation of the dues on steam-shipping. The advantages of an international register tonnage are therefore for a great deal lost, as, of course, net register tonnage, after the "British Rule," is not recognized in countries having adopted either the "Danube" or the "German Rule." Originally, in the Agreements concluded about the recognition of the tonnage measurements, no notice is taken of the varieties in the modes of measurement and in the deduction for the propelling power in steamers.

In the later Agreements a change has taken place in that respect, and generally it has been determined that only the gross tonnage for steamers shall be recognized, and the engine-room deduction in every special case shall be determined according to the Rules in force in the respective countries. Partial remeasurements were accordingly reintroduced, carrying with them the former loss of time and other troubles, though, of course, in a diminished degree

On the other side, where the "British Rule" is the norm, reduction, by remeasurement, to this Rule from the "German" or the "Danube Rule" is allowed. Although it cannot be denied that such an arrangement is quite correct, experience, however, has shown that it is not much made use of, on account of either ignorance or fear of detention.

In order to prevent the drawbacks of such partial remeasurements, the tonnage certificates issued in Denmark since the 1st October, 1878, besides the tonnage computed after the "Danube Rule," have, under a special head, been provided with the officially recorded tonnage details, according to the two other Rules.

The same arrangement has also been adopted in Sweden and Norway, and as such statements, according to special agreements, respectively, are taken for good in most countries, no remeasurement takes place, and, consequently, the inconveniences of the different methods are not so much felt by steamers belonging to these countries.

But, besides the above described difference as to the deduction for the propelling power, there exist several other discrepancies, which exercise a more or less disturbing influence on the size of the respective registered tonnage. One of these is:—

"Deduction for Spaces for the accommodation and use of the Crew."

Concerning the deduction for separately partitioned-off spaces for the accommodation and use of the ship's officers and crew, there are at present three systems in operation, viz.:—

1. The "English Rule," according to "The Merchant Shipping Act Amendment Act, 1867," Article 9, by which—under certain conditions as to arrangements and size in respect to the number of the crew—such deduction is allowed with the full-measured tonnage of said spaces, without any limitation whatever.

Besides in Great Britain, this Rule is followed in Sweden and Norway.

2. The "German Rule," according to "Schiffsvermessungs-Ordnung," 5th July, 1872, sections 11 and 15, whereby the total deduction for crew-spaces must not surpass 5 per cent. of the gross tonnage. (See Appendix, Note 7.)

Navigation spaces, as well as cook-houses and privies, are considered as not belonging to the crew spaces, and are, in general, left out of consideration altogether.

This Rule is adopted in Russia and Austria-Hungary.

3. The International (Constantinople) Tonnage Commission's, or the "Danube Rule," according to which the total deduction for crew-spaces also must not surpass 5 per cent. of the gross tonnage, but with the difference that navigation-spaces as well as cook-houses and privies are here considered as belonging to the crew-spaces, and therefore are added to these and limited as above mentioned. No conditions as to size or arrangement in respect to the number of the crew are made here.

This Rule is adopted by the United States, France, Holland, Belgium, Spain, and Greece, as well as by the Danube Commission and Suez Canal Company.

In Denmark this Rule is also followed, but only for ships above 1,000 tons gross. In every case the conditions as to size and arrangement, according to the above-named "Merchant Shipping Act, 1867," Article 9, are strictly enforced. For vessels with a gross tonnage below 1,000 tons a per cent. deduction, rising in an inverse proportion to the ship's size, is allowed, as it has been proved by numerous

measurements of crew-spaces that a limitation of 5 per cent. for smaller vessels is unjustifiably little provided that the sanitary regulations shall be duly attended to. Experience has also shown that the deduction for navigation-spaces, cook-houses, &c., ought to have special limitations, and, consequently, not, as according to the "Danube Rule," to be included in the deductions for crew-spaces. As well known, the number of crew, and, consequently, the size of the crew-space do not increase in the same proportion as the size of the vessel. For instance, while the crew of a sailing-ship of 50 tons, as a rule, consists, besides the master, of three men, the crew of a sailing-ship of 500 tons does not number thirty, but, in general, only fifteen men. Consequently, for the first-named ship, according to the "Danube Rule" a deduction of only 0·8 ton for each man will be allowed, while, on the contrary, for the latter a deduction of 1·7 ton for each man will be allowed, that is to say, more than the double; this disposition cannot, however, be said to be proportionate or equitable; the reverse ought obviously rather to be the case.

In order to prevent the misuse, caused by an unlimited deduction, a certain limitation is unavoidably necessary, and as no plan more practical has been proposed, the only expedient left seems to be, as it is done in the following Table, to adopt a deduction increasing in an inverse proportion to the size of the ships, and this deduction ought to be so ample that each ship may, as far as possible, be indemnified for the space which, in general, is required or appropriated for the accommodation of the crew answering to the size of the ship; moreover, the deduction ought to be so adjusted that the Regulations with respect to the spaciousness of the forecastle should not be counteracted by the Tonnage Measurement Rules as to the limitation of the deductions.

In England, as in Denmark, it is, namely, prescribed that for each man who is to be accommodated in the crew-spaces shall be allotted a space the cubic content of which must be 0·72 ton, at least. The maintenance of this requirement—which is as moderate as well may be, as, for instance, can be seen by the circumstance that in barracks a minimum space about five times as large is required for each man—would be rendered highly difficult by too narrow limitations. The circumstance that the ship's owner knows that the whole space allotted for the accommodation and use of the crew is not included in the dutiable net tonnage will evidently contribute exceedingly much to a satisfactory solution of the question in hand. In a time when the attention is more and more turned to the unsatisfactory sanitary conditions existing on board many vessels, it seems unadvisable to prescribe too narrow Rules with regard to measure and duty-free crew-spaces. (See Appendix, Note 7.)

The following Table shows how this problem has been solved in Denmark, and we hope the Congress will be good enough also to look into this side of the intricate tonnage measurement question. At the first glance this Table probably will look rather complicated, but ten years' experience has shown that it works very well, and that the augmented reckoning caused thereby is next to nothing in relation to all the other tonnage computations:—

Gross Tonnage.	The Deduction for all Crew Spaces must not exceed—	The Deduction for all Navigation Spaces must not exceed—
For ships above 1,000 tons	The total deduction must not exceed 5 per cent. of the gross tonnage.	
„ from 1,000–500 tons	6 per cent. of the gross tonnage .. .. . The total deduction must not exceed 50 tons.	1 per cent. of gross tonnage .
„ „ 500–300 „	7 per cent. of gross tonnage and not over 30 tons ..	5 tons.
„ „ 300–200 „	8 „ „ „ 21 „ ..	4 „
„ „ 200–100 „	9 „ „ „ 16 „ ..	3 „
„ „ 100– 50 „	10 „ „ „ 9 „ ..	2 „
„ „ 50– 30 „	11 „ „ „ 5 „ ..	2 „
„ „ 30– 10 „	14 „ „ „ 3·3 „ ..	1 „
„ under 10 tons..	18 „ „ „ 1·4 „ ..	

As the size of the crew-spaces varies between 3 or 10 per cent. of the ship's gross tonnage, corresponding inequalities are created as to the norm for the dues on shipping. A consequence hereof is again that the countries which have adopted the 5 per cent. limitation are suffering under a corresponding pregravation in comparison with the countries which allow deductions for crew-spaces without any limitation at all; an inequality which is contrary to the Agreements concluded, and which could easily be prevented.

As little as the net registered tonnage, on account of the above-named deductions for propelling power and crew-spaces, can at present be considered to be in a satisfactory state as to equality, as little the gross registered tonnage is identical for vessels under different flags having one or more of the following special constructions:—

"Incomplete covered or closed-in deck shelter-spaces."

The said British Royal Commission recommends in its Report (see paragraph 44 (*d*)):—

"That gross tonnage should be made to include all permanently covered and closed-in spaces above the uppermost deck, and that erections with openings either on deck, or coverings, or partitions that can readily be closed in, should also be included in gross tonnage, but that skylights of saloons, booby-hatches for the crew, light-and-air spaces for the boiler- and engine-rooms when situated above the uppermost deck, as well as erections for the purposes of shelter, such as turtle-backs, open at one end, and light decks supported on pillars and uninclosed, should not be measured for the purpose of their contents forming part either of the gross or register tonnage. Cargo carried under such erections should continue to be measured for dues, under the Act of 1876, the same as if stowed on the open deck."

In a theoretical point of view it is just, and in accordance with the Moorsom system, to include, as

proposed by the Commission, in the dutiable tonnage all permanent spaces on or above the uppermost deck, regardless of these spaces being but incompletely closed in, in as far as the actual openings of those spaces can be closed or choked.

In most countries—at all events in countries whose steamers have a lively business in carrying deck passengers and live cattle—it has, however, practically been found impossible to work upon this principle, as by this means necessary contrivances to shelter passengers and cattle, when on deck, against shipment of seas and inclemency of the weather would be hindered, and, at the same time, the proper means to secure life and property at sea be counteracted.

That scarcely any other question relating to tonnage measurement has given rise to so much dispute as this highly difficult question will be seen by the following outline of its history.

In default of English Rules in this respect, officially advertized, a number of examinations on board English steam-ships has been undertaken in Danish ports, by which it has been found that the English Measurement Surveyors up to 1875 practically have adopted the plan that when "any part of the deck below the shelter-deck was not covered in, then the shelter-deck spaces were not measured; and, on the contrary, when the shelter-deck was unbroken and continuous, then the shelter-deck spaces were always measured."

How favourable soever such a distinction really was to the steam-ship owners, it did not satisfy them, and the question was therefore, in 1872, brought before the English Courts of Justice for decision, whereby, nevertheless, the above-mentioned mode of proceeding seems to have been reversed; but whereby also a deplorable confusion in this question was created, which will be seen by a Board of Trade Circular, No. 28, July 1875, communicating the Judgment of the House of Lords in the case of the steam-ship "Bear," and showing its consequences.

It appears therefrom that the attempts to settle the question in administrative way have failed, and that it therefore will be necessary to judge and treat every case according to its special qualities. However, as it cannot with certainty be seen from the said Circular what the mode of proceeding ought to be, this vagueness has led to a very unsatisfactory state of things, the lamentable consequences of which, on account of the importance of the question, are more or less felt by all countries that have adopted the Moorsom system.

By examination of a great number of English steam-ships, however, it has been found that, according to the English praxis, the following two conditions for exemption were at first required, viz.:—

"1. That the shelter- or covering-deck should be broken through by complete transversal intersections; and

"2. That on or above the shelter-deck should not be placed such heavy apparatuses as steam-cranes and capstans for the unloading of cargo or weighing of the ship, nor permanent deck-houses for passengers or crew."

To the former condition it is, as it seems with good reason, objected that by such intersections the strength of the upper part of the ship will be considerably weakened without it being prevented; that the condition may be rendered illusory if the said openings, immediately after the measurement has taken place, shall be covered or closed in by planks from above and by ports on the sides, which, by means of caulking and screw-bolts, can be made almost completely water-tight.

Of the latter condition complaints have likewise been made on account of several disastrous accidents having been caused thereby, as in case of the unloading or weighing apparatuses being placed under the shelter-deck it will be impossible for the man working these apparatuses to have the necessary control with what is going on about him.

The consequence of these remonstrations has been that these conditions could not be maintained, and as the Board of Trade have not yet succeeded in carrying through any of the Bills which they have repeatedly laid before the Parliament in this respect, this question is in a highly unsatisfactory state, and as no Rules generally valid and suitable to the purpose exist, the practical treatment is different in the different countries. In consequence of the lively Anglo-Danish maritime intercourse Denmark follows the English practice at any time as near as possible, but in Sweden, and particularly in Norway, the conditions for exemption of deck-shelter spaces are more severe; in Germany they seem, in certain respects, to be treated somewhat easier (see Appendix, Note 7); but dissimilarities as high as from 10 to 30 per cent. of the gross tonnage are hereby created between steamers under different flags; nevertheless, their net registered tonnage is usually taken for good in pursuance of the wording of the Agreements.

The Board of Trade has, however, as soon as possible taken care to neutralize the noxious effect that necessarily must be the consequence of the above-mentioned decision pronounced by the English Supreme Court by inserting in "The Merchant Shipping Act, 1876," section 23, the following preventive Regulation:—

"If any ship, British or foreign, other than home-trade ship, carries as deck cargo, that is to say, in any uncovered space not included in the cubical content forming the ship's registered tonnage, timber, stores, and other goods, all dues payable on the ship's tonnage shall be payable as if there were added to the ship's registered tonnage the tonnage of the space occupied by such goods at the time at which such dues became payable."

It is easy to see that by this Regulation not only the construction of imperfect and less seaworthy shelter-decks, but also the increasing, and in many instances dangerous, carrying of deck cargo is counteracted, as no real profit is to be gained thereby, and the temptation to elude the Tonnage Measurement Law in this manner is, therefore, as far as concerns Great Britain, almost done away with.

Sure enough, in the end of the year 1876, the British Government sent an invitation to the Maritime Powers which had adopted the Moorsom system to introduce the above-mentioned Rule as to measurement of deck cargoes, contending that this provision ought to be regarded as an appendix to that system, and in such a manner that the deck cargoes in foreign vessels should be measured in the

loading ports, and that the measured tonnage should be proved by the issuing of an official special tonnage certificate in every case, but, as far as it is known, none of the said countries has, as yet, followed this invitation, and it must also be admitted that this proposal is connected with several practical difficulties.

Also, this important tonnage question is therefore waiting for its solution by the herein-proposed "International Permanent Merchant Shipping Commission."

"Double bottom water ballast arrangements."

To the other pending tonnage questions is lately added one more, namely, whether the water-ballast space in the double bottom should or should not be exempted in all cases, howsoever it may be constructed. The reasons for the wishes as to such exemption are known to be: That it is not freight-earning space, that cargo cannot be carried in it, that the double bottom is a source of strength and safety, that vessels have been saved from foundering through being so built, that in the case of heavy cargoes it is found advantageous by raising the weight, and that vessels so constructed do not require dock or harbour facilities for loading and unloading ballast.

On the other side it is argued that, although double-bottom spaces may not be used for the stowage of cargo, they often practically contribute to freight-earning, inasmuch as the entire hold in such case is available for light cargo, whereas a portion of the hold in a ship not fitted with water-ballast would be unremuneratively occupied by stone or other material for ballast. It is also manifest that a ship fitted with a double bottom on the bracket or cellular system is externally a larger ship and is capable of carrying more dead-weight cargo, with a given freeboard, than a ship of the same internal dimensions, and of precisely the same tonnage, constructed without a double bottom, or with double bottom water-ballast on the McIntyre system, and lastly, that this wished-for exemption is contrary to the principle governing the Moorsom system.

In view of these different opinions no hard and fast rule has, as yet, been laid down in any country, but meanwhile in England, Sweden, and Denmark the practice has grown up that such spaces are not only exempted in cases where the double bottom is constructed on the "cellular" (the bracket or longitudinal) system, that is, where the the floor plates form the upper bottom, and where this bottom is hermetically closed and continuously running fore and aft, but in Germany it seems that water-ballast spaces between the double bottom are exempted without any condition whatever. (See Appendix, Note 7.)

We are inclined to think that the last rule is better than the first one, as this may lead to anomalies and complaints from ship-builders and others interested. If to the last rule were added that the deduction should only be given with 50 per cent. of the tonnage of such spaces, we think that the opposite meanings might be somewhat reconciled. Such inequality in the treatment is, of course, unfortunate, as it may lead to differences in the respective gross tonnage of from 5 to 10 per cent. As the Board of Trade does not see its way to take the lead this question is also waiting for an international solution.

"Measurement of hatchways."

It has appeared by experience, besides the many attempts that have been made to elude the Moorsom system, that it has been contrived to fit up not to be measured holds in large hatchways. As thereby the seaworthiness of the ship is diminished, partly with regard to the strength of the deck and the whole structure, partly with regard to the stiffness of the ship, the Board of Trade, to prevent such misuse, in September 1876 issued a Measurement Circular, which prescribes that hatchways of whatever height are to be measured, "in order that the proportion their tonnage bears to the gross tonnage of the ship may be ascertained, and that the excess, if any, above ½ per cent. of such gross tonnage may be added to the register tonnage of the vessel."

This example was from 1878 followed in Denmark, but as this does not appear to be the case in several other countries, the consequence is one more, though comparatively insignificant, difference in the respective gross tonnage.

As shown in the statements above, the net registered tonnage for screw-steamers built according to the same design with quite the same external dimensions, measured in the harbours of the various countries, may vary on account of—

1. The different Rules for the deduction for the propelling power with until 16 per cent. of the net registered tonnage;
2. The different Rules for the deduction for crew-spaces with until 5 per cent. of that tonnage;
3. The different treatment of deck-shelter spaces with until 25 per cent. of the gross registered tonnage;
4. The different treatment of water-ballast spaces in double bottom with until 5 per cent. of that tonnage.

Accordingly, the difference altogether may be for screw-steamers until 50 per cent., and this, notwithstanding the Moorsom system, forms the common principle for the tonnage-measurement in the respective harbours.

As before said, the censure for the unsatisfactory state, seen from an international standpoint, of the "Tonnage Rules" as well as of the "Rule of the Road," cannot with justice be brought home to the Board of Trade, as it has been shown that this overburdened Department again and again has presented to the British Parliament Bills for the development and improvement of the said Rules, but such Bills are constantly wrecked there, as the Government, as before mentioned, have not been able to break the obstinate resistance which the influential ship-owner party raises against every proposal which is thought to touch at this party's pecuniary interests, without the least regard being paid to International Agreements.

"In view of this state of things we are decidedly of opinion that this important question will never find its solution without being drawn in under the auspices of an 'International Permanent Merchant Shipping Commission.'"

(D.)—"*Miscellaneous Maritime Agreements.*"

Under this partition may be noted some practical Agreements, which owe their existence to the interest England has taken to their international adoption, viz.:—

1. Reciprocal arrangements as to the disposal of the estates of deceased seamen;
2. Agreements as to the reciprocal surrender of deserted seamen from merchant-vessels;
3. Reciprocal arrangements as to the relief of distressed seamen in certain cases;
4. Reciprocal Agreements concluded in pursuance of "The Merchant Seamen (Payment of Wages and Rating) Act, 1880," Article 5, to prevent "unauthorized boarding of ships." By these Agreements the evil influence caused by the presence of "boarding-masters" and their "runners" on board arriving ships, in order to induce the crew to desertion, has been counteracted in a very effective way;

5.—(*a.*) The International Convention relative to the police of the fisheries in the North Sea, dated the Hague, the 6th May, 1882;

(*b.*) The International Convention respecting the liquor traffic in the North Sea, dated the Hague, the 16th November, 1887.

The deliverance to the care of an "International Permanent Merchant Shipping Commission" of questions relating to such practical reciprocal Agreements, would, no doubt, be received with thankfulness from all parties concerned.

Division 2.

Under this division are treated the following Merchant Shipping Laws and Regulations, in the adoption of which by the other Maritime States Great Britain has taken an interest, which, as yet, to our regret, has been met with but too slight adherence.

(E.)—"*Official Wreck Inquiries.*"

In this important matter England has also been the true leader, having got her eminent system for such inquiries introduced as early as in 1854 ("Merchant Shipping Act, 1854," Part VIII), which was further improved and completed by a series of Amendment Acts of 1855, 1862, 1873, and 1876, as well as by "The Shipping Casualties Investigation Act, 1879."

These inquiries of casualties at sea have been of great service to the whole maritime world, partly as a lesson or a warning to the sailors, and partly as constituting the fundament for the development of the newest side of the merchant shipping legislation, and especially in respect to prevention of the use of unseaworthy ships. At first there was a good deal of opposition against these Laws by some maritime circles and Ship-masters' Societies, but this was little by little silenced when, by the information contained in the Reports, the benefits were known which could be reopened from such inquiries when they are led and published by experts.*

England has therefore several times invited the other maritime countries to adopt her system in order to procure uniform informations, by specified formulas, for the different classes of casualties occurring on the coasts of the various countries, but this well-founded invitation has, on the whole, not been met with the adherence it deserved.

In the Scandinavian countries already, in 1876, Commissions were appointed to consider and report on the English system, and in Denmark Bills, based on her Commission's proposals, were presented three times to the Rigsdag (the last time in 1883), but none of these Bills were passed.

On the contrary, it must be admitted that Germany, by its "Reichsgesetz vom 27. Juli, 1877, betreffend die Untersuchung von Seeunfällen," has got introduced a most excellent system in this respect, which can be learned by the perusal of the "Entscheidungen des Ober-Seeamts und der Seeämter des deutschen Reichs," published yearly by the "Reichsamt des Innern."†

Acknowledging the usefulness of such inquiries, the first Scandinavian Maritime Conference (of 1883) discussed this matter, and the following Resolution was unanimously carried:—

"The Conference find it advantageous for the sea-trade—

"1. That the circumstances by all accidents at sea, which have led to loss of property of greater consequence, or have caused loss of life, should be the object of an official inquiry by experts.

"2. That by such inquiries in the three Northern Kingdoms, as soon as possible after the casualty, there ought to be drawn up as far as possible uniform statements as to the details of such casualty.

"3. That the statements should be statistically treated by the proper Departments, and the results published."

In the Report of the twelfth Conference (in 1881) of the Association for the Reform and Codification of the Law of Nations, we find that the following Resolutions were carried as to "Official Investigations of Maritime Casualties":—

"1. That this Association deems it advisable that the results arrived at by the competent

* In a work entitled "Wreck Inquiries," by Walter Murton, Esq., Solicitor to the Board of Trade, published in 1881, is given a most complete information of the whole machinery of these inquiries, and which, in the English maritime press, has got the very best reception, as indispensable for every one who has to do with Law Court cases of shipping casualties.

† A very clear and concise statement of the German system is represented in a work by "Statsanwalt" (Julius Cæsar), entitled, "Handbuch der deutschen Reichsgesetzgebung betreffend die seeunfälle, deren Untersuchung und Verhütung" (Bremen, 1882).

authorities in the investigation of maritime casualties, if of general interest, be communicated between the respective Governments.

"2. That this Association deems it advisable that the authorities intrusted with the investigation of maritime casualties, if empowered to deprive the masters of their certificates, ought also to be allowed a discretion to suspend only the certificate for a certain limited time."

While in principle agreeing with the above Resolutions, we are decidedly of opinion that their aim will not, in a discernible future, be attained without this important matter being taken in hand by the herein-proposed Commission.

(F.)—"*Official Survey as to the Seaworthiness of Merchant Vessels.*"

The Regulations in this respect must, according to their nature, be said to be of an international character in so far as a country, which has introduced severe controlling provisions as to seaworthiness of her own vessels for the case of competition, must be anxious to know that other maritime countries have introduced similar provisions for their vessels. This seems to be the natural explanation why England has shown so great an interest for getting her legislation in this respect, and particularly the provisions in "The Merchant Shipping Act, 1876," Article 13, respecting an official load-line, accepted in other countries.

In consequence of suggestions from England in this respect to the Scandinavian countries, Commissions were appointed there (in 1876) to inquire into and report on the English system of survey of merchant-ships by Government officials.

In Denmark Bills founded on her Commission's Report were presented to the Rigsdag in the years 1880, 1881, and 1883, but were not passed, the principal cause being that in none of the surrounding countries any serious interest for the introduction of the English system was shown.

After the British Load-Line Committee of 1883 in the beginning of 1885 had submitted its Report on this matter to the Board of Trade, this Department, in the spring of 1886, renewed their invitation to the other maritime countries as to an international adoption of the proposals of the Committee with regard to the fixing of an official load-line.

In April 1887 the British Government has further notified to foreign Governments that clauses 13 and 24 of "The Merchant Shipping Act, 1876," which have heretofore been in abeyance, are now to be applied to foreign vessels. Clause 13 provides that, subject to certain modifications, the Board of Trade shall have power to prevent the overloading of foreign vessels which may load in whole or in part in British ports. Clause 24 prohibits all vessels, whether British or foreign, from carrying into British ports deck cargoes of heavy timber during the winter months. The effect of this new Regulation will be that in respect to vessels loading in British ports, and vessels arriving with deck cargoes of timber at British ports, the same Rules will be applied to foreign vessels which have hitherto applied to British vessels only. Of course, this will remove a grievance of which British ship-owners have complained, that they had to compete with foreigners who were left without restrictions as to the quantity of cargo they might carry. From a Continental stand-point this provision has, however, its great drawbacks, as it, without adherence from other countries, may be cause of serious protests, international difficulties, and endless correspondence; but, of course, everything will depend on the manner in which this provision is carried through in practice. As far as we know it has, as yet, been enforced with great moderation.

We believe that it is a general opinion in the small maritime countries that the English system of survey is too complicated, and would be too costly, also that it is not so necessary in such countries, where, of course, the shipping affairs are more uniform and quiet, and where the ship-owners may be said to be living in glass houses, and are therefore controlling each other, so that Government interference is not so much needed. Nevertheless, we are inclined to think that some control—on the principles laid down by "The Merchant Shipping Act, 1876," and "The Merchant Shipping (Carriage of Grain) Act, 1880," ought to be introduced, particularly in respect to the loading of vessels; but as long as Germany and Russia will not move, there seems to be very little probability that the Scandinavian countries will take the lead in this matter.

In our opinion, there is also a right stand-point as to the question of surveys for seaworthiness by Government officials, as this preventive matter is a true international question which only can be solved by an International Commission, as proposed by the Conference.

In this opinion we are glad to see that we are in the very best accordance with the British Royal Commission on Loss of Life and Property at Sea (see Final Report, dated the 27th August, 1887, Parliamentary Paper C. 5227, 1887), which, with regard to the loading and seaworthiness of foreign vessel, reports: "We think that the Board of Trade has acted wisely in endeavouring to secure by negotiation that the same measures shall be applied to foreign vessels by their own Governments and local authorities, rather than by attempting to enforce our Regulations upon foreign vessels.

"We recommend, therefore, that Her Majesty's Government should take immediate steps to invite a Conference of Maritime States to consider how far it may be possible to agree on identical Rules for the loading of merchant-vessels, and also what measures can be mutually agreed on for enforcing such Regulations."

(G.)—"*Agreements for preventing the Transfer of Unseaworthy Vessels to the Flags of other Nations.*"

An arrangement intimately connected with the foregoing question, which has been very effective in aiding the Board of Trade in its endeavours to prevent the use of unseaworthy vessels, has been attained by the above-named Agreements, which that Department has carried through with success and impartiality.

According to these Agreements no British ship can be transferred to another flag before a certificate of survey upon the condition of the vessel in question, showing that no objection exists on the grounds of unseaworthiness to the transfer, has been issued by a Board of Trade Surveyor, and has been presented to the Consuls of the respective countries.

At the same time, as fraudulent or colourable transfers are hereby counteracted, such maritime countries as have not got introduced provisions against the use of unseaworthy vessels, have escaped the danger of being overrun by such vessels heretofore under the English flag.

Similar Agreements might also with advantage, as to the security of life and property at sea, be concluded between other maritime countries.

(H.)—"*Uniform Marking and Lettering of Names of Ships, Port of Registry, Register Tonnage, and Draught Scale of Feet.*"

In this respect the Board of Trade has recommended the universal adoption of the Rules according to "The Merchant Shipping Act, 1873," Article 13, as to the above-named marking, after which the name shall be marked on each of the ship's bows, and her name and the name of her port of registry on the stern. The last prescription is generally enforced in most countries, but not the first, which, nevertheless, must be said to be very useful for the better control with a ship's whereabouts. In addition hereto the number denoting her registered tonnage shall be cut in on her mainbeam, and a scale of English feet denoting the ship's draught of water shall be marked on each side of her stem and of her stern-post. As there is no probability that England will give up her feet-measure, while, on the other side, most countries have adopted the metre-measure, we think it advisable that the ship's draught should be marked by both these unities of measure, and that a record of the draught of water of any sea-going ship, as well as the extent of her clear-side, when leaving port, should always be noted in the log-book.

The marks of nationality on the mainbeam, which a few countries (for instance, the Scandinavian) still retain, we think had better be left out, as such marking has never been universally adopted, and the certificate of registry ought to be considered sufficient to prove the nationality and identity of a vessel.

Also this matter would be better off if taken care of by the said Commission

(J.)—"*Uniform Conditions as to the Right to carry the National Flag.*"

It is a well-known fact that the legislation in some maritime countries as to these conditions is so elastical that foreigners very easily can get their ships transferred to the registers of such countries, and as such irregularity under a naval war may lead to complications of a dangerous character for the neutral Powers, it seems to us that some uniform fundamental Rules in this respect would be very useful. Though the British Rules, according to "The Merchant Shipping Act, 1854," Part II, Article 18, "Description and Ownership of British Ships," generally have been adopted as the pattern, nevertheless these Rules in other countries have been more or less changed, but, generally, not for the better. It would carry us too far to point out such deviations in detail for every country, and we admit that it is a most difficult task to formulate these Rules in such a manner that they cannot be eluded either by *pro formâ* bills of sale and secret not registered mortgages, or by the starting of share Companies with men of straw as managers. However, we think that something ought to be done in this respect, but also that the only institution that could solve this problem would be the proposed International Commission. The same remarks are valid for the form and contents of the certificates of registry in the different countries, which will be evident by a look into the valuable collection of such papers, which the British Board of Admiralty has published in May 1886. Some of them are curiously unpractical as to the information most needed, and where no measurement bill is included, give very little enlightment as to the controlling of the dutiable register tonnage. In our opinion there ought to be an international agreement in this respect, prescribing that the spaces above the uppermost deck that are measured into gross tonnage should be specified with their contents on the certificates of registry or measurement bills, and that the spaces whose contents are deducted from gross tonnage should in like manner be specified on these papers. Though it might be useful, it will not be necessary that the registry machinery should be the same in every country, it would nevertheless, for the lightening and security of purchase and sale of shipping property, be desirable that the most important deeds of property, as the bill of sale and the builder's certificate, should be made more alike as to form and content.

In the transactions of the Antwerp Congress of 1885 will be found a proposal of M. Smekens, President of a Belgian Tribunal of Commerce, as to uniform provisions for registration of mortgage of ships, &c., and partly for the form and content of the registers, which, in our opinion, is very noteworthy. In the Scandinavian countries Special Commissions have lately prepared new registry bills, which, to all practical purposes, are quite alike.

It would certainly not be amiss if also these questions were to be taken care of by the said Commission.

(K.)—"*Uniform Conditions respecting the Qualifications for the acquirement of Master's, Mate's, and Engineer's Certificates of Competency.*"

Although the safe and successful carriage of passengers and property in the oversea or the foreign trade mainly depends on the same qualifications as to skill and knowledge of the officers of

whatever nation it may be, we are not aware that any serious step has been made by the British Government, or any other Government, in order to establish certain uniform fundamental provisions in the above-named respect. Nevertheless, most of the Continental Regulations, as the German "Bekanntmachung" of 25th September, 1869, the Swedish Decree of 22nd November, 1878, and the Dutch Decree of 18th January, 1886, bear witness that the British Regulations as to the examination of masters, mates, and engineers—according to the Merchant Shipping Acts, 1854, Articles 131-140, and 1862, Articles 5-11, together with the Board of Trade's Regulations of 1868 and later Circulars—have been adopted as a pattern, though not sufficient to be considered as being uniform, but as it would only be waste of time and space here to point out in detail the existing divergences, particularly as to the conditions for the age and the time served at sea of the applicants, we must confine us to express a hope that at least these conditions should be made similar, as well as the Regulations for the admission of foreigners to command and pilot vessels. The British Regulations in the last-named respect are the most liberal known, as a sailor of whatever nationality, who fulfils the English requirements, can command a British ship and pilot such ship or a foreign ship, even in British compulsory waters. These liberal Regulations we should be glad to see internationally adopted. Certainly, by the Merchant Shipping Bill laid before Parliament in 1887, it was proposed to take away from the masters and mates of foreign ships the privilege of proving their competency to pilot their own ships, and thus obtaining a certificate which exempts them from compulsory pilotage; but as the 'Select Committee on Pilotage,' in their Report, dated 3rd August, 1888, recommend that the granting of pilotage certificates to aliens should be continued, it is probable that the above-named truly British Regulations will not be allowed to be interfered with.

(L.)—"*General Uniform System of Buoyage.*"

The Report of the Committee delegated by the Conference, which, under the presidency of the Duke of Edinburgh, in 1882, was held upon a proposal to establish such a system (see Parliamentary Paper C. 3622, 1883), contains in its minutes of evidence a series of opinions from experts in favour of an international system of beaconage and buoyage as a valuable assistance to the navigator, which, therefore, would prove a benefit to the shipping. One member of the Commission proposed a system for the marking of shoals based on the compass bearings to be shown by different variations in the colourings of the buoys.

As, however, the colours very often are difficult to discern at a distance, several inventors have tried to solve the problem by a combination of different forms and colours of the sea-marks.

In "Annalen der Hydrographie," 1887, such system will be found, entitled "Einheitliche Betonnungs-System unter besonderer Berücksichtigung des Deutschen Betonnungs-Systems."

In the Appendix, under Note 8, we propose to give a short outline of an international system proposed by a Danish expert, who has lately published an interesting book, with numerous designs, entitled "Beaconage and Buoyage of different Nations," which will be presented to the Congress by the said author.

(M.)—"*Uniform Quarantine Regulations.*"

If the motto of the old and renowned "Nautical Magazine," that "The seas but join the nations they divide," is a truth, the artificial barriers against the free intercourse which most Continental powers raise by their too severe and often vexatious Quarantine Regulations for the prevention of the introduction of contagious diseases, must be regarded as a curious contradiction and a serious mistake. Though this, also, generally has been freely admitted, the history of the International Quarantine Conferences held in Paris, 1851 and 1859, in Constantinople, 1866, and in Vienna, 1874, as well as the transactions of the Association for the Reform and Codification of the Law of Nations (see 7th Report, 1879), shows how extremely difficult it is to come to an understanding on this matter, as the very divergent views of various countries an regard to sanitary precautions have hitherto rendered it impossible to secure a general consent to principles which might form the basis of a Convention to regulate quarantine. Great Britain, however, continues to protest against the Continental systems, and to recommend her own hitherto successful system, according to the Order in Council of July 1873, and "The Public Health Act, 1875;" but we are not aware that any noticeable regard has been taken to this advice.

Therefore, we cannot come to any other conclusion than the said Commission would also in this question prove to be the best anchor-hold.

DIVISION 3.—"*Uniformity in different private judicial Mercantile Marine Matters.*"

Several mercantile marine questions of a more private judicial nature have often in the last fifteen years been discussed at the Conference of the different Associations mentioned before, and have thus given occasion for a number of able speeches and interesting reports enough to fill a whole library, but what in practice has been attained by these otherwise invaluable transactions is, indeed, very little. Though we agree in the opinion that most of these questions are well adapted to be considered as being of an international character, and, therefore, with benefit to the commercial world, should be treated with due regard to such character, we do not intend to reproduce such transactions, as this would exceed our resources, and besides, would not suit the limited plan for this Memorandum.

Nevertheless, for the sake of completeness, we beg leave to give the following short outline of the history of a few of the most debated of these matters.

(N.)—"*International Uniformity in the Law of Damages caused by Collisions at Sea.*"*

At the first Northern Maritime Conference (1883) this subject was discussed at great length, and the inconveniences of the present confusion, caused by the existing discrepancies, were amply shown, to the remedy of which several well-considered proposals were approved, but as the same matter also has been treated in the very best manner at the Antwerp Congress of 1885 (see the Report, pp. 130-146, and 296-318), we prefer to quote the Resolutions there adopted, viz. :—

"L'abordage dans les ports, fleuves, et autres eaux intérieures, est réglé par la loi du lieu où il se produit.

"L'abordage en mer, entre deux navires de même nationalité, est réglé par la loi nationale.

"Si les navires sont de nationalité différente, chacun est obligé dans la limite de la loi de son pavillon et ne peut recevoir plus que cette loi lui attribue."

"Si l'abordage a eu lieu dans les ports, fleuves, et autres eaux intérieures, on applique, quant aux fins de non-recevoir et aux prescriptions, la loi du lieu où il s'est produit.

"Si l'abordage a eu lieu en mer, le capitaine conserve ses droits en réclamant dans les formes et délais prescrits par la loi de son pavillon, par celle du navire abordeur, ou par celle du premier port de relâche.

"En cas d'abordage de navires, s'il y a faute commise à bord des deux navires, il est fait masse des dommages, lesquels sont supportés par les deux navires dans la proportion de la gravité qu'ont eue les fautes respectivement constatées comme cause de l'événement."

"Si l'abordage a été causé par une faute commise à bord d'un seul navire, le dommage est supporté entièrement par lui.

"Si l'abordage est fortuit ou douteux, chaque navire supporte son dommage sans répétition."

In want of a leader with authority, which the proposed Commission expectingly would yield, this important question has, however, as yet not advanced a whit.

(O.)—"*Uniform Salvage Regulations.*"

At the Antwerp Congress of 1885 (see the Report, pp. 146-151 and 304-314) the following Resolutions were adopted on this subject :—

"L'assistance maritime dans les ports, fleuves, et autres eaux intérieures est rémunérée d'après la loi du pays où elle se produit.

"L'assistance en mer est rémunérée d'après la loi de l'assistant.

"L'indemnité d'assistance ou de sauvetage doit être déterminée surtout en prenant pour la base les circonstances suivantes : le zèle déployé, le temps employé, les services rendus au navire, aux personnes, et aux choses, les dépenses faites, le nombre des personnes qui sont intervenues activement, le danger auquel ces personnes ont été exposées, le danger qui menaçait le navire, les personnes, ou les choses sauvées, enfin, la valeur dernière des objets sauvés, déduction faite des frais.

"Les passagers dont la vie a été sauvée ne doivent pas contribuer à la rémunération spéciale d'assistance.

"Tout contrat fait durant le danger est sujet à rescision."

"N'a aucun droit à l'indemnité de sauvetage ou d'assistance celui qui a imposé ses services, qui, notamment, est monté sur le navire sans l'autorisation du capitaine présent.

"Le capitaine qui rencontre un navire, même étranger ou ennemi, en danger de se perdre, doit, s'il le peut, venir à son aide et lui prêter toute assistance, sous des pénalités à comminer par la loi."

One of the English Delegates, Sir John Gorst, Q.C., M.P., the present Parliamentary Under-Secretary of State for India, recommended particularly the second Resolution for adoption, with the following noteworthy words :—

"Je n'hésite pas à me prononcer en faveur de la loi de l'assistant. Il faut encourager l'assistance, réagir contre l'égoïsme, si disposé à ne pas se déranger pour prêter secours à autrui. Il faut, au moins, que celui qui se dévoue ne soit pas privé, par une législation étrangère parcimonieuse, de la juste rémunération de ses peines. Vous encouragerez l'assistance et vous sauverez beaucoup de vies humaines en admettant que, en cas de conflit des lois, c'est celle de l'assistant qui prévaut."

As another English Delegate, Sir Travers Twiss, Q.C., heartily seconded this, with acclamation-accompanied expression, it is to be hoped that the British Government will take an interest in the furtherance of this truly international question.

(P.)—"*International Uniformity in the Law of General Average.*"

After many years of indefatigable labour, the before-mentioned Association, at a meeting at Antwerp in 1877, succeeded in getting adopted the so-called "York and Antwerp Rules" to form the basis for a uniform treatment of general average cases, and continual efforts have ardently been made to gain common adhesion to these Rules, so that at present in charter-parties and bills of lading of numerous

* The "Nautical Magazine" for 1881 contains a series of articles on this subject by F. W. Raikes, Esq., M.A., LL.M., Barrister-at-law. In these interesting and complete articles is represented the historical development of the Laws regulating this matter, with an extract of the Laws in force in this respect in the most important maritime countries; and, finally, suggestions for a General Code of Maritime Law on this subject.

ships a clause is inserted that they are to be applicated, and most Assurance Companies have submitted to them. But it is a natural consequence of the manner in which the "York and Antwerp Rules" were created, that, though they are both practical and suggestive, they are not complete; they comprise only the most frequently occurring and most debated points, but do not give any information as to numerous general average questions, and even within this limited ground there is room for deviating interpretations, so that they in nowise compensate the want of a uniform law of general average, though their adoption and application in the practical life must be admitted to be a promising step in the right direction.

Of course, this important question continues to be discussed at the meetings of the said Association (see, for instance, its Report for 1885), and was also treated at the Antwerp Congress of 1885; but it will carry us too far from our plan here to repeat these most interesting transactions.*

(Q.)—"*International Uniformity in the Law of Affreightment and Bills of Lading.*"

For a number of years there has also been worked assiduously by many Corporations and authors in maritime law to smooth down the existing discrepancies as to the Rules of Affreightment. At first the attention was directed particularly to some of the most glaring differences in the Maritime Laws of the respective countries, as, for instance, to distance freight; but, in the course of time, it seems that practical men have arrived at the conviction that it is more important to come to an agreement as to the limits the Laws ought to fix for the private contract liberty in this matter. The charter-party being a contract between the ship-owner and the freighter, there is no reason why they should not have a great liberty to agree on the conditions for the use of the vessel; nevertheless, there are some reciprocal duties and rights which are deeply rooted in the nature of the relation between them, and are a necessary sequel of it, and which it should not be allowed any one of the interested parties one-sidedly to abolish by a clause in the charter-party or bill of lading.

In England, where the legislation puts a very great and extensive liability on the owners, these, in the course of time, have, by additions and additions to the said ships' papers, tried to put off every sort of liability. To prevent such abuse the aforesaid Association took the matter in hand, and tried to gather all the interests for a common, reasonable bill of lading, which could form the basis of a further development of the question as to a universal Law of Affreightment. At the meeting in Liverpool (1882) a draft was agreed on, but as it was considered as being too moderate as to the liabilities of the ship-owners, and, besides, from a theoretical point of view, was found to be contending against the scientific principles of law, this question was again put under debate in Hamburg (1885), where a new draft was agreed on. Now it was the ship-owners' turn to be dissatisfied; none of them would introduce this normal bill of lading, and for the third time it must be rearranged in London (1887) where the following Resolution was carried:—

"That the following principle, adopted by the Conference of this Association, held in Liverpool in 1882, be now confirmed and adopted as the basis of discussion. That the principle of the common form of bill should be this: that the ship-owner, whether by steam- or sailing-ship, should be liable for the faults of his servants in all matters relating to the ordinary course of the voyage, such as the stowage and right delivery of the cargo and other matters of this kind; but, on the other hand, the ship-owner should be exempt from liability for everything which comes under the head of accidents of navigation, even though the loss from these may be indirectly attributable to some fault or neglect of the crew."

By this Resolution a result has been arrived at which, on the whole, agrees with that which, in the meantime, had been attained by similar transactions in the United States of America, and which, in our opinion, is as good as it is possible to attain by private exertion, as the ship-owners retain liability for everything respecting the equipment and seaworthiness of the ship, the stowing, preservation, and proper delivery of the cargo, but are exempted from all consequences of accidents occurring during the voyage, whether they are a consequence of *vis major* or of the faults or errors of the master or the crew. Much contest might be avoided by a universal adoption of this bill of lading. But there is still much left to be done. There is doubt and disagreement amongst the lawyers as to what may be acceptable or not for stipulation in the bills of lading. In fact, it is not known if this bill, which now tries to work its way for acknowledgment in the business world in the different countries, will be taken for good by this or that Court of Justice, and, therefore, there still exists an insecurity which ought not to be found in a matter so important for the general intercourse, but which first can be done away with when the international legislation steps in.

Finally, it may, perhaps, be expedient here to mention that a Scandinavian Merchant Shipping Commission, in 1887, has submitted to the respective Governments a scheme to fuse their Sea Laws, by which the three distinct Codes, each very ancient and original, will bring up for future use a fresh Code, made up of the best parts of each.

DIVISION IV.—"*The proposed International Permanent Merchant Shipping Commission.*"

In addition to our general remarks in Part I as to the usefulness, &c., of the said Commision, we beg leave here to give a few suggestions as to its eventual composition, mode of action, and expenses.

* In a work entitled "The Law of General Average, English and Foreign" (fourth edition, London, 1888), by Richard Lowndes, Esq., Average Adjuster, all the subjects in this matter are treated in an exhaustive and interesting way, and, therefore, will be found useful as a trustworthy and able guide on all matters relating to the law of general average and its adjustment. In the Appendices are quoted the Laws that have been or still are in operation throughout the maritime world.

In the like manner, as provided for by the latest International Conventions (see the Post Convention, dated Paris, 1st June, 1878, Article 16, and the Revised Telegraph Convention, dated Berlin, 17th September, 1885, Article 14), a Permanent International Merchant Shipping Bureau should be established in London, with a staff consisting of a Chief Secretary, two Assistant Secretaries, and the necessary number of clerks, &c. This Bureau—which should be the intermediate link between the Governments as to the regular and general communications respecting the international sides of merchant shipping questions—would, under the control of the Commission, have to collect and arrange all sorts of informations in respect to International Maritime Laws or Regulations, to prepare the proposals received from the Contracting Governments, Maritime Institutions, or private persons, to be laid before the Delegates of the Commission, and, on the whole, to perform the different inquiries or other special tasks intrusted to it by the Commission. It should take charge of all the necessary publications, the Reports of the Conferences held by the Commission, and the correspondence (in the English language) with the Commission or its Sub-Committees, as well as with the different Maritime Institutions and the public in general.

The Chief Secretary should attend the Conferences of the Commission and take part in the discussion, but without right of voting.

The Bureau to prepare a yearly Report (in the English language) of its works, and to forward it to the Administrations of the Contracting States.

The common yearly expenses of this Bureau might probably be estimated at the same sum as proposed for the expenses of the Bureau of the International Customs Tariff Commission at Brussels. The sum to be participated by the Contracting States in proportion to the gross registered tonnage of their merchant steam-fleets, but otherwise in the manner settled by the other International Conventions.

The Permanent Merchant Shipping Commission to be composed of two or three Delegates from each of the Contracting States, of which one should be an expert in practical maritime questions, and the other an expert in maritime law. The Commission to hold conferences with intervals of at least two years, alternately in the capitals of the six most important Maritime States. The expenses of these conferences to be borne in equal proportions by the Contracting States.

For the sake of convenience we shall finally recapitulate the questions mentioned under the foregoing divisions as eventually belonging to the domain of the said Commission:—

(A.) International Regulations for preventing collisions at sea.
(B.) International Code Book of Signals.
(C.) International tonnage measurement.
(D.) 1. Reciprocal arrangements as to the disposal of the estates of deceased seamen.
2. Agreements as to reciprocal surrender of deserted seamen from merchant-vessels.
3. Reciprocal arrangements as to the relief of distressed seamen in certain cases.
4. Reciprocal agreements as to the prevention of "unauthorized boarding of ships."
5. (*a.*) The International Convention relative to the police of the fisheries of the North Sea.
(*b.*) The International Convention respecting the liquor traffic in the North Sea.

(E.) Official wreck inquiries.
(F.) Official survey as to the seaworthiness of merchant-vessels.
(G.) Agreements for preventing the transfer of unseaworthy vessels to the flags of other nations.
(H.) Uniform marking and lettering of names of ships, port of registry, register tonnage, and draught scale of feet.
(J.) Uniform conditions as to the right to carry the national flag.
(K.) Uniform conditions respecting the qualifications for the acquirement of master's, mate's, and engineer's certificates of competency.
(L.) General uniform system of buoyage.
(M.) Uniform Quarantine Regulations.

(N.) International uniformity in the law of damages caused by collisions at sea.
(O.) Uniform Salvage Regulations.
(P.) International uniformity in the Law of General Average.
(Q.) International uniformity in the Law of Affreightment and bill of lading.

Final Remarks.

As this Memorandum has only been based on informations which every one could have acquired by studying the official or other publications having appeared the last twenty years respecting maritime matters or problems, and as we are not in connection with any Government Department in possession of the necessary intimate knowledge to international communications of similar kind, it may be that negotiations have taken place between the different Governments about questions as to other merchant shipping matters of an international character; nevertheless, we hope we have represented the most important of them, and in every case enough to prove to the maritime public that there is still a rich field to be found for the improvement of the existing Agreements, and for the adoption of new ones.

Having witnessed the establishment of the Conventions mentioned in the introduction, which, in our opinion, are far less important in respect to the security of life and property, we have no doubt that this plan in times to come will be a reality.

We hope, also, that we have stated enough to show that the sea traffic now-a-days has a well-founded claim; that the further development of its many-sided relations ought not any longer to be

left to the initiative and labours of private persons, howsoever earnest and energetic they may be, and how great appreciations they deserve; that it will not suffice that the important questions, which will never find their final solution, but—even when solved for a time—will claim attention again before long, on account of the never-ending development of the shipping trade, and which, at all times, are of so great consequence for the international intercourse, separately and at long intervals are made the object for diplomatic correspondence between the Governments; but that the traffic requires a permanent central organ, which can collect the endeavours and lead them in a rational direction, having the duty and right to speak, and being able to give its expressions the necessary weight, where it is expedient to break the resistance which old customs or abuse may put up against every progress.

Even if this plan should meet with difficulties, it is not the quantity of these which is decisive, where there is a question of reform, but it is the worth and importance of the reform itself. Every reform will have difficulties to overcome, but if it is a good one, at last it will make its way, and this will also be the case here; but every one who has the welfare of the sailor and the behoof of the sea traffic at heart, ought to contribute his part, that too long a time is not lost before it happens. And it ought not to be forgotten that the realization of this plan aims at something more than the satisfaction of the behoof of the material interests; for it is through progress of this kind that the way shall be paved for a better mutual understanding between the nations, for better relations between them, and for a better comprehension of the truth that all the peoples of the earth, in spite of their national peculiarities, have got by Providence a common work to do and a common aim to strive for—the development of the whole mankind to a life in peace and harmony.

Therefore, we finish by expressing a hope that the honoured Congress will yield its valuable assistance to the furtherance of the objects aimed at by this Memorandum.

Copenhagen, September 1888.

(Signed) C. F. TIETGEN, *Chairman of the Copenhagen Chamber of Commerce.*
N. JACOBSEN, *Manager of the Copenhagen Marine Insurance Association.*
N. J. JESPERSEN, *Inspector of the Bureau Veritas.*
AUG. SCHNEIDER, *Chief Registrar of Shipping.*

Appendix (B).

Report of Committee upon Division XIII.

Réforme de la Loi Internationale du 4 Novembre, 1879, sur les Collisions en Mer et création de Tribunaux Maritimes Internationaux.

Pétition au Parlement Français et Lettre aux Présidents des Chambres de Commerce Françaises et Étrangères, par Albert Riondel, Capitaine de Frégate en Retraite, Officier de la Légion d'Honneur.

Préface.

DEPUIS plus de deux ans nous nous occupons exclusivement des questions de collisions en mer et droit maritime.

L'approbation presque unanime que nos propositions ont rencontrée, auprès de deux Gouvernements étrangers, de quatre grandes Chambres de Commerce et de deux Congrès Internationaux, nous décide à faire un nouveau pas en avant.

Nous publions dans ce Mémoire les divers documents officiels que nous avons reçus. Nous les faisons préceder d'une Pétition à la Chambre des Députés et au Sénat. Nous demandons respectueusement au Parlement de prendre l'initiative de la réforme. Elle consiste en deux points principaux:—

1. La création de Tribunaux Internationaux pour juger les litiges maritimes entre navires de nationalités différentes;

2. La modification urgente de la Loi Internationale du 4 Novembre, 1879.

Nous nous adressons aux Présidents des Chambres de Commerce des capitales des seize Puissances ayant adhéré à a Loi citée plus haut, ainsi qu'aux Présidents des autres Chambres de Commerce de France.

Nous leur demandons également de vouloir bien approuver les propositions de la Chambre de Commerce de Paris et de voter, en outre, une clause additionnelle; celle-ci serait, à notre avis, un remède efficace et le moyen certain (comme le demande cette Chambre) "de résoudre ces questions internationales de si haut intérêt, et de satisfaire aux besoins de la grande famille du monde commercial."

L'Avant-Propos, qui précède immédiatement les documents officiels, expose les diverses phases de la question.

Nous limitons à ce cadre restreint la publication que nous faisons aujourd'hui.

Nous réunirons plus tard, dans un nouveau Mémoire, toutes les études que nous avons insérées dans la presse depuis "la collision du 'Saint-Germain' et du 'Woodburn.'"

(Signé) ALBERT RIONDEL.

Pétition à la Chambre des Députés et au Sénat.

J'ai l'honneur de placer sous les yeux de la Chambre des Députés et du Sénat les documents suivants ; ils touchent à la création de Tribunaux Internationaux Maritimes et à la réforme de la Loi Internationale des Abordages du 4 Novembre, 1879.

Je demande respectueusement au Parlement Français :—

De vouloir bien approuver les propositions de la Chambre de Commerce de Paris, dans sa séance du 13 Juillet, 1885 ; cette Chambre a transmis, ce jour-là, au Ministre du Commerce " un Avis tendant à ce que le Gouvernement Français s'entende avec les Gouvernements étrangers pour résoudre ces questions internationales de si haut intérêt."

Le Président de la dite Chambre m'écrivait le 9 Novembre, 1885 : " La Chambre ayant statué dans un sens conforme à vos propositions ne peut que vous donner connaissance de ses Résolutions."

Ces dernières sont au nombre de trois :—

1. La première est relative à la manœuvre qui est imposée (en cas de collision) au navire isolé rencontrant à la mer un groupe de bâtiments réunis ensemble par des remorques. Le navire isolé est libre de ses mouvements ; il devra désormais se déranger de sa route et céder le pas au groupe qui continuera la sienne.

2. Les deux autres Résolutions sont résumées dans le passage suivant : " La Chambre de Commerce estime en conséquence que non seulement la création de Tribunaux Internationaux s'impose pour les besoins de la grande famille du monde commercial, mais qu'il conviendrait surtout que toutes les nations eussent un même Code Maritime."

Les documents du deuxième dossier annexé montreront aux Représentants de la nation que les Résolutions de la Chambre de Commerce de Paris (saisie de mes propositions le 1er Mai, 1885) avaient été également approuvées, presque sans réserve, par le Gouvernement d'Athènes ; les trois grandes Chambres de Commerce de France : Marseille, Bordeaux, et le Havre ; et Le Gouvernement des États-Unis.

Il s'agit de la protection de la vie sur mer ; il faut diminuer, dans une large mesure et dans le plus bref délai, le nombre toujours croissant des désastres maritimes que déciment et jettent dans le deuil et la misère tant de familles de toutes les nations.

Je demande respectueusement au Parlement et au Gouvernement Français de prendre la cause en mains et de se mettre à la tête de la réforme.

(Signe) Commandant ALBERT RIONDEL.

Cherbourg, le 15 *Décembre*, 1885.

Lettre adressée par M. le Commandant Albert Riondel, aux Présidents des Chambres de Commerce Étrangères et Françaises.

M. le Président, 18, *Quai Caligny, à Cherbourg.*

J'AI l'honneur de vous adresser respectueusement les documents suivants ; je vous prie de vouloir bien les soumettre à l'appréciation de la Chambre de Commerce. J'espère, en raison de l'intérêt même de la question, que la Chambre voudra bien examiner avec bienveillance les propositions que je prends la liberté de soumettre à sa haute attention.

Les deux Gouvernements des États-Unis et de Grèce* m'ont donné leur approbation complète. Les quatre Chambres de Commerce Françaises de Paris, Bordeaux, Le Havre, et Marseille ont été également du même avis.

Les lettres qui m'ont été écrites par le Secrétaire-Général du Congrès d'Hambourg et par M. le Baron de Lambermont, Ministre d'État de Sa Majesté le Roi des Belges et Président du Congrès d'Anvers† témoignent aussi de l'intérêt des deux Conférences Internationales au sujet de mes propositions.

La Chambre de Commerce de Paris demande à tous les Gouvernements de s'entendre " pour résoudre ces questions internationales de si haut intérêt." Elle trouve " que non seulement la création des Tribunaux Internationaux s'impose pour les besoins de la grande famille du monde commercial, mais qu'il conviendrait surtout que toutes les nations eussent un même Code Maritime."

Ce langage trouvera son écho dans toutes les Chambres de Commerce ; il se répercutera partout et accomplira la réforme. C'est un devoir d'arrêter le flot de ces hécatombes maritimes incessantes, qui frappent si cruellement les familles des différentes nations. " A un titre quelconque, soit par profession, soit pour leurs affaires ou leurs plaisirs," elles ont plusieurs de leurs membres qui voyagent sur le terrible élément, sous les diverses latitudes ; on leur doit des garanties et la sécurité.

Dans ma troisième note au Congrès d'Anvers, j'ai demandé, à titre permanent, la réunion d'une Commission Internationale composée de seize membres, appartenant aux seize Puissances ayant adhéré à la Loi Internationale du 4 Novembre, 1879.

Cette Commission aurait pleins pouvoirs, nommerait elle-même son Président, se réunirait au point qu'il indiquerait et quand il le jugerait utile. N'étant pas trop nombreuse, composée d'hommes compétents, elle ferait de bonne besogne et l'harmonie régnerait dans son sein.

Cette Commisssion ferait le projet de la Loi Internationale uniforme, si justement réclamé par la Chambre de Commerce de Paris. Elle s'occuperait enfin de toutes les questions relatives aux moyens de prévenir les collisions en mer.

Cette Commission Internationale, une fois nommée, ne serait jamais dissoute.

* Le Gouvernement Russe (d'après une correspondance de Saint-Pétersbourg du 28 Novembre, publiée par le "Soleil") vient également d'approuver mes propositions (*voir* au second dossier).

† Les comptes-rendus ne sont pas encore publiés.

Le 17 Mars, 1884, dans ma brochure du "Saint-Germain" et du "Woodburn," j'exprimais cette idée dans les termes suivantes :—

"La Loi Internationale du 4 Novembre, 1879, a été faite pour prévenir les abordages à la mer. Elle doit toujours rester ouverte au progrès. Chaque événement malheureux devrait être étudié avec soin et servir d'enseignement pour l'avenir. Il est nécessaire que l'expérience si chèrement acquise ne soit pas perdue."

Si vous partagez cette manière de voir, je solliciterai de votre haute bienveillance la faveur de proposer à la Chambre de Commerce l'adoption de la clause suivante :—

"La Chambre de Commerce de adopte complètement les propositions de la Chambre de Commerce de Paris ; elle demande la nomination immédiate d'une Commission Internationale composée de seize membres, appartenant aux seize Puissances adhérentes à la Loi du 4 Novembre, 1879.

"Cette Commission devra être permanente ; elle nommera son Président, qui aura pleins pouvoirs de la convoquer et de la réunir là où il le jugera utile ; elle préparera (comme le dit la Chambre de Paris) 'la solution de toutes ces questions internationales d'un si haut intérêt ;' elle étudiera avec soin les collisions nouvelles où elle trouvera 'un enseignement salutaire pour les prévenir à l'avenir.'"

Recevez, &c.

(Signé) ALBERT RIONDEL.

Avant-Propos.

Dans la nuit du 25 au 26 Août, 1883, vers 2 heures un quart du matin, le paquebot Français "Saint-Germain" rencontre un groupe de deux navires Anglais, à 30 milles dans le sud de Plymouth, le vapeur "Recovery" remorquant le "Woodburn."

La collision eut lieu : le "Woodburn" sombra et dix-huit hommes de son équipage disparurent après l'abordage.

Des circonstances particulières nous ont fait étudier cette affaire ; d'abord, dans la presse locale de Cherbourg ; plus tard, dans une brochure publiée à Paris, 19, Quai Saint-Michel, chez Léon Vanier, Éditeur ; elle porte le titre de : "Collision du 'Saint-Germain' et du 'Woodburn' et ses Conséquences ;" par Albert du Hailly.

La brochure a été inscrite, depuis, sous notre véritable nom, par ordre du Ministre de la Marine, sur les exemplaires qui ont été déposés dans les bibliothèques de ce Département.

La Compagnie Transatlantique eut connaissance des articles du "Phare de la Manche," qui avaient été reproduits par les journaux du Havre ; elle nous fit remercier par son capitaine du "Saint-Germain."

La brochure avait paru au mois d'Avril 1884. Au mois de Décembre, nous l'adressâmes par l'intermédiaire des Ambassadeurs à Paris, aux seize Puissances Maritimes adhérentes à la Loi Internationale du 4 Novembre, 1879 ; douze de ces Ministres voulurent bien nous répondre et envoyer notre livre à leurs Gouvernements.

Quelques mois après, les Ambassadeurs d'Italie et d'Espagne, ainsi que les Ministres des États-Unis et des Pays-Bas nous firent parvenir les remerciements de leurs Gouvernements.

Ces différentes pièces constituent le premier dossier.

Jusqu'au 13 Avril, 1885, nous n'avions encore reçu que des témoignages d'estime ; ils n'avançaient pas cependant la question de la réforme internationale.

La date du 13 Avril, 1885, a été le point de départ d'un progrès sérieux ; ce jour-là, Mr. Morton, Ministre des États-Unis, à Paris, a posé les bases de la réforme ; elle ne peut plus se faire attendre longtemps désormais.

Mr. Morton disait dans le second paragraphe de sa lettre : "Vous me demandiez de soumettre votre travail à l'appréciation de mon Gouvernement ; je l'ai fait et M. le Secrétaire d'État m'adresse aujourd'hui une copie de la correspondance échangée à ce sujet avec le Secrétaire du Trésor et le Commissaire de la Navigation. Vous verrez par cette correspondance, que je m'empresse de vous adresser, que votre proposition a été étudiée sérieusement et dans un esprit tout à fait sympathique."

Le Secrétaire d'État, de son côté, en transmettant le Rapport du Commissaire de la Navigation, se servait de ces termes : "Le Département donne pleinement son assentiment à ces idées."

Le Rapport du Commissaire de la Navigation est véritablement remarquable ; il démontre d'une manière irréfutable la nécessité urgente de constituer, à bref délai, des Tribunaux Internationaux pour juger les litiges maritimes entre nations différentes.

Le Gouvernement de Grèce faisait aussi étudier nos propositions ; il approuvait également la creation des Tribunaux Internationaux Maritimes et se déclarait "tout disposé à prendre part aux travaux de la Conférence, quand les Puissances décideraient d'en convoquer une."

Étant en possession de ces documents, la pensée nous vint de les communiqner aux trois Chambres de Commerce Maritimes du Havre, Marseille, et Bordeaux. Nous adressâmes un peu plus tard le même dossier à la Chambre de Commerce de la capitale.

Nous avons trouvé, dans ces quatres grandes assemblées commerciales, l'accueil le plus empressé et le plus courtois ; elles ont approuvé sans réserve toutes nos propositions.

La Chambre de Commerce de Paris s'est exprimée avec une grande énergie, dans sa délibération du 13 Juillet, 1885 ; on peut s'en faire une idée par le passage suivant de la lettre qui nous a été écrite le 9 Novembre, 1885, par son Président :—

"La Chambre de Commerce estime, en conséquence, que non seulement la création des Tribunaux Internationaux s'impose pour les besoins de la grande famille du monde commercial, mais qu'il conviendrait surtout que toutes les nations eussent un même Code Maritime."

La netteté et la précision de ce passage sont complétées par le dernier paragraphe de la lettre :—

"Par ces motifs, la Chambre de Commerce de Paris, à la date du 13 Juillet, 1885, a transmis à

M. le Ministre du Commerce un Avis tendant à ce que le Gouvernement Français s'entende avec les Gouvernements étrangers pour résoudre ces questions internationales de si haut intérêt.

"La Chambre ayant statué déjà dans un sens conforme à vos propositions ne peut que donner connaissance de ses résolutions."

Ce qui caractérise surtout cette décision, c'est la demande directe et officielle adressée au Gouvernement Français par la Chambre de Commerce de la capitale.

Le Gouvernement est prié de résoudre immédiatement "ces questions internationales de si haut intérêt."

Il s'agit de protéger la vie sur mer; le vœu du commerce de Paris sera exaucé, car il est partagé par l'opinion unanime des autorités citées plus haut.

En même temps que nous nous adressions aux Chambres de Commerce, nous consultions également les deux grandes Compagnies Maritimes des Messageries et Transatlantique; elles emploient un nombreux personnel de marins, et leurs bâtiments ont eu plusieurs fois des collisions; la dernière, avec son "Saint-Germain," venait d'avoir, dans le Jugement de Londres du 7 Décembre, 1883, des ennuis sérieux. Nous espérions donc qu'elles s'intéresseraient à la question.

La Compagnie des Messageries, dans sa lettre du 5 Mai, 1885, nous a répondu:—

"Nous n'avons dû que prendre connaissance avec intérêt du dossier que vous nous avez transmis; mais les questions qui s'y trouvent traitées dépassent évidemment la sphère de notre action; c'est seulement en s'adressant au Département de la Marine que M. Riondel peut, suivant nous, espérer arriver à une solution en ce qui touche les sujets spéciaux qui font l'objet de son travail."

La Compagnie Transatlantique n'a exprimé aucune opinion.

Toutes ces différentes pièces composent le second dossier.

Le Président de la Chambre de Commerce du Havre nous avait donné le conseil, dans sa lettre du 18 Juin, 1885, de nous mettre en relations avec deux Congrès Internationaux qui devaient se réunir: le premier, le 18 Août, à Hambourg, et le second à Anvers, le 27 Septembre, 1885. Nous avons suivi ce conseil; par l'intermédiaire des deux Consuls de France dans ces deux villes nous nous sommes mis en relations avec les Présidents des deux Conférences; nous avons trouvé chez eux l'accueil le plus encourageant.

Le Président du Congrès de Hambourg, M. le Dr. Sieveking, Président du Tribunal Civil Supérieur des Villes Hanséatiques, a mis une grande insistance pour nous engager à aller traiter en personne la question devant la Conférence; c'est ce qui nous a déterminé à faire le voyage de Paris et à adresser au Président du Conseil et aux deux Ministres des Affaires Étrangères et de la Marine, une demande qui n'a pas été accueillie.

Nous avons résumé, en quatre notes séparées, qui ont été envoyées au Président du Congrès d'Anuers, les diverses propositions qui résultaient, non seulement de l'étude de la collision du "Saint-Germain" et du "Woodburn," mais encore des divers travaux que nous avons faits plus tard, jusqu'à la fin de Septembre. Nous n'avions présenté qu'une seule note à la première Conférence de Hambourg.

Nous n'avions pas dû communiquer aux deux Congrès les Résolutions de la Chambre de Commerce de Paris; ces deux assemblées auraient, sans doute, pris des conclusions du même genre.

Comme nous l'avons dit plus haut, la Chambre de Paris avait statué le 13 Juillet; mais ce n'est que par la lettre de son Président (datée du 9 Novembre) que nous avons eu connaissance de ces Résolutions.

Les comptes-rendus des deux Congrès ne sont pas encore publiés; on ne connaît pas leurs Résolutions; toutefois, les deux lettres qui nous ont été écrites par le Secrétaire-Général de la Conférence de Hambourg, l'honorable M. Alexander, et par le Baron de Lambermont, Ministre d'État de Sa Majesté le Roi des Belges, sont un témoignage manifeste de l'intérêt que les deux grandes assemblées internationales ont bien voulu porter à la question; elles vont insérer les documents que nous avons soumis respectueusement à leur haute et bienveillante attention.

Ces pièces constituent le troisième dossier.

Une correspondance de Saint-Pétersbourg du 28 Novembre (journal le "Soleil") annonce que la première de nos propositions vient d'être adoptée par l'Assemblée Générale des Commandants d'Escadre, des Amiraux et Capitaines de Navires, qui s'est réunie dans ce but à Cronstadt.

Appendix (C).

Report of Committee upon Division XIII.

International Marine Conference.

Programme of Subjects.

(General Division XIII.)

"The establishment of a Permanent Maritime Commission."

(*a.*) The composition of the Commission.
(*b.*) Its power and authority.

AS a member of the Committee appointed to consider and report on the above-named Division, I beg to submit, for the consideration of this Committee, the following remarks:—

Section (b). The problem to determine the power and authority of any International Commission

has always been considered to be most difficult to solve, and this seems particularly to be the case when a Commission shall have to deal with maritime matters.

The second Northern Marine Conference held at Copenhagen July last year, which consisted of about 200 Delegates from the greater part of all existing maritime institutions in Norway, Sweden, Denmark, and Finland, and which represented a merchant fleet of a registered tonnage between 2,000,000 and 3,000,000 tons, ranging in order of all merchant fleets as the second or third, unanimously passed a Resolution by which the establishment of a Permanent International Marine Commission, with a Bureau, was recommended, and also that a Memorandum to this effect should be presented to the present International Marine Conference at Washington.

This Memorandum, which also has been distributed to the distinguished members of this Committee, will clearly show that it was not the intention of the Northern Conference that the proposed International Marine Commission, with permanent Bureau, should have any power or authority at all, and therefore in no way would interfere with the sovereignty of the different Contracting Powers. On the contrary, it should only form the connecting link between the different Maritime Governments and countries in all maritime matters of an international character. It should also be composed as much as possible in conformity with the Commissions or Conferences, and their permanent Bureaux, established under the Conventions about an international metre measure, about the international postage and the international telegraphy, which have acted with so much benefit to international intercourse.

As before said, the Northern Conference of 1888 proposed both a Permanent International Marine Commission, consisting of Delegates from all maritime nations, and a Permanent Marine Bureau.

Though in accordance with the principle of these proposals, I think it expedient at present, by the experience gained during the sittings of the present Conference, only to offer some suggestions as to the establishment of a Permanent International Marine Department or Bureau. The views entertained on the composition and mode of action of a Permanent International Maritime Commission seem at present to vary too much. For instance, in a Report presented to the present Conference by several French Marine Societies, dated Havre, 5th August, 1889, it is recommended (pp. 104-126) to establish a "Tribunal Suprême International établi en pays neutre, et composé de Magistrats Internationaux pour juger souverainement, en fait et en droit, les Jugements nationaux en dernier ressort qui lui seraient déférés."

As far as I know, the general opinion is that the time for such an institution has not come, and will not come for many years.

In the Report presented by the Branch Hydrographic Office, New York City, it is only said about the Permanent Commission mentioned in Division (B):—

"The establishment of such a Commission is to be generally desired, and much good can be done by providing for an annual meeting for the purpose of regulating maritime affairs.

"The composition of the Commission and its powers and authority should be settled by the Conference, and can become a part of the International Agreement."

Maybe the present International Conference will not be actually dissolved, but only adjourned, in order to assist in the further steps necessary for carrying into effect its proposals and recommendations, and so, for some time at least, could perform the part of an International Maritime Commission.

In consideration of these circumstances the following remarks only apply to the establishment of an International Maritime Department, or Bureau, which, of course, would have no other power or authority than that which would result from the knowledge that all international maritime matters taken up by such an institution would be treated with impartiality and by the best practical and scientific experts which can be procured in the whole world.

Section (*a*). As to the formation of the said institution, I particularly wish to draw the attention of the Committee to the Rules for the International Bureaux established according to the "Règlements annexés à la Convention Postale Internationale, Paris, 1er Juin, 1878, Article XVI, et à la Convention Télégraphique Internationale de Saint-Pétersbourg, révision de Berlin, le 17 Septembre, 1885; et à l'Union Internationale pour la Publication des Tarifs Douaniers; Bruxelles, 1888."

In accordance with the principles laid down in these Regulations, the International Department in question should be established in a great maritime city—presumably in London—and should, if no no International Marine Commission is established, be under the supervision of the Foreign Office in the country where it is domiciled. This Department would then be the intermediate link between the Governments as to the regular and general communications respecting the international sides of merchant shipping questions. Its principal data should be to collect and arrange all sorts of information in respect to International Maritime Laws or Regulations, to prepare the proposals received from the Contracting Governments, maritime institutions, or private persons, for the consideration of future International Marine Conferences, and on the whole to perform the different inquiries or other special tasks intrusted to it by the Contracting Powers. It should take charge of all the necessary publications and the correspondence with the different Governments, as well as with the different maritime institutions and the public in general.

The Department should also prepare a yearly Report of its labours, and forward it to the Maritime Departments in the Contracting States.

It should have a Staff consisting of a Chief Secretary, three or four Assistant Secretaries, and the necessary number of clerks, &c.

The Chief Secretary should attend the future Maritime Conferences, and take part in the discussion, but without the right of voting.

The common yearly expenses of this institution might probably be estimated at about 300,000 fr. yearly, which is 200,000 fr. higher than the yearly expenses for the International Postage Bureau at Berne, and 175,000 fr. higher than the expenses for the Bureau of the intended "International Customs

Tariff Commission" at Brussels; but having regard to the importance of the Maritime Department, its more costly residence, and the practical trials with light and fog apparatus, &c., which must be expected, it is not safe to estimate the yearly expenses at a lower sum. This sum might, perhaps, be defrayed by the Contracting Powers in proportion to the number of their merchant-ships above 100 tons gross tonnage, or in the manner settled by other International Conventions.

If it is asked who should appoint the officers belonging to such an institution, I should think that the simplest way would be to advertise over the whole world that an International Maritime Department is to be established with Secretaries and clerks, and then, if no International Maritime Commission is in existence, leave it to Delegates from the Contracting Powers, nominated expressly for that purpose, to make the selection among the applicants. The voting might perhaps be given according to the above-named proportion, and the said Delegates would no doubt be careful to select the officers from different countries in order to secure the greatest possible knowledge of the different languages.

As will be seen, there is nothing new or original in this plan, as it is only continuing in well-known and tried paths laid down by earlier International Conventions.

That such an institution would be a great benefit for all the countries which do not own such an excellent Department as the British Board of Trade is self-evident. Almost every maritime reform which is asked for in the different countries must be considered also from an international point of view, but at present it is often rather difficult to get the necessary information in this respect; while, if such a Department existed, in a short time, and in the most reliable manner, the necessary information would easily be obtained. This would no doubt assist the various Governments considerably in carrying through the proposed new Maritime Laws, as certainly the advices and recommendations from such an international institution would be listened to with respect, and, if otherwise acceptable, followed by the Legislative Assemblies. I should also think that if such a Department had existed before the present Conference took place much labour and time would have been spared. Many important questions raised, which are now dropped, in want of any institution to get them inquired into and tried, would also then get a proper treatment. For instance, in looking into the valuable Report of the Committee on Systems and Devices, I find the following remarks on several proposals on night-signalling, &c.:—

No. 5. "This signal-lantern appears a good lamp, and is well reported on by United States' naval officers."

No. 27. Light-house fog-horn. "Not within the scope of the Conference as regards light-houses, but is worth a trial on board ship."

No. 37. Lamp without a wick. "Committee cannot pronounce an opinion without comparing this lamp with others at sea."

"On Miscellaneous Subjects."

No. 23. "New system of lamps and electric buoy." "Committee cannot pronounce an opinion without seeing them at sea."

No. 25. White flash stern-light with model. "Worth the consideration of Conference if occulting stern-lights are introduced."

Here the question must strike everyone, "Who is to take care of these recommendations, and who is to make the necessary trials?

As a member of the Committee on Sound-Signals, I have also had the opportunity of looking into a great part of the seventy or eighty inventions or proposals as to fog-signals. Though some of these must be considered as valuable, and when times are ripe perhaps will be introduced in practice, I am afraid that no official notice will be taken of them, and that they therefore will be lost for the maritime world. On the contrary, if such an international institution existed, all such proposals and plans would be forwarded to it, registered there, compared with other proposals in the same direction, and, if possible, tried in practice. If the Department should be unable to do so with its own means, there would certainly be many maritime countries which willingly would, on an application to them from the Department, take the matter in hand and get the wished-for trials executed.

The Reports from the other Committees have not yet been laid before the Conference, and it is therefore not easy to know if the matters treated by them have been found to be of such a character that they ought to be arranged by International Agreements, or should be left only to be made by local Rules. If the questions are to be arranged according to International Agreements, I do not see how it at present can be done, whereas, if the said International Department existed, the valuable recommendations could be instantly acted on and carried into effect in a comparatively short time.

If it is asked what maritime matters, other than those contained in the programme, would by-and-bye come under the care of said Department, I should wish to draw the attention of the Committee to the fact that, in the opinion of the oft-mentioned Northern Conference, there are several other matters which are of such a character that they ought to be arranged according to International Agreements.

Of such matters there are named and shortly treated in the Memorandum presented to the present International Conference the following:—

1. International tonnage measurement.
2. Agreements for preventing the transfer of unseaworthy vessels to the flags of other nations.
3. Uniform Quarantine Regulations.
4. International uniformity in the Law of Damages caused by collision at sea.
5. Uniform Salvage Regulations.
6. International uniformity in the Law of General Average.
7. International uniformity in the Law of Affreightment and bills of lading.

I only mention these questions in order to show that there is a number of international maritime

questions which should be prepared by a Department of the said kind, to be laid before future International Maritime Conferences.

The maritime institutions in the north of Europe take the greatest interest in this question, and the standing Committees of the Northern Maritime Conferences have expressly wished that I should do my best to gain the good-will of the present International Conference for the plan herein mentioned. I therefore sincerely hope that this important Committee will see its way to meet the wishes of the Northern Conference by recommending the establishment of an international institution of the described kind.

Finally, I may add that the Scandinavian ship-owners have so keenly felt the want of a head-quarters that they, in this year, have established a common Central Maritime Bureau at Copenhagen, wholly at their own expense.

(Signed) AUG. SCHNEIDER. *Delegate from Denmark.*

Washington, November 25, 1889.

To the Committee appointed to consider and report on General Division XIII.

Appendix (D).

Report of Committee upon Division XIII.

Union Syndicale Mutualiste des Inscrits Maritimes du Havre et Syndicats de Navigateurs Français adhérents.

Rapport sur le Programme du l'Amiral Franklin, Président de la Conférence Maritime Internationale de Washington, par M. T. Augé, Capitaine au Long Cours, Président de l'Union Syndicale Mutualiste des Inscrits Maritimes du Havre, Membre de plusieurs Sociétés Savantes.

Conférence de Washington.—Programme Officiel de l'Amiral Franklin.

Rapport sur le Chapitre XIII.

Chapitre XIII.—*Commission Interpermanente, sa Composition, ses Pouvoirs, et les Tribunaux Internationaux.*

LA mer libre n'est la propriété de personne ; elle est d'un usage commun à tous les peuples navigateurs. Le développement de la navigation avec les engins modernes, les richesses immenses que l'on confie à la mer, les bienfaits économiques, qui en résultent pour tous les peuples de la terre, ont nécessairement de tous les temps appelé l'attention des Gouvernements civilisés sur l'usage que les navigateurs font et doivent faire de cette mer libre, qui n'est et ne saurait être, ni le patrimoine commun des peuples maritimes, ni le patrimoine particulier d'aucune nation.

Chaque nation, chaque peuple maritime, à le droit de faire dans la mer libre tout ce qui lui convient, à la condition cependant de ne pas nuire à la liberté d'autrui.

Et c'est de ce principe vrai que découle le droit incontestable pour les Gouvernements Maritimes de régler impersonnellement et dans un intérêt commun, l'usage de cette mer libre, usage, nous l avons dit, qui ne doit avoir pour bornes que la liberté des autres ; de là, la condition essentielle que tous les peuples qui naviguent soient soumis à cette loi commune qui règle l'exercice que l'on doit faire de cette propriété neutre, qui ne saurait avoir un maître et dont l'usage est imprescriptible.

La Conférence doit donc être composée des Représentants de tous les peuples maritimes, et ses pouvoirs peuvent alors s'exercer légitimement sur tous les actes de la navigation qui ont un caractère d'intérêt général commun à tous les navigateurs, pour l'usage qu'ils font de cette mer libre ; en un mot, pour protéger la liberté d'autrui, dans l'exercice de sa propre liberté.

Et c'est pour cela qu'il est nécessaire aujourd'hui, en présence des dangers que font courir les bateaux rapides aux autres navigateurs, que les nations civilisées se réunissent, pour poser les bases d'un Code International commun à tous les peuples maritimes ; et établissent des règles fixes pour les conflits internationaux qui peuvent surgir dans cette mer libre et pour éviter les catastrophes fréquentes qui font gémir l'humanité.

La Conférence de Washington d'après le programme n'a pas d'autre but.

Pour arriver à des résultats pratiques, nous pensons qu'après la vérification des pouvoirs des Délégués la Conférence devrait se diviser en cinq Commissions, et siéger en permanence jusqu'à ce qu'une solution définitive sorte de ses travaux :—

1. Une Commission révisant le Règlement International de 1884, composée de marins-manœuvriers ayant exercé de longs commandements à la mer, à la voile, et à la vapeur ;

2. Une Commission pour examiner les signaux visuels de jour et de nuit, phoniques, &c. ; composée de marins-timoniers, car il faut pour cela être spécialiste, avoir des connaissances particulières sur cette partie du programme ;

3. Une Commission de marins-ingénieurs, étudiant la navigabilité des navires, le tirant d'eau, les bouées et balises, enfin tout ce qui concerne le génie maritime ;

4. Une Commission de marins hydrographes, étudiant le tracé des routes d'aller et de retour sur les cartes à l'usage des rapides, pour les points les plus fréquentés par ces sortes de navires ;

5. Une Commission de marins-légistes, pour établir les règles qui doivent prévenir les conflits et régler tout ce qui concerne la procédure entre navires de nations différentes.

Les cinq spécialités ci-dessus indiquées se rencontreront certainement dans les Délégues des seize nations adhérentes, et à cette condition, l'œuvre de la Conférence sera féconde et pratique, nous ne saurions en douter, la nomination des Délégués des États-Unis et la spécialité connue des membres qui la composent, nous est un sûr garant du succès ; si les autres nations, comme il n'y a pas lieu d'en douter, s'inspirent des mêmes idées et des mêmes sentiments.

Nous allons dans ce dernier Rapport traiter les réformes et les créations qui nous semblent nécessaires, sans toucher au droit des gens, pour arriver à la solution pratique du problème qu'à notre avis devra résoudre la cinquième Commission de la Conférence.

Cette grave question de juridiction internationale est une des plus délicates qu'ait à traiter le Congrès, et cependant elle est des plus nécessaires et des plus urgentes à résoudre ; nous croyons que, sans froissement aucun, elle peut être résolue d'une manière équitable et pratique, sans empiéter sur les droits souverains de chacune des Puissances Contractantes.

Prétendre créer des Tribunaux Internationaux à un ou deux degrés, dans les grandes Métropoles Maritimes, ne nous paraît pas pratique.

Il suffirait, selon nous, d'un Tribunal Suprême International établi en pays neutre, et composé de Magistrats Internationaux pour juger souverainement, en fait et en droit, les Jugements nationaux en dernier ressort, qui lui seraient déférés. La procédure serait simple et peu coûteuse; elle aurait lieu sur requête, sans ingérence d'avocats ni d'avoués.

Les documents de la cause, les dits, les contredits, fournis par les parties, le Tribunal prononcerait souverainement dans un délai déterminé.

Ce Tribunal aurait dans sa compétence, au point de vue des réparations civiles, toutes les contestations résultant de délits et de quasi-délits, par suite de violation du Règlement International relatif aux collisions.

Pour les Tribunaux nationaux devant connaître de ces réparations civiles jusqu'en dernier ressort, une simple règle de procédure, qui se pratique même souvent dans les pays hors d'Europe par nécessité, devenue générale, suffirait à notre avis comme réforme des Tribunaux Nationaux, pour juger les questions d'abordages.

On a parlé de célérité dans les affaires de ce genre en matière de procédure maritime devant les Tribunaux de Commerce Français, et même ailleurs, devant l'Amirauté Anglaise, la procédure est ce qu'il y a de plus sommaire et de plus rapide.

En France un procès maritime n'est point long ; il a d'abord la priorité pour le rôle ; il ne faut que le temps moral et nécessaire pour l'instruction ; ce sont parfois le où les experts qui ne sont pas prêts pour leur Rapport, ou même le plus souvent les avocats des parties qui font remettre l'affaire.

N'importe quels Tribunaux que l'on créerait sous n'importe quelle dénomination, ces Tribunaux ne pourraient moralement être plus expéditifs que nos Tribunaux de Commerce, successeurs de nos anciennes Amirautés.

Ces Tribunaux ont-ils toujours, en fait, toute la compétence nécessaire pour prononcer sur des faits purement techniques ?

Parfois, selon la composition du Tribunal, et toujours par des experts techniques ayant beaucoup navigué.

Par là, on comprend le rôle considérable que jouent les experts dans les questions maritimes internationales soumises à l'appréciation des Tribunaux, questions spéciales s'il en fut, car, quiconque n'a pas navigué ne peut se rendre un compte bien exact des faits purement techniques qu'il peut être appelé à juger. Nous sommes sur ce point en désaccord avec les Arrêts de la Cour de Cassation du 2 Juillet, 1828, et 13 Décembre, 1842.*

Dans la vie ordinaire, bien que l'on n'exerce pas une profession, l'ensemble des connaissances générales que l'ont peut posséder permettent d'avoir un aperçu de cette profession. La vue, les relations, les entretiens avec des hommes compétents, la vérification d'un fait, toujours facile et possible par soi-même, peuvent permettre à tout homme éclairé d'avoir une idée de la chose qui est soumise à son appréciation ou à son jugement.

Ce serait une grande erreur de croire qu'il peut en être ainsi des faits techniques passés à la mer entre ciel et eau. L'équipage lui-même, rompu au metier, souvent ne peut se rendre compte, sur le coup, de la situation et des causes qui ont pu motiver une manœuvre de préférence à une autre qui semblait naturellement indiquée, et les Magistrats Consulaires ou autres qui ne sont pas de la partie, malgré leur plus grande science juridique, il faut bien le dire, sont certainement ignorants des causes qui ont déterminés les faits qu'ils sont appelés à juger, ne les connaissant que par le rapport des experts.

La pierre angulaire de toute procédure pour des faits maritimes se rattachant aux collisions réside dans l'intégrité et la capacité des experts et dans la fidélité littérale de la traduction des documents servant de base légale au procès. Le rapport des experts en ces matières est généralement homologué ; c'est donc ces derniers qui en fait sont les véritables juges, les Magistrats prenant leurs décisions sur leurs dires, et n'étant, en un mot, que l'écho de leurs conclusions.

En vain, nous dirait-on, que le droit peut parfois être appliqué différemment à des faits déterminés ; ceci est possible, mais pas en matière d'abordage ; si le contraire a eu lieu, c'est que les

* Ces Arrêts disent : "Les Juges sont aussi souverains appréciateurs de l'abordage ; ils peuvent se dispenser d'avoir recours à une expertise s'ils trouvent dans la cause des éléments suffisants de décision." Nous sommes contraire à cette doctrine, estimant que la justice ne saurait jamais être trop éclairée.

documents relatant les faits n'étaient pas les mêmes, et s'ils étaient les mêmes, ils n'étaient pas traduits par la même personne.

Voici, à notre avis, ce qu'il serait important de faire pour que le Tribunal ayant à se prononcer sur un fait international d'abordage donnât une entière garantie d'impartialité aux parties sans toucher à l'organisation judiciaire.

Il faudrait que dans toutes les affaires de ce genre le Rapport de l'affaire fut fait par trois experts et jamais par un seul, avec mission d'arbitre ; procédure néfaste qui donne à un homme, sans responsabilité, le droit que la loi dénie à un seul Magistrat.

Si les parties veulent régler amiablement leur litige, rien de mieux, mais alors qu'elles nomment leurs arbitres en dehors du Tribunal. Les trois experts seraient nommés, un par le Tribunal et les autres par chacune des parties.

Le défendeur ou l'ajourné assisterait ainsi, par représentation, à l'instruction de l'affaire ; il serait certain de l'exactitude des documents traduits versés aux procès, ainsi que du sens technique des dépositions de l'équipage de l'un ou de l'autre navire.

Les experts pourraient être de n'importe quelle nationalité, à l'exception de celui nommé par le Tribunal bien entendu que les autres devraient parler la langue dans laquelle le Rapport sera fait ; c'est là l'innovation.

En vain objecterait-on que cela ne modifierait pas le Code différent, suivant le pays où le litige serait jugé.

Nous répondrons que cette différence de Code en matière d'abordage n'a au fond qu'une faible importance, si toutefois elle en a ; que s'il est différent quant aux règles de procédure, il ne l'est radicalement jamais un fond ; que toutes les nations policées ont dans leurs lois ce principe d'équité et de justice : que quiconque par sa faute porte préjudice à autrui est tenu de le réparer. Or, le principal est l'appréciation de la faute, c'est-à-dire, de connaître laquelle des deux parties a violé le Règlement International ; le Code particulier de chaque pays, si différent qu'il soit, n'a rien à voir à cette constatation du fait, qui est universelle.

Il en est de même pour l'évaluation des dommages. Un cas seulement peut offrir certaines divergences pour l'application de la pénalité ; c'est quand il y a faute commune ; le mot douteux étant impropre dans ce cas, la répartition des dommages entre les parties n'est pas la même dans les différents Codes. Nous estimons, nous, qu'il est facile d'y remédier ; la faute commune ne pouvant être assimilée aux cas fortuits, il y aurait à prendre un terme moyen, faire masse des dommages, et diviser par moitié, comme l'indique l'Article 407 du Code Français, en changeant cependant, pour plus de clarté, les mots : " s'il y a doute dans les causes," par ceux-ci : " s'il y a faute commune, quant il y aurait doutes dans les causes, il y aurait cas fortuit."

Il est en France une institution vermoulue qui est en contradiction formelle avec les principes qui régissent son Gouvernement, qui, lors de l'existence des droits prohibitifs de douane, pouvait, selon le dire de bien des gens, avoir sa raison d'être, bien que nous n'en pensions rien. Elle était, disent-ils, l'auxiliaire du fisc pour la surveillance, comme depuis longtemps notre régime douanier a été réformé, que des docks-entrepôts ont été créés dans tous les ports, où les matières soumises encore à de fortes taxes entrent ; par la création de ces docks-entrepôts on peut dire que la Douane à les navires et les marchandises dans sa main, et, par suite, un contrôle facile et constant des déclarations faites à l'entrée par le capitaine.

Cette institution caduque n'a aucune raison d'être ; ses services vis-à-vis de l'État sont nuls, et vis-à-vis du commerce maritime, pour ses rapports avec la Douane, inutiles et très onéreux.

La preuve de son inutilité c'est que nos plus grands armateurs se privent de ses services ; ils ne sont donc pas indispensables ; un simple commis fait sa besogne.

Et la preuve qu'ils sont très onéreux, c'est que bien des navires étrangers ne veulent plus venir dans certains ports pour ne pas être taxés et rançonnés pour des services que leurs capitaines ou le consignataire du navire peuvent faire.

Cette institution pèse d'un poids considérable sur les relations maritimes de certains ports avec l'étranger, et surtout dans les affaires litigieuses, bien que la compétence, en fait, des courtiers maritimes soit toujours contestable ; cette ingérence a une influence pernicieuse sur la procédure, les courtiers étant les traducteurs des documents ; les navires sont, en outre, frappés d'une taxe obligatoire par la force des choses, allant en moyenne à 1 fr. par tonneau de jauge, non pas au profit de la navigation, ni des œuvres du port, mais de huit ou neuf personnes, jouissant d'un monopole exclusif, alors que les pouvoirs publics se privent trop souvent de certaines améliorations d'intérêt général, pour ne pas frapper les navires de taxes nouvelles, dont ils sont déjà surchargées.

Ce monopole est aujourd'hui le plus grand obstacle au développement du commerce maritime avec l'étranger.

La France et le commerce maritime ont tout à gagner à la disparition de ce scandaleux monopole.

Il y a longtemps que pour l'intérêt économique du pays il ne devrait plus exister.

La France est la seule nation maritime qui ait conservé cette institution surannée. Singulière chose, l'on s'acharne à soutenir qu'elle est nécessaire pour l'intérêt des navires étrangers, quand ces mêmes navires déclarent et proclament qu'elle leur est inutile et agissent même auprès de leurs Gouvernements pour qu'ils négocient avec le Gouvernement Français l'abolition de ces charges onéreuses de courtiers maritimes. Les revendications fréquentes des courtiers devant les Tribunaux pour faire respecter leur monopole sont la preuve la plus éclatante de leur inutilité et de leur impopularité.

Ces officiers Ministériels, à l'abri de leur monopole, ont seuls le droit de traduire les documents de procédure ou autres devant les Tribunaux de Commerce, et c'est pour cette dernière fonction incompatible, moralement, avec la première, que la question des courtiers maritimes nous intéresse et que nous nous sommes occupés d'eux dans ce Rapport.

C'est comme truchements avec la Douane et comme interprètes jurés que nous demandons une

réforme radicale ; cette double fonction pèse sur leurs traductions, ces dernières, pour ce qui est des faits, peuvent paraître parfois nébuleuses et équivoques ; et pourraient ainsi changer par leurs indécisions même la face d'un procès si les experts chargés de l'examen des faits ne connaissaient pas la langue dans laquelle le Rapport des capitaines est écrit. Mieux vaudrait une traduction littérale que la loi et la morale exigent qu'une traduction qui, quelquefois pourrait avoir la prétention d'expliquer le fond d'une cause qui, par sa nature, ne peut être sérieusement connue du traducteur.

Et, par une anomalie incompréhensible, c'est toujours le courtier truchement du navire qui traduit les documents du capitaine demandeur ou défendeur dont il est mandataire, et c'est cette traduction des documents du litige faite par ce mandataire qui sert et servira de base à toute procédure ; le courtier est souvent, à l'insu des Magistrats et des experts, juge en sa propre cause. Qu'on examine de près cette question, qui n'a rien de comparable dans aucune législation, et l'on verra le bien-fondé de nos observations ; c'est une énormité scandaleuse qu'on est étonné de voir subsister encore, car les fonctions d'interprètes jurés, cumulées avec celles de *negotiorum gestor*, sont immorales.

Nous estimons, dans un intérêt de justice, que les interprètes jurés près les Tribunaux compétents pour juger les contestations internationales maritimes dans tous les pays, doivent être des officiers relevant du Tribunal, et ces fonctions incompatibles avec celles de mandataire officiel ou officieux du capitaine ou de l'armateur qui est en cause.

C'est en général de la traduction du Rapport et de l'interrogatoire de l'équipage que l'on connaît les circonstances de la cause, expliquant les événements ; c'est de la traduction littérale du Rapport du capitaine, narration fidèle des faits, que les experts déduiront leurs conclusions.

Comment admettre que ce soit l'homme du demandeur ou du défendeur qui traduise ces faits, énoncés à un moment où le capitaine ne pouvait prévoir la procédure, temoignage précieux de l'exactitude des faits, et auquel la loi attache une importance capitale.

Malgré toute la délicatesse de son caractère et des fonctions qu'il remplit, un doute doit nécessairement planer sur la traduction d'un courtier maritime qui, dans l'intérêt de son client, dirige la procédure ; difficilement un avocat montrerait au Tribunal une pièce, un document qui pourrait être préjudiciable à son client ; il ne montrerait que ceux qui pourraient être utiles à sa thèse ; il n'est pas malhonnête pour cela ; il défend l'intérêt de son client qui le paye ; le courtier maritime fait de même.

Nous pensons donc qu'il est de la plus grande urgence que le monopole des courtiers maritimes en France soit aboli, et que dans tous les pays maritimes les interprètes près les Tribunaux qui jugent les matières maritimes internationales soient des fonctionnaires attachés au Tribunal, n'ayant aucun intérêt ni moral, ni matériel dans les litiges, n'ayant aucun rapport avec la profession d'agent maritime.

De cette manière, à notre avis, les documents remis aux experts seraient la représentation exacte, littérale, des faits arrivés, traduction faite par des hommes complètement désintéressés à la solution positive ou négative du litige, traduction faite sans aucun artifice. Combien d'abus ce sont produits à l'insu de bien des gens, des traducteurs mêmes, dominés qu'ils étaient par les fonctions de mandataire d'une des parties ; ce dédoublement de la même personne dans les fonctions aussi délicates et aussi opposées ne peut être décemment maintenu ; il est immoral ; la Conférence a le droit d'en demander la suppression.

Voilà, selon nous, dans l'organisation de la procédure des Tribunaux Nationaux jugeant des questions internationales en matière d'abordage, les réformes à faire pour avoir une justice prompte, peu coûteuse, équitable, sincère et juste, donnant satisfaction aux droits des parties à quelque nation qu'elles appartiennent.

1. Nomination des trois experts, un par le Tribunal qui doit connaître le litige, un par chacune des parties, sans obligation de nationalité ; si les parties n'avaient pas désigné leurs experts dans un certain délai, le Tribunal y suppléerait d'office ;

2. Traduction des Rapports et de l'interrogatoire de l'équipage par des traducteurs jurés autres que les courtiers maritimes ;

3. Compétence de juridiction et de procédure, telle qu'elle existe dans chaque pays pour juger les faits maritimes jusqu'en dernier ressort, en France jusqu'à l'arrêt d'appel, et dans les autres pays par analogie.

Une fois l'arrêt rendu, la partie qui se croirait, malgré les précautions prises que nous avons indiquées, soit pour la traduction, soit pour l'examen des faits, être mal jugée, se pourvoirait devant le Tribunal Supérieur Internationale, qui jugerait, tant en fait qu'en droit, le litige, et transmettrait par la voie diplomatique au Ministre compétent du pays de la partie condamnée, une expédition traduite de la sentence fidale. Cette dernière serait exécutée à la requête de la partie conformément aux lois du pays et dans les mêmes formes que l'exécution des arrêts souverains émanant de la juridiction nationale.

Le pourvoi devant le Tribunal Supérieur International ne serait pas suspensif, l'arrêt serait exécutoire par provision, si provision n'avait déjà été faite ; signification du pourvoi serait faite dans les vingt-quatre heures au domicile de l'intimé, domicile indiqué dans l'arrêt ; le délai de pourvoi serait d'un mois à partir de la signification de l'arrêt, d'avoué à avoué, ou au domicile indiqué du lieu où l'arrêt a été rendu.

Les parties feraient élection de domicile, si elles étaient étrangères, au Consulat du lieu de juridiction ou du lieu le plus rapproché qui aurait un Consulat.

La transmission de la sentence souveraine par le Président du Tribunal Supérieur équivaudrait à une demande d'exequatur qui, en vertu du règlement ou du pacte international, ne pourrait jamais être refusé.

Pour les collisions entre navires de guerre ou entre un navire de guerre ou assimilés, et un navire de commerce, l'examen de l'affaire ressortirait directement du Tribunal Supérieur International, sans passer, bien entendu, par les Tribunaux Nationaux.

Les procès-verbaux et tous les documents conservatoires pour pouvoir ouvrir plus tard l'instance

de devant le Tribunal Supérieur ou autre, seraient faits à la chancellerie du Consulat ou du Vice-Consulat de pavillon ; cependant, s'ils étaient faits contradictoirement, on procéderait devant le Tribunal compétent du lieu, qui nommerait un expert et les parties, chacun un ; ces derniers feraient les constatations, évalueraient les dommages ; le navire procéderait à ses réparations, &c.

Le Tribunal du lieu n'aurait qu'à donner la sanction légale aux actes, requêtes, et ordonnances qui lui seraient remises ou demandées, en un mot, comme l'on procède en matière d'avaries dans le port de relâche.

Les avaries n'étant réglées que plus tard, au lieu de reste du navire, dans l'espèce ce serait devant le Tribunal Supérieur ; on agirait de même si ce Tribunal du lieu n'était pas compétent pour juger le fond entre navires de commerce.

Il nous semble que de cette façon aucune nation n'aurait abdiqué le droit de rendre de la justice chez elle, conformément à ses lois et à ses mœurs. Le pourvoi devant le Tribunal Supérieur n'aurait certainement pas lieu dans tous les procès, les parties comme les Tribunaux Nationaux étant mieux et plus équitablement éclairées par la Commission d'Experts vraiment internationaux.

On regarderait à deux fois auparavant de prendre une décision, sachant que le Tribunal souverain peut casser la sentence ou l'Arrêt et le modifier.

Cette juridiction suprême ne serait, en un mot, selon nous, qu'un arbitre éclairé, indépendant, d'un conflit d'intérêts internationaux.

Ainsi dans l'affaire du " City of Mecca " avec le bâtiment Portugais " Insulano," il paraît que l'Arrêt rendu à Lisbonne fut loin de donner satisfaction à l'Angleterre ; comment trancher sans froissement cette difficulté, cette défiance ? Par notre système d'experts internationaux, la sentence aurait d'abord pu être différente et ensuite, en admettant qu'elle eut été la même, l'Angleterre, mieux éclairée, n'aurait peut-être pas fait de récrimination ; et si, malgré la Commission d'Experts, elle avait eu quand même un doute sur l'impartialité de l'Arrêt, après avoir épuisé à Lisbonne le dernier ressort, elle se serait adressée au Tribunal Supérieur International qui, sur le vu des documents de la cause, traduits à nouveau par des traducteurs jurés, les faits nouvellement examinés par des experts jurés nommés par lui ; rapport d'experts qui aurait été communiqué aux parties ou, dans un temps fixé, elles auraient eu la faculté de fournir des contredits. La sentence de Lisbonne aurait été maintenue ou réformée en tout ou en partie, et cette nouvelle sentence définitive aurait terminé l'affaire ; tous devant s'incliner au prononcé de ce verdict désintéressé.

Si nous ne nous trompons, le Ministre Anglais à Lisbonne demandait à soumettre le Jugement à une Cour d'Appel Internationale ; notre manière de voir est au fond, sinon dans la forme, pareille à la sienne.

Reste l'examen de la compétence du lieu où le litige doit être jugé.

Le droit de rendre la justice est un droit souverain que les nations n'abdiquent pas avec raison facilement.

Or, un navire qui a commis des dommages ou fait des déprédations à un autre navire est nécessairement justiciable de la juridiction compétente du lieu où les dommages et les déprédations ont été commis, sauf à lui, s'il se trouve mal jugé en dernier ressort, d'en appeler au Tribunal Supérieur International, que nous demandons d'établir. Nous entendons par lieu, la zone territoriale, comme les ports, rades, fleuves, &c., à la condition qu'un des deux navires, le défendeur, sinon tous les deux, s'arrêtant dans un des ports du souverain de la zone, où les dommages ou les déprédations ont été commis, et puisse y recevoir l'assignation ou même la protestation, peu importe son déplacement ultérieur.

Les dommages faits et les déprédations commises à un navire dans la mer libre doivent être justiciables des Tribunaux compétents du domicile du défendeur.

Celui qui a commis un crime ou un délit ou quasi-délit, dans la mer libre, est nécessairement justiciable des Tribunaux respectifs de son pays, le navire dans la mer libre étant la continuation de la patrie, continuation qui cesse et qui doit cesser dès qu'on est chez un autre Souverain, excepté pour les contestations civiles et administratives, entre le capitaine et l'équipage et même les passagers embarqués dans un port du pavillon du navire, le contrat qui lie toutes ces personnes entre elles, n'étant pas un contrat universel mais un contrat spécial, tenant souvent aux lois intérieures d'un État, comme en France par exemple, où par l'inscription maritime, le capitaine ne peut être autorisé à laisser à l'étranger un homme inscrit ; on comprend que si la juridiction du lieu est compétente pour connaître de tous les actes civils que traite un capitaine au point de vue du commerce, en général, et comme conducteur du navire et mandataire de l'armateur. Il n'en est plus de même des contrats qui se forment naturellement par les lois du pays du pavillon, par le seul fait de l'inscription sur le rôle d'équipage. Les hommes ainsi engagés ont accepté la Loi spéciale du pays et les Tribunaux étrangers au pavillon ne sauraient l'interpréter étant censés l'ignorer, sauf les Traités sur les Capitulations.

En matière civile et commerciale pour le sujet qui nous occupe, il y a deux domiciles distincts pour le défendeur : le domicile du propriétaire du navire et le domicile conventionnel du capitaine à son bord, et dans le lieu où se trouve le navire au moment des poursuites, peu importe le déplacement antérieur.

On pourrait nous objecter, que souvent il est difficile de savoir lequel est le défendeur ; nous répondrons qu'à moins que les assignations soient simultanées, il y en a toujours un qui commence, le second n'est donc demandeur que reconventionnellement, et cette dernière qualité ne lui enlève pas celle de défendeur.

Mais nous ferons encore observer que dans les affaires qu'on pourrait nous citer comme les deux parties étant demanderesses, elles ne l'étaient précisément que pour échapper aux Tribunaux étrangers et être jugées par les Tribunaux de leur pays. La chose n'est plus la même ; il n'y a que les Tribunaux du domicile du défendeur de compétents ou ceux du lieu de relâche pour les quasi-délits commis dans la mer libre, et celui du lieu des dommages pour les quasi-délits commis sur le territoire d'un Souverain.

Le domicile ainsi établi, il ne peut y avoir aucune contestation fondée sur le pays qui doit

connaître du litige, parce qu'il est conforme aux droits des gens en ce que le défendeur n'est privé de ses juges naturels que par son déplacement émanant de sa volonté et de sa liberté.

Ce domicile n'empiète sur aucun droit souverain, bien que le demandeur ait le droit pour un quasi-délit commis dans la mer libre, entre le domicile du défendeur et le lieu où relâche le navire poursuivi, ce choix se justifie même par le peu de garantie que pourrait offrir dans certains endroits la juridiction territoriale ; mais ce choix n'aggrave pas la situation du défendeur, puisque c'est devant les Tribunaux de son pays qu'il sera poursuivi s'il ne l'est au lieu de relâche.

Et quant au conflit qui pourrait exister sur la qualité des parties, il ne serait pas à redouter ; ou les Arrêts seraient les mêmes, ou ils seraient divergents ; celui se croirait lésé se pourvoirait devant le Tribunal Supérieur International ; mais, nous. le répétons, nous ne croyons pas au conflit de juridiction, par la seule raison que ce qui les motive actuellement, disparaît par notre système.

Lorsque les dommages auraient été commis en un lieu appartenant à un Souverain, à moins d'un accord des deux parties désignant un autre lieu de juridiction de droit, la juridiction du lieu serait compétente.

Cette manière d'établir la compétence du lieu nous paraît raisonnable et logique, et nous semble donner la satisfaction nécessaire que réclament des intérêts considérables, tout en respectant les droits souverains ; elle offre de rendre une bonne et prompte justice, dont, du reste, si l'on était mal jugé, nous le répétons, le dernier mot appartiendrait au Tribunal International.

Dans certains pays il n'y a pour les collisions qu'un seul degré de juridiction ; en France il y en a deux, cette différence tient uniquement à l'organisation de la procédure dans les différents pays et aussi à la composition du corps judiciaire.

Le mal n'est pas dans un, ni dans deux degrés de juridiction ; il est dans des traductions parfois inexactes, si elles ne sont pas littérales, et dans la Commission d'Experts où l'étranger n'a pas toujours toute la garantie désirable.

On doit désirer aussi la rapidité de la procédure ; pour cela, il faut autant que possible la moins compliquer ; elle ne l'est pas en France ; mas malgré tout, ce qu'il faut, c'est une bonne et impartiale justice ; c'est sans doute quelque chose d'aller vite ; nous estimons qu'en ces matières il vaut mieux encore aller bien.

Ces principes nettement établis ne gêneraient en rien un navire, qui aurait des dommages, pour relâcher, puisque en quelque lieu qu'il se trouverait, il pourrait être légalement arrêté, sans que son Gouvernement puisse élever un conflit ; il n'aurait aucun intérêt à fuir ; le droit d'arrêter un navire existerait sur la présentation de la protestation régulière et, sur requête, tant que l'action ne serait pas prescrite pour la saisie, le Président du Tribunal pourrait en outre exiger caution du saisissant.

Mais nous estimons aussi que le navire qui relâcherait pour plusieurs raisons et dans l'intérêt même du demandeur, pourrait continuer son voyage quitte à donner caution égale aux dommages évalués et jusqu'à concurrence de la valeur estimée par la police d'assurance du défendeur ; qu'il pourrait donner comme caution le nantissement de cette même police d'assurance, en tout ou en partie, et empêcherait la saisie, ou enfin une hypothèque soit du chiffre des dommages estimés, soit de tout le navire, espèce d'hypothèque légale ayant un rang privilégié sur toutes celles existantes, n'ayant avant elle que le privilège de l'équipage et celui des frais qui concouraient depuis le dommage à la conservation de la chose, excepté l'emprunt à la grosse, à moins qu'il fut pour ce dernier emprunt décidé autrement entre les parties.

La transcription de cette hypothèque légale, toute provisoire jusqu'à la fin du litige, serait faite sur l'acte de nationalité par le Consul du défendeur ; s'ils étaient tous les deux demandeurs, ils se garantiraient mutuellement jusqu'à la fin du litige ; de cette façon la cession du navire serait impossible pendant la durée du procès.

Un navire qui serait nanti de l'un des moyens que nous avons décrits, n'aurait aucun intérêt à retenir l'autre dans le port, puisque pour une raison d'intérêt public l'armateur n'est tenu de réparer, civilement, les actes licites ou illicites de son capitaine, que jusqu'à concurrence de la valeur du navire et du fret, sur lequel il faut déduire les privilèges qui l'absorbent presque toujours, Dans l'intérêt général, cette garantie nous paraît suffisante. En Angleterre, elle est fixée suivant le tonnage, et il est prévu une augmentation s'il y a mort d'homme.

Il va sans dire que si le navire ainsi hypothéqué n'était pas assuré, le bénéficiaire de l'hypothèque aurait le droit de le faire assurer à son profit comme s'il en était le propriétaire, et que dans le cas de nantissement par la police et dans celui de perte du navire, dont la police serait donnée en nantissment, la somme due par l'assurance serait déposée avec un privilège spécial, sauf celui de l'équipage et des frais de justice, jusqu'à ce que le litige fut terminé.

En conséquence de tout ce qui précède, la Commission de l'Union Syndicale Mutualiste des Incrits Maritimes du Havre formule les vœux suivants :—

1. Qu'en matière d'abordage, les protestations soient faites conformément et dans les délais prescrits par la loi du pavillon de celui qui proteste, peu importe de quelle juridiction relèvera l'affaire ultérieurement ; nul n'étant censé ignorer la loi de son pays ;

2. Que tous les Tribunaux qui ont dans leurs attributions la connaissance des quasi-délits maritimes, contre navires de même nation ou de nations différentes aient auprès d'eux des interprètes jurés ne pouvant exercer les fonctions de courtiers de navires, ni de mandataires des parties ;

3. Qu'aucune procédure relative à une collision ne puisse venir en délibérée devant le Tribunal compétent, sans être au préalable précédée d'un Rapport fait par une Commission d'Experts, composée de trois capitaines nommés : un par le Tribunal et un par chaque partie ; s'il y avait plus de deux parties, pour que le nombre fut toujours impair. le Tribunal le rendrait impair en nommant deux experts.

Les experts nommés par les deux ou plusieurs parties pourraient être de n'importe quelle nationalité, à la condition toutefois d'être capitaines et de parler la langue du Tribunal. Les ingénieurs, constructeurs, &c., servant à évaluer les dommages, n'auraient pas voix délibérative au Rapport ; ils seraient adjoints aux experts pour fixer les sommes seulement, et sous la responsabilité de ces derniers.

La minorité d'experts opposante aurait toujours la faculté de motiver son opposition dans le Rapport

4. Que l'incompétence du lieu de juridiction en matière d'abordage soit :—(1) le Tribunal attributif du lieu où le quasi-délit a été commis ; (2) le Tribunal attributif du domicile de l'armateur ; (3) le Tribunal attributif de lieu de relâche du navire, au moment des poursuites, peu importe, tout déplacement antérieur ou ultérieur, le choix est au demandeur pour les deux derniers cas ; faculté aux parties pour le premier cas, de désigner, par un acte, le lieu qui doit trancher le litige, s'ils ne doivent pas se faire juger par le Tribunal du lieu où le dommage a été commis ;

5. Que la procédure dans les domiciles sus-indiqués et dans le lieu où les dommages ont été commis, soit suivie sous les réserves des vœux 1, 2 et 3, conformément aux lois, règles, et usages du pays, qui rend la justice jusqu'en dernier ressort ;

6. Que tout navire qui est actionné en réparations de dommages causés par lui, soit dans le lieu ou il est actionné, soit dans la mer libre, puisse continuer son voyage et sa navigation en donnant une caution égale à la valeur entière du navire évaluée par sa police d'assurance, ou par trois experts nommés : un par le Consul du demandeur et les autres par chacune des parties, et que la caution soit agréé du demandeur.

Que, de droit, le défendeur puisse offrir comme caution, sa police d'assurance par un transfert motivé, ou bien en donnant une hypothèque légale, un privilège sur le navire n'étant primé que par les frais conservatoires, faits depuis le dommage au jour du réglement définitif.

Cette hypothèque comme le transfert de la police se ferait devant le Consul du défendeur, qui délivrerait au demandeur un duplicata du certificat d'inscription sur l'acte de nationalité indiquant le jour et l'heure, et enverrait ce certificat au port d'attache, afin qu'aucune cession ne puisse être faite légalement ;

7. Qu'un Tribunal Supérieur International jugeant souverainement en fait et droit soit établi en pays neutre, siégeant toujours au nombre de sept membres, Magistrats Internationaux, et composée d'une section d'experts et d'une section de secrétaires (interprètes formant ainsi le Tribunal Supérieur International) ;

8. Que le Tribunal Suprême juge sur requête, sans ingérence d'avocats ni d'avoués, sur la présentation des documents, Jugements, Arrêts, &c. ; toute demande incidente pourrait être jointe au fond. Un nouveau Rapport serait fait sur l'affaire par les experts du Tribunal Supérieur sur le vu des Rapports des capitaines et de l'interrogatoire de l'équipage nouvellement traduits par les secrétaires du Tribunal. Le dit Rapport serait signifié aux parties qui auraient un mois pour le contredire et, après ce délai, le Tribunal prononcerait souverainement sur le tout.

9. Que dans toute appréciation de dommages en matière d'abordage, il y ait un boni de 10 pour cent au profit des hommes d'équipage du navire qui auraient soufferts les dommages par pertes d'effets, chômage, rupture de contrat, excès de travaux, &c., et que dans le cas de blessures graves ou mort d'hommes, un tarif établisse la pénalité et la réparation civile pour chacun de ces accidents ; les blessés et les ayants droit des décédés, auraient un privilège sur l'indemnité accordée au demandeur. Les amateurs auraient à faire couvrir ces nouveaux risques s'il n'aimaient mieux en supporter eux-mêmes la responsabilité.

10. Que si contrairement à notre manière de voir, par suite de Traités Internationaux ou pour d'autres considérations de haute politique, qu'il ne nous appartient pas d'apprécier, les navires postaux étaient assimilés, pour la saisie et autres faits de juridiction, aux navires de guerre et relevaient par suite du Tribunal Supérieur International dans l'intérêt de l'indemnisé, après la sentence prononcée, la subvention postale serait saisissable et par privilège jusqu'à concurrence de l'indemnité, intérêts et dépens accordés au demandeur.

Tels sont les vœux que formule la Commission de l'Union Syndicale Mutualiste des Inscrits Maritimes du Havre.

Appendix (E).

Report of Committee upon Division XIII.

Collisions en Mer.

[Première Partie.—*Législation Maritime Internationale.*

Note sur les Tribunaux Maritimes Internationaux, Étude de M. Favier, Avocat. Opinion du Gouvernement des États-Unis; Congrès de Milan et de Hambourg; Responsabilité des Compagnies. Commandant Albert Riondel, Officier de la Légion d'Honneur.

À M. Favier, Avocat du Barreau de Cherbourg:

JE vous dédie cet opuscule en témoignage de mon amitié. Vous avez bien voulu mettre votre expérience et votre science du droit au service de la question internationale des Tribunaux Maritimes. Je vous en remercie très affectueusement.

Sentiments les plus dévoués,
(Signé) ALBERT RIONDEL.

Préface.

Au mois d'Août 1883, nous avons étudié la collision du paquebot Français "Saint-Germain" avec le bâtiment Anglais "Woodburn" remorqué par le "Recovery." Nous avons fait de cette étude une brochure. Nous l'avons adressée a divers Gouvernements et aux grandes Chambres de Commerce Françaises de Paris, Bordeaux, Marseille, Le Havre, et Nantes. Nous faisions ressortir dans notre travail le vice de la législation actuelle. Nous demandions la création de Tribunaux Maritimes Internationaux pour juger les litiges résultant des collisions en mer entre bâtiments de nationalités différentes.

Le Gouvernement des États-Unis et le Gouvernement de Grèce approuvèrent le principe et l'utilité de cette création. Les cinq Chambres de Commerce citées plus haut exprimèrent la même opinion. Plus tard, à la suite de dix-sept Conférences faites dans les ports, en 1886, 1887, et 1888, depuis Bayonne jusqu'à Dunkerque, les autres Chambres de Commerce, les Sociétés de Géographie Commerciale et les Conseils Municipaux émirent des vœux identiques.

Ces Corporations dressèrent des Résolutions écrites. Elles les transmirent directement au Gouvernement Français. Le Conseil de l'Amirauté fut saisi de la question par l'Amiral Aube, Ministre de la Marine. Ce Conseil émit à l'unanimité un avis conforme à celui des Chambres de Commerce au sujet de ces Tribunaux. L'Académie des Sciences, la Commission des Pétitions de la Chambre des Députés, les Congrès de Nantes, de Hambourg, et de Milan, plusieurs Chambres de Commerce étrangères se montrèrent également favorables. Tous ces documents sont publiés dans deux brochures: la première a été imprimée à Cherbourg en 1886, sous le titre "Réforme Internationale et Tribunaux Maritimes Internationaux." La seconde s'imprime actuellement à Cherbourg chez Biard, 14, Rue du Château; elle a pour titre, "Les Routes Internationales de Navigation," et elle formera la seconde partie de cet ouvrage.

Un avocat de Cherbourg, jurisconsulte réputé dans la Manche et le Calvados, très expert dans les questions maritimes, M. Favier, s'est intéressé à la question qui nous préoccupe. Il avait assisté à la Conférence que nous fîmes à Cherbourg au mois de Juin 1886. Le travail de M. Favier constitue la partie principale de cette brochure. Nous le faisons précéder d'une note sur les Tribunaux Maritimes Internationaux, que nous avons lue au huitième Congrès des quarante-deux Sociétés de Géographie réunies à Nantes, au mois d'Août 1886. Le Congrès émit à l'unanimité un vœu favorable à l'institution de ces Tribunaux.

A la suite du travail de M. Favier, nous insérons le document du Gouvernement des États-Unis, qui a été la base et le point de départ de l'agitation Française dont nous venons de parler. Nous publions après ce document une note relative aux deux Congrès de Hambourg et de Milan qui ont examiné et approuvé les propositions qui leur étaient soumises.

La création des Tribunaux Maritimes Internationaux a été attaqué dans un livre récemment paru sur les collisions en mer. Cet ouvrage est de M. le Commandant Banaré, Chef du Service des Instructions Nautiques. Nous lui répondons dans une note spéciale.

Nous insérons aussi une étude sur la responsabilité des Compagnies de Navigation et la nécessité d'établir un Tarif International protecteur de la vie humaine sur mer.

Nos conclusions sont faites avec beaucoup de réserve. Nous nous bornons simplement à quelques considérations. Notre but est avant tout d'appeler l'attention sur la nécessité de créer, en matière de collisions, des Tribunaux Internationaux à la place des Tribunaux des nationalités, pour régler plus équitablement les litiges entre navires de nationalités différentes.

Le besoin d'une législation nouvelle résulte de l'unanimité des vœux nettement formulés par les intéressés. Le Rapport du Commissaire de la Navigation des États-Unis rend la pensée commune en ces termes: "L'établissement d'un pareil Tribunal épargnerait les dépenses, préviendrait beaucoup d'ennuis et apporterait plus d'harmonie dans l'interprétation donnée par les différentes nations aux lois sur les collisions. Il est probable que toutes les nations favoriseraient l'insertion (au moins en substance) de la deuxième clause proposée par M. Riondel et j'incline à recommander son adoption."

La solution pratique des Tribunaux Internationaux présentera certainement des difficultés, mais elles ne paraissent pas insurmontables à un homme de la valeur et de l'expérience de M. Favier.

D'autres juriconsultes suivront probablement son exemple et essaieront de résoudre la question.

Création des Tribunaux Maritimes Internationaux.

Cette note a été lue, en séance publique, au Congrès de Nantes, le 8 Août, 1886, par M. le Commandant Riondel.

Le Congrès, à l'unanimité, a émis un vœu favorable au projet.

Le principe et l'utilité des Tribunaux Maritimes Internationaux pour juger les litiges entre navires de nationalités différentes ont été reconnus :—

1. Par les États-Unis, le 4 Février, 1885 ;
2. Par la Grèce ;
3. Par la Chambre de Commerce du Havre ;
4. Par la Chambre de Commerce de Paris ;
5. Par la Chambre de Commerce de Bordeaux ;
6. Par la Chambre de Commerce de Marseille ;
7. Par les Congrès d'Anvers et de Milan ;
8. Par le Conseil de l'Amirauté Française, le 25 Avril, 1886.*

Nous avons fait deux Conférences dans les grands ports de commerce de Nantes et du Havre, le 18 Mai et le 3 Juillet, 1886.

Ces deux assemblées ont approuvé l'idée.

M. le Commissaire-Général de la Marine qui présidait la Conférence que nous avons faite au Havre, nous écrivait, le 9 Juillet : "J'estime que, grâce à vos efforts, la question est assez mûre pour passer de la période des idées et des projets, à l'état définitif, c'est-à-dire à un projet de Convention Internationale à discuter par des Délégués de Puissances."

Le Chef du Service de la Marine qui assistait à la Conférence du Sport Nautique de Nantes, le 18 Mai dernier, nous écrivait, le 29 Juin : "Je relis l'organisation que vous proposez pour vos Tribunaux Internationaux d'États ; je la considère comme bonne et pratique. Cela me paraît excellent et je crois que mon avis sera partagé par tous ceux qui examineront sérieusement la question."

Le 16 Juillet, la Chambre de Commerce de Saint-Nazaire nous disait : "L'exécution de votre très intéressant projet est appelée, croyons-nous, à rendre les plus utiles services."

La Chambre de Commerce du Havre ajoutait, le 24 Juillet, dans son dernier paragraphe : "Le Congrès d'Anvers, qui a examiné toutes ces questions, a émis le vœu que les Gouvernements se réunissent et s'entendent pour en faire l'étude."

Un mois auparavant, le Congrès de Hambourg avait examiné nos propositions avec intérêt et pris des Résolutions sur deux points. Le Congrès de Milan de 1883 avait approuvé le principe d'une Cour d'Appel Internationale révisant les Jugements des Tribunaux.

L'Académie des Sciences a été saisie ; elle a nommé une Commission pour étudier l'affaire.

De nombreuses Pétitions signées au Havre, à Cherbourg, Nantes, Paris, Saint-Nazaire, Marseille ont été adressées à la Chambre des Députés. Le dépôt a été fait à la Tribune par un Député de la Loire-Inférieure, M. le Marquis de la Ferronnays.

Cette revue rétrospective indique surabondamment l'intérêt qui s'attache à la question que nous allons présenter brièvement à la haute attention du Congrès.

Le projet n'a rien de définitif. C'est une simple esquisse.

On trouvera une sanction pratique, après examen préliminaire fait par des jurisconsultes, armateurs et membres de Compagnies d'Assurances. Les discussions de la presse éclaireront encore le sujet. Les Délégués des Puissances viendroit ensuite ; ils donneront en dernier ressort la forme internationale voulue, pratique et définitive, utile aux intérêts généraux de toutes les nations.

I.

En droit, nul ne peut être juge dans sa propre cause.

Dans un différend maritime international Anglo-Français par exemple, résultant d'une collision en mer, tous les juges seront Anglais, si le navire incriminé relâche en Angleterre.

Au contraire, si le navire aborde en France, tous les juges seront Français.

En un mot, la composition du Tribunal dépend uniquement du "hasard." Elle influe nécessairement sur la sentence.

La collision du "Saint-Germain" et du "Woodburn," dans la Manche, en 1883, a démontré la nécessité d'un Tribunal International Mixte. Nous en avons fait l'objet d'une brochure qui a été approuvée par le Gouvernement des États-Unis et les autorités citées plus haut.

Nous empruntons ici les expressions du Commissaire de la Navigation, M. Jarvis Patten, dans son remarquable Rapport du 31 Janvier, 1885 : "L'établissement de semblables Tribunaux épargnerait des frais, préviendrait beaucoup de soucis et apporterait plus d'harmonie dans l'interprétation donnée par les différentes nations aux lois sur les collisions."

L'honorable Commissaire de la Navigation dit encore : "Ce serait certainement, de la part des différentes nations adhérentes, un moyen rapide de donner toutes les garanties désirables à la législation."

* Un très grand nombre d'autres Chambres de Commerce, Françaises et étrangères, se sont associées à ce mouvement depuis cette époque.

D'un autre côté, la collision du navire Anglais "City of Mecca" avec le bâtiment Portugais "Insulano" a été l'objet, pendant huit ans, de plaintes et de réclamations diplomatiques de l'Angleterre.

Cette nation trouvait alors que le Tribunal Portugais, dans le Jugement de cette affaire, avait fait un "déni de justice."

Le Ministre Anglais à Lisbonne proposa alors la création d'une Cour d'Appel Internationale devant réviser les Jugements des nationalités.

Le Congrès de Milan de 1883 approuva l'idée et prit une Résolution dans ce sens.

Rien ne serait plus désirable que la création de ces deux degrés de juridiction :—

1. Des Tribunaux Internationaux siégeant sur un certain nombre de points déterminés et limités;

2. Une Cour d'Appel Internationale siégeant en pays neutre, révisant les Jugements des Tribunaux Internationaux de Première Instance.

Cette création nouvelle présentera certainement des difficultés de plus d'un genre.

Sont-elles insurmontables? Nous ne le croyons pas. Dans tous les cas, l'importance du résultat, unanimement reconnue en principe, comme nous l'avons vu, n'impose-t-elle pas le devoir de tenter l'entreprise et de ne reculer qu'après avoir fait les plus grands efforts pour réussir? Il s'agit, d'une œuvre de justice à la fois humanitaire et civilisatrice au premier chef.

Pourquoi n'obtiendrait-on pas une entente sur ce point capital, qui doit tenter et attirer toutes les bonnes volontés, quand on est arrivé à la faire aboutir des Conventions Internationales aussi ardues et minutieuses que des Conventions de Pêche, Postales, Télégraphiques, et autres?

Les difficultés s'aplaniraient avec du temps, de la persévérance, du travail, et la volonté de réussir.

Pourquoi, en un mot, une barrière infranchissable s'élèverait-elle de ce côté seulement, quand nous ne la voyons nulle part ailleurs?

II.

En Angleterre, les litiges contentieux des collisions sont jugés dans la capitale, à Londres, par "l'Admiralty Court." Il y a un juge et deux assesseurs, capitaines choisis dans la Corporation du "Trinity House."

En France, au contraire, ces affaires appartiennent aux Tribunaux de Commerce.

Si la marine Anglaise, qui dépasse comme nombre, la moitié des autres marines du globe, se contente d'une seule Cour établie dans sa capitale, on peut l'imiter sans crainte; cela simplifie la difficulté et permet de fixer le nombre et le siège des Tribunaux Internationaux.

Ils seraient établis dans chacune des capitales des pays ayant adhéré à la Convention Internationale.

Dans le cas d'un litige Anglo-Français, à juger en Angleterre par exemple, le Tribunal serait international au lieu d'être national. Le Jugement serait rendu par trois juges, au lieu d'un juge unique; un juge de chacune des parties intéressées et un juge étranger, pris sur un tableau des nations ayant adhéré à la Convention.

Le nombre des juges augmenterait avec celui des parties intéressées. Chacune doit être représentée. Dans tous les cas, le nombre des juges devra rester impair.

Dans le cas que nous venons d'examiner, un litige se jugeant en Angleterre, le Jugement serait rendu naturellement dans la langue Anglaise. Tout le personnel nécessaire à la justice resterait le même. Il n'y aurait de changé qu'un seul élément: la composition des juges. Mais c'est là le point capital qui donnerait aux parties les garanties d'impartialité qui leur font défaut aujourd'hui.

Les difficultés nous paraissent donc plus apparentes que réelles. Les Plénipotentiaires délégué sauront bien les surmonter et cimenter les bases de l'organisation nouvelle. Il faut éviter à l'avenir, comme le dit avec tant d'àpropos M. Jarvis Patten: "que des Jugements, même quand ils sont justes, soient suivis de soupçons et de récriminations. On permettra alors à un commandant, en pareil cas, de relâcher dans le port le plus voisin (manœuvre dictée par l'humanité quand la vie humaine est en danger), sans craindre de nuire à ses intérêts."

L'honorable Commissaire de la Navigation des États-Unis s'exprimait ainsi dans la dernière phrase de son Rapport: "Il est probable que toutes les nations favoriseraient l'insertion (au moins en substance) de la deuxième clause proposée par M. Riondel, et j'incline à recommander son adoption."

On ne peut pas approuver la création des Tribunaux Maritimes Internationaux d'une manière plus catégorique. Le Chef du Département de la Trésorerie et le Secrétaire d'État des États-Unis approuvaient le Rapport de leur Commissaire de la Navigation (le 4 Février, 1885), dans une phrase laconique, bien expressive, écrite à M. Riondel: "J'ai l'honneur de vous transmettre la copie d'un Rapport du Commissaire de la Navigation, qui exprime ses idées sur ce sujet, idées auxquelles le Département donne pleinement son assentiment."

La nation des États-Unis est essentiellement maritime et possède le sens pratique des choses. Elle a démontré, dans le Rapport de son Commissaire de la Navigation, l'urgence de la réforme. Comment ne pas être convaincu, après cette lecture, que la vérité est là, et que le reste n'est plus qu'une question secondaire qui sera résolue quand on le voudra?

III.

Les Ordonnances de 1861 (Livre IV, Titre 9, Article 18) et du 29 Octobre, 1833 (Article 62), imposent aux autorités Maritimes et Consulaires le devoir de rechercher les causes des sinistres maritimes. Une instruction du Ministre de la Marine, en date du 18 Mai, 1860, a précisé leurs devoirs, un questionnaire adopté par une autre décision du 24 Mai, 1879, a donné de l'uniformité à ces investigations; on ne doit pas se borner à lire aux témoins de l'événement le Rapport du capitaine. L'enquête doit être approfondie. Il faut arriver à la découverte de la vérité par tous les moyens

possibles. Les Commissaires de l'Inscription Maritime et les Consuls procèdent à cet effet à l'examen des papiers de bord et du casernet; on interroge et on presse de questions l'équipage et les passagers. On a recours à des experts assermentés. Dans les Consulats, on réclame l'assistance d'un officier de vaisseau, si un navire de guerre est dans le port ou sur rade; ou bien encore, du plus âgé des capitaines au long cours présents dans la localité.

En France, le Commissaire de l'Inscription Maritime appelle à l'enquête le Directeur des Mouvements du Port ou le Capitaine du Port.

Lorsque les naufrages ont lieu à l'étranger, l'instruction est transmise au Ministre de la Marine, par le Consul qui fait connaître les ports sur lesquels les hommes rapatriés ont été dirigés.

A leur arrivée en France, ces personnes sont soumises à un nouvel interrogatoire, sur tous les points où elles abordent dans la mère-patrie.

Ainsi donc, il existe deux catégories d'enquête très différentes; les unes sont faites dans le Consulat le plus rapproché du lieu du sinistre; les autres sont dressées à l'arrivée sur le sol natal.

Il serait rationnel, si la collision est Anglo-Française, par exemple, que le Consul Anglais assistât à l'enquête Française, et réciproquement. Il y aurait ainsi des garanties indéniables de justice. Le Consul assistant aurait droit d'interrogatoire et d'inscription au procès-verbal.

Au point de débarquement, le contrôle de l'enquête serait toujours possible, car il y a dès Consuls dans la localité même du débarquement de l'équipage ou sur un point très rapproché. On avertirait ce Consul du jour et de l'heure de l'interrogatoire.

A l'étranger, sur le lieu de la collision, si un des Consuls faisait défaut, il pourrait être substitué par un Consul d'une autre nationalité, ou par un officier d'un navire de guerre présent sur les lieux, ou par le capitaine au long cours le plus ancien, ou bien encore par un Notable. Ceux-ci remplaceraient le Consul manquant.

Les marins et armateurs trouveraient certainement dans cette double enquête contrôlée par les intéressés, au moment de l'événement et peu de temps après, des garanties précieuses qui n'existent pas aujourd'hui.

Cet important dossier formerait la première assise. Envoyé au Tribunal Maritime International, il lui rendrait d'utiles services.

IV.

Nous n'avons pas voulu entrer dans les détails. Un peu plus tard, quand la question aura été discutée par les intéressés et par la presse, il nous restera à formuler, Article par Article, dans un projet spécial, les diverses idées qui sont exprimées dans ce Mémoire.

Sans chercher à nier les difficultés qu'on rencontrera sur sa route pour résoudre le problème, afin d'arriver à une entente internationale, nous avons eu pour but de montrer au Congrès que ces obstacles ne sont pas insurmontables. Le sentiment du bien public et l'amour de la justice seront le levier puissant qui, un jour donné, nous l'espérons, soulèvera toute la charge et rendra ce grand service à la civilisation.

Dans sa délibération du 13 Juillet, 1885, la Chambre de Commerce de Paris, statuant sur les propositions que nous avions soumises à son examen, émettait un avis "tendant à ce que le Gouvernement s'entendit avec les Gouvernements étrangers pour résoudre ces questions internationales de si haut intérêt."

Nous avons vu plus haut que le Congrès d'Anvers de 1885 avait émis le même vœu

Nous demandons respectueusement au Congrès de Nantes de vouloir bien prendre une résolution semblable.

La Chambre de Paris avait fait précéder son vœu des considérants suivants:—

"La Chambre de Commerce a constaté la difficulté de déterminer le Tribunal compétent pour connaître d'une collision en mer entre navires de nationalités différentes, et les conséquences graves qui en résultent, les Codes Maritimes n'étant pas identiques.

"La Chambre de Commerce estime, en conséquence, que non seulement la création de Tribunaux Internationaux s'impose pour les besoins de la grande famille du monde commercial, mais qu'il conviendrait surtout que toutes les nations eussent un même Code Maritime."

Le Conseil d'Amirauté, dans sa séance du 25 Avril, 1886, avait émis un vœu analogue: "Qu'il serait du plus sérieux intérêt qu'un accord pût être réalisé entre les diverses nations maritimes pour la constitution de Tribunaux Internationaux chargés de connaître les litiges entre navires de nationalités différentes, et de les juger d'après une loi commune."

Le Gouvernement Grec a adopté aussi la même proposition et s'est déclaré "tout disposé à prendre part aux travaux de la Conférence, quand les Puissances Maritimes auront décidé d'en convoquer une."

Dans notre Mémoire "Sur la Réforme de la Loi Internationale du 4 Novembre, 1879, et la Création de Tribunaux Maritimes et Internationaux," nous avons proposé (page 9) la nomination d'une Commission Permanente de personnes techniques.

Elle préparerait la solution de ces questions internationales d'un si haut intérêt; elle étudierait avec soin les collisions nouvelles où elle trouverait un enseignement salutaire pour les prévenir à l'avenir.

Ne serait-ce pas un moyen de faciliter plus tard l'œuvre des Plénipotentiaires délégués de la Conférence Internationale? Ces derniers auront à mission de créer définitivement une entente sur cette question importante. Comme le dit la Chambre de Commerce de Paris; "la création de ces Tribunaux s'impose pour les besoins de la grande famille du monde commercial."

Cherbourg, le 31 *Juillet,* 1886.

M. le Commandant, *Cherbourg, le 7 Janvier*, 1887.

Voici la note que je vous avais promise.

Elle n'a pas la prétension d'être complète, mais c'est un aperçu des moyens qui me semblent le plus pratiques pour mettre vos idées en application, en ce qui touche l'organisation et la juridiction des Tribunaux Internationaux.

Il importe de démontrer que cette institution n'a rien d'irréalisable, même au point de vue du courant ordinaire des affaires.

C'est ce que j'ai essayé de faire.

Veuillez, &c.

(Signé) H. FAVIER.

A. M. le Commandant A. Riondel.

Étude sur l'Organisation et la Juridiction des Tribunaux Maritimes Internationaux; par M. H. Favier Avocat.

La nécessité d'une juridiction internationale pour les abordages n'est plus à discuter; elle s'impose. Mais si elle est admise par tous en principe et en théorie elle n'en soulève pas moins certaines objections au point de vue pratique.

Tous les hommes d'affaires qui se sont occupés spécialement de questions maritimes savent qu'en pareille matière un avantage qu'on ne saurait légèrement sacrifier c'est la célérité. C'est surtout dans le commerce maritime qu'on doit tenir compte de l'adage Américain "Time is money." L'importance des intérêts engagés dans les armements est considérable et un rétard de quelques jours dans l'accomplissement du voyage pour lequel un navire est affrété, peut porter une grave atteinte à des intérêts nombreux. Non seulement le capitaine et l'équipage mais les armateurs, les chargeurs, les assureurs, et souvent d'autres encore peuvent en éprouver de sérieux préjudices.

Aussi il est un écueil qu'il faut éviter en organisant en cette matière une nouvelle juridiction, c'est de la placer trop loin des justiciables.

Un abordage survient, le navire abordé relâche dans le plus voisin. Il faut qu'il y trouve immédiatement une autorité ayant qualité pour constater l'avarie, sa nature, en rechercher les causes, prescrire et surveiller les réparations, et mettre le navire à même de continuer son voyage le plus tôt possible, ou constater son innavigabilité irrémédiable, afin que le chargement puisse être transbordé sur un autre navire. Il peut aussi y avoir des mesures urgentes à prendre pour assurer le sauvetage ou la conservation de la cargaison. S'il fallait, pour toutes ces mesures, recourir à un Tribunal éloigné, les dommages résultant de l'abordage seraient considérablement aggravés par les retards et les frais qui en seraient la conséquence inévitable.

Or, les Tribunaux Internationaux seront nécessairement peu nombreux, et par suite siégeront à des distances très considérables. Il n'est pas possible d'admettre que pour toutes les questions signalées plus haut on doive recourir à leur intervention.

Aussi, le Soussigné estime-t-il qu'il n'y aurait pas lieu de leur attribuer compétence pour toutes les mesures d'instruction, qui, pour être efficaces, doivent s'effectuer sans retard et sur les lieux mêmes de relâche.

Il serait possible de concilier l'intérêt d'une bonne justice, avec l'intérêt d'une prompte justice, en restreignant le rôle des Tribunaux Internationaux au jugement des questions de responsabilité, et en laissant aux Tribunaux Nationaux existant actuellement le soin de présider aux mesures de conservation et d'instruction, sauf à donner aux étrangers, dans cette première phase de la procédure, quelques garanties que les législations actuelles ne leur donnent pas.

En conséquence, le projet de Traité à soumettre aux délibérations des diverses Puissances pourrait être formulé ainsi qu'il suit:—

TITRE Ier.

Article 1er. En cas d'abordage, chacun des capitaines devra, dans le délai de vingt-quatre heures, déposer au greffe du Tribunal du lieu où il se trouvera, ou bien du port où il relâchera, un Rapport détaillé relatant toutes les circonstances de l'abordage.

Dans le cas où il y aurait sur les lieux un Consulat de sa nation, le capitaine pourra, s'il le préfère, déposer son Rapport au dit Consulat.

Art. 2. Le délai de vingt-quatre heures courra du moment de l'abordage, si l'abordage a eu lieu dans une rade ou dans un port; il courra du moment de l'arrivée du navire dans le premier port où il entrera, si l'abordage a eu lieu en mer.

Art. 3. Le Rapport sera vérifié par les déclarations des hommes de l'équipage et des passagers qui seront interrogés et déposeront, sous la foi du serment, devant le Magistrat ou le Consul qui aura reçu le Rapport.

Art. 4. Les Rapports non vérifiés ne sont point admis à la décharge du capitaine, et ne font point foi en justice, excepté dans le cas où le capitaine s'est sauvé seul dans le lieu où il a fait son Rapport. La preuve des faits contraires est réservée aux parties.

Art. 5. Le même Magistrat ou Consul fera en outre, d'office, toutes les constatations qu'il jugera utiles à la manifestation de la vérité.

Art. 6. Il sera surtout dressé procès-verbal, dont une expédition sera remise au capitaine avec une expédition de son Rapport.

Art. 7. Si les deux navires se trouvent dans le même lieu, le capitaine le plus diligent assignera

l'autre devant le Tribunal du lieu, compétent d'après la loi locale, pour les affaires maritimes, aux fins de faire nommer des experts chargés de visiter les deux navires, de constater les avaries, d'en rechercher les causes, et de donner leur avis sur les responsabilités encourues. Les experts auront la faculté de s'entourer de tous renseignements et de demander, s'ils le jugent utile, de nouveaux éclaircissements aux hommes des deux équipages et aux passagers.

Art. 8. Les mêmes experts auront pour mission d'indiquer les mesures à prendre, s'il y a lieu, pour le sauvetage des navires ou des chargements ainsi que pour leur conservation.

Ils indiqueront aussi, s'il y a lieu de déclarer l'innavigabilité des navires, ou, dans le cas contraire, les réparations nécessaires pour les remettre en état.

Art. 9. Les experts seront au nombre de trois ; chacun des capitaines pourra en désigner un ; le troisième sera choisi par le Tribunal, qui désignerait aussi les autres dans le cas où ils n'auraient pas été désignés par les capitaines.

Aucune condition de nationalité n'est exigée des dits experts.

Art. 10. Après le Rapport des experts, le Tribunal statuera sur l'homologation de leur Rapport, mais seulement en ce qui touche les mesures à prendre pour la réparation ou la conservation des navires et de leurs cargaisons.

Il prescrira en outre, d'office ou sur la demande des parties, toutes les mesures d'instruction qui seraient utiles pour éclairer la question des responsabilités, mais en réservant cette question.

Il statuera enfin sur les demandes d'embargo, et fixera, s'il en est requis, les cautions à fournir par celui des capitaines qui voudra continuer son voyage avant la solution du procès.

Art. 11. Si les deux navires ne se trouvent pas dans le même port, chacun des capitaines poursuivra dans le lieu où il se trouvera, par voie de requête, l'accomplissement des formalités nécessaires pour faire procéder à l'expertise ; mais, en ce qui concerne seulement son navire et sa cargaison. Il en poursuivra l'homologation aussi par voie de requête. L'autre capitaine, comme toute partie intéressée, pourra en tout état de cause intervenir dans la procédure qui deviendrait alors contradictoire.

Art. 12. Les Jugements de l'homologation et ceux qui pourraient être rendus sur les incidents de la procédure, seront en premier ressort, mais ils seront exécutoires par prévision, sans caution.

L'appel pourra en être porté devant les Tribunaux Internationaux dont il va être parlé.

Titre II.

Art. 13. Il est institué dans les pays adhérents au Traité, des Tribunaux Internationaux composés d'un Délégué de chacun des États Contractants. La présidence appartiendra au Délégué de l'État dans lequel siégera le Tribunal. Chaque Tribunal élira parmi ses membres un Vice-Président ; il choisira, hors de son sein, un greffier. Il désignera aussi un certain nombre d'avoués, chargés de représenter ou d'assister les parties. Le ministère des avocats sera facultatif.

Art. 14. La présence de cinq membres au moins sera nécessaire pour la validité de leurs Jugements. En cas de partage, la voix du Président sera prépondérante.

Art. 15. Les Tribunaux Internationaux sont compétents pour statuer : (1) sur les appels des Jugements rendus en conformité des dispositions du Titre Ier du présent Traité ; (2) sur les questions de responsabilité en matière d'abordage.

Art. 16. Les appels seront portés devant le Tribunal International dans la circonscription duquel se trouvera le Tribunal dont la décision sera attaquée.

Art 17. Le Tribunal International pourra statuer séparément sur les dits appels ou joindre les incidents au fond.

Art. 18. La question de responsabilité en matière d'abordage sera portée devant le Tribunal International dans la circonscription duquel le demandeur aura suivi la procédure préliminaire mentionnée au Titre Ier.

Dans le cas où les deux capitaines se porteraient respectivement demandeurs devant les deux Tribunaux Internationaux différents, le Tribunal saisi le dernier renverrait l'affaire devant le Tribunal le premier saisi.

Art. 19. L'instance sera introduite et suivie dans les formes usitées dans le pays, pour les procédures commerciales devant les Cours d'Appel.

Art. 20. Lorsque les deux navires appartiendront à des nationalités différentes, si le Délégué de la nation de l'un d'eux se trouve empêché de siéger, le Délégué de la nation de l'autre ne pourra prendre part au Jugement à peine de nullité.

Art. 21. Les Jugements seront rendus sur le vu des rapports de mer, des expertises et autres documents, sans préjudice des vérifications nouvelles et de toutes mesures d'instruction que le Tribunal jugerait utile d'ordonner.

Art. 22. Les décisions des Tribunaux Internationaux seront en dernier ressort et ne pourront être attaqués que pour vices de forme, incompétences, ou excès de pouvoir.

Art. 23. Il est établi une Cour Internationale de Cassation devant laquelle seront portés les pourvois, et qui, le cas échéant, devra procéder aux Règlements de Juges.

Art. 24. Cette Cour sera composée de deux Délégués de chacun des États Contractants. Elle élira parmi ses membres un Président et un Vice-Président. Elle choisira, hors de son sein, un greffier. La présence de neuf membres au moins sera nécessaire pour la validité de ses Arrêts.

Art. 25. Elle statuera sans débat oral, sur le vu des Mémoires, des parties et des pièces de la procédure.

Art. 26. Elle sera saisie par voie d'assignation, et les Arrêts seront rendus sur le rapport d'un Conseiller qui ne pourra appartenir à la nationalité de l'une des parties en cause.

Art. 27. En cas de cassation, la cause sera renvoyée devant un autre Tribunal International.

TITRE III.

Art. 28. Tous les exploits seront signifiés dans la forme usitée dans le pays où la procédure se poursuivra. Ils devront, si la partie interpellée est étrangère à ce pays et n'y a ni domicile réel, ni domicile élu, lui être notifiée soit en parlant à sa personne, soit à son domicile réel à l'étranger, soit à bord du navire où elle est embarquée, soit enfin au Consulat de sa nation.

Art. 29. La procédure préliminaire et la procédure devant les Tribunaux Internationaux, ainsi que tous actes ou procès-verbaux sont également soumis quant à la forme aux Règlements établis dans les pays où ils sont passés.

Art. 30. La procédure devant la Cour Internationale de Cassation fera seule exception à la règle qui précède et fera l'objet d'un Règlement que cette Cour elle-même arrêtera.

Art. 31. Les Jugements et Arrêts rendus en conformité du présent Traité, seront exécutoires dans tous les territoires soumis à l'autorité des États Contractants, sans qu'il soit besoin d'exequatur.

Art. 32. Néanmoins les Arrêts de la Cour Internationale de Cassation ne pourront être mis à exécution dans chaque État qu'après qu'une expédition en due forme, accompagnée, s'il y a lieu, d'une traduction, aura été soumise, dans le pays où devra se faire l'exécution, au visa de l'autorité qui sera désignée à cet effet par chacun des États Contractants.

Il en sera de même des Jugements rendus par les Tribunaux ordinaires ou par les Tribunaux Internationaux, mais seulement dans le cas où ils devront être exécutoires dans le territoire d'un État autre que celui dans lequel ils auront été rendus.

Art. 33. Le présent Traité ne sera pas applicable en matière d'abordage entre deux navires de la même nation, si ce n'est que lorsque les deux navires se trouveront ou relâcheront l'un et l'autre dans un port étranger.

Dans le cas où un seul des navires relâcherait à l'étranger, la procédure préliminaire seule se fera, conformément aux dispositions ci-dessus, dans le lieu de relâche et la question du fond sera portée devant la juridiction nationale des dits navires.

Opinion du Gouvernement des États-Unis.

Le document Américain a été publié dans notre seconde brochure. Nous le reproduisons, à cause de son importance, dans ce volume, où sa présence est nécessaire. Ce rapport a été la cause et le point de départ de l'agitation Française dans la question des abordages :—

"*Légation des États-Unis, Paris, le* 13 *Avril,* 1885.

"Par une lettre en date du 15 Décembre, 1884, vous avez bien voulu m'adresser un travail sur les collisions en mer, dont l'objet était de suggérer diverses modifications à la Loi du 4 Novembre, 1879.

"Vous me demandiez de soumettre ce travail à l'appréciation de mon Gouvernement ; je l'ai fait et M. le Secrétaire d'État m'adresse aujourd'hui une copie de la correspondance échangée à ce sujet avec le Secrétaire du Trésor et le Commissaire de la Navigation.

"Vous verrez par cette correspondance, que je m'empresse de vous adresser, que votre proposition a été étudiée sérieusement et dans un esprit tout à fait sympathique.

"Le Ministre des États-Unis,
(Signé) "MORTON.

"A M. Riondel,
"Capitaine de Frégate en Retraite."

(1 Lettre.)

"Monsieur, "*Département de la Trésorerie, le* 4 *Février,* 1885.

"Répondant de nouveau à votre lettre du 19 Janvier dernier qui soumettait une communication de M. Riondel, de la Marine Française, dans laquelle il proposait une réforme des Règlements Internationaux pour prévenir les collisions en mer, j'ai l'honneur maintenant de vous transmettre la copie d'un Rapport du Commissaire de la Navigation qui exprime ses idées sur ce sujet, idées auxquelles le Département donne pleinement son assentiment.

(Signé) "MACCOLLOUGH.

"A l'Honorable Secrétaire d'État."

Rapport du Commissaire de la Navigation.

(2e Lettre.)

"Monsieur, "*Washington, le* 31 *Janvier,* 1885.

"J'ai l'honneur de vous accuser réception de la lettre du Sous-Secrétaire Coon, qui me transmettait, à la date du 24 Janvier, 1885, une communication du Secrétaire d'Etat, accompagnée d'une lettre de la Légation des État-Unis à Paris, et une brochure de M. Riondel, Officier en Retraite de la Marine Française. Dans cette brochure, cet officier décrit les circonstances qui ont accompagnées la collision entre le paquebot Français 'Saint-Germain' et le vapeur Anglais désemparé 'Woodburn' pendant que celui-ci était à la remorque du 'Recovery ;' il donne aussi le Jugement rendu par les Tribunaux.

"Pour répondre à la demande que vous me faites d'un Rapport et de mes vues particulières sur la

matière, j'expose : qu'après avoir examiné les documents qui m'ont été soumis, et lu avec beaucoup d'intérêt le Rapport de M. Riondel, j'estime que la conclusion de ses recherches est de proposer l'addition de deux clauses distinctes à la Loi sur les collisions : la première, relative à la sécurité ultérieure des navires remorqués ; la seconde proposant la création de Tribunaux Internationaux appelés à connaître des cas de collision en pleine mer entre bâtiments de différentes nations.

" La première clause, demandée comme une garantie nouvelle, pour les navires remorqués, pour éviter les chances de collisions, est la suivante :—

" Tout navire, à voiles ou à vapeur, qui rencontre un groupe composé d'un navire remorqueur ayant quelque chose à la remorque, doit changer sa route toutes les fois que les directions du bâtiment isolé et du groupe se croisant de manière à entraîner des risques d'abordage.

" Les règles établies ci-dessus pour des bâtiments à vapeur isolés, sont applicables à des groupes qui se trouveraient dans la position des premiers par rapport aux seconds.

" Le Jugement du ' Saint-Germain ' et du ' Woodburn ' semble prouver que l'application des mêmes règles, d'une part, à des bâtiments entièrement libres de faire la meilleure route pour éviter un abordage et, d'autre part, à des bâtiments en ayant d'autres à la remorque et n'étant pas complètement maîtres de leurs mouvements, est arbitraire et pourrait être modifiée.

" Il est raisonnable de stipuler que le navire isolé, parfaitement libre de ses mouvements, doit s'éloigner du groupe qui, forcément, n'est maître qu'en partie de ses mouvements.

" Je pense donc que la proposition de M. Riondel d'ajouter cette clause au Code International est digne d'être prise en considération.

" Quant à la proposition de M. Riondel d'établir des Tribunaux Internationaux qui connaîtraient des collisions en pleine mer entre des bâtiments de nationalités différentes, on peut dire que la question de juridiction est encore incertaine, pour beaucoup de cas, chez les nations maritimes. Elle engendre parfois beaucoup de mécontentment chez les deux parties en cause ; elle occasionne du désordre et des frais.

" En Angleterre, la Cour de l'Amirauté possède la juridiction des procès entre bâtiments étrangers qui s'abordent dans les eaux territoriales.

" Mais quand le fait se produit à plus de 3 milles des côtes du royaume, il n'existe pas d'autre procédé que d'arrêter, partout où on peut le trouver, le navire qui a causé le plus grand dommage, et de lui intenter une action.

" Cette manière de faire donne naissance à des discussions pour savoir quel est le Tribunal convenable, ce qui soulève un grand nombre de plaintes, de dénis de justice dans la procédure.

" Il y a peu de temps, un navire American fut arrêté dans un port Français pour une collision avec un navire Autrichien, collision qui s'était produite quelques mois auparavant dans l'Océan Pacifique. Le navire Américain se rendait au Havre ; l'Autrichien à Lisbonne, où son chargement était assuré.

" Les assureurs de la cargaison, qui firent le plus de bruit, voulaient que le cas fût jugé à Lisbonne, tandis que les propriétaires du navire maltraité préféraient les Tribunaux Autrichiens.

" Il y avait par suite, engagés dans cette affaire, les sujets des quatre nations : les États-Unis, le Portugal, l'Autriche, et la France (pays où le bâtiment American fut saisi).

" Après des négociations considérables et de grandes dépenses, il fut agréé que le cas serait soumis à un Tribunal Français qui devait être, sans aucun doute, moins influencé par des préférences nationales ; aucun citoyen Français n'ayant d'intérêts pécuniaires dans cette affaire.

" Mais si le bâtiment American avait relâche à Lisbonne et qu'il eût été chargé pour un port d'Autriche, il aurait été arrêté et jugé avec un Code différent, comme cela pouvait être, par l'un ou l'autre Tribunal.

" Les propriétaires, placés dans un port d'Amérique, auraient pu craindre que justice ne fût pas faite.

" Le cas du ' Saint-Germain ' et ' Woodburn ' est cité par M. Riondel comme étant un de ceux où le Jugement a causé un préjudice, par un verdict favorable à une des parties dont la nationalité était celle du pays qui jugeait le litige. Sa proposition d'un Tribunal Mixte est faite en vue d'éviter à l'avenir, que des Jugements, même quand ils sont justes, soient suivis de soupçons et de récriminations.

" La proposition de M. Riondel d'avoir un Tribunal Maritime International pour exercer son autorité sur les collisions qui se produisent entre navires de différentes nations, éviterait, je le pense, ce malheur et permettrait à un commandant, en pareil cas, de relâcher dans le port le plus voisin (manœuvre dictée par l'humanité quand la vie humaine est en danger) sans craindre de nuire à ses intérêts.

" On peut cependant faire l'objection qu'un Règlement ou une Loi pour l'institution d'un Tribunal devant juger les cas des collisions, ne doit pas être inséré dans le Code International, qui a seulement pour but de les prévenir.

" Ce serait certainement, de la part des différentes nations adhérentes, un moyen rapide de donner toutes les garanties désirables à la Législation.

" L'établissement d'un pareil Tribunal épargnerait les dépenses, préviendrait beaucoup de soucis et apporterait plus d'harmonie dans l'interprétation donné par les différentes nations aux Lois sur les collisions.

" Il est probable que toutes les nations favoriseraient l'insertion (au moins en substance) de la deuxième clause proposée par M. Riondel dans les Règlements Internationaux et j'incline à recommander son adoption.

(Signé) " JARVIS PATTEN.

" A l'Honorable Secrétaire de la Trésorerie."

Congrès de Hambourg, de Milan, et de Londres.

Les deux Congrès de Hambourg et d'Anvers ont eu lieu en Août et Septembre 1885.

Le Président du premier Congrès, M. le Dr. Sieveking, Président du Tribunal Supérieur des Villes Hanséatiques, dans la première séance, s'exprimait ainsi (compte-rendu officiel, p. 170): "Les propositions faites au Congrès de Milan, en 1883, sont en très grande harmonie avec le projet de M. Riondel, qui mérite la chaleureuse sympathie de tous les membres présents."

Le discours du Président fut suivi de la lecture d'une lettre du Consul-Général de France et d'une note présentée au Congrès par M. Riondel. Nous les reproduisons :—

"M. le Président, "*Hambourg, le* 19 *Août,* 1885.

"M. Albert Riondel, Captaine de frégate en retraite de la Marine Française, a désiré soumettre au Congrès que vous présidez, divers projets de réforme dont il est l'auteur et qui ont pour but de prévenir les abordages en mer et d'assurer le jugement équitable des litiges qui peuvent résulter des collisions entre navires de nationalités différentes. Cet honorable officier ne pouvant, à son grand regret, prendre part, en personne, aux travaux du Congrès, j'ai l'honneur de vous adresser, ci-joint et d'ailleurs à titre purement officieux, le dossier contenant ses propositions, et je ne puis que vous prier de vouloir bien le communiquer à la Commission compétente.

"Ces propositions sont les suivantes :—

"1. Utilité de créer un Tribunal International appelé à connaître des cas de collision, en pleine mer, entre bâtiments de différentes nations. Ce Tribunal serait composé d'un juge appartenant à chacune des nations en cause, et de deux ou trois juges, désignés par le sort, parmi les autres nations ayant adhéré à la Loi Internationale ;

"2. Obligation imposée à tout navire isolé qui recontre, à la mer, un groupe composé d'un remorqueur et d'un ou plusieurs remorqués de s'écarter de la route suivie par ce groupe ;

"3. Obligation d'éclairer la queue des groupes de navires remorqués ;

"4. Responsabilité partielle, en cas de collision, du remorquer qui remorque un ou plusieurs navires sans feu ;

"5. Responsabilité entière et *ipso facto,* en cas de collision, du navire qui n'ayant pas allumé ses feux a ainsi privé l'autre bâtiment du feu légal que le Règlement International lui accorde pour diriger ses mouvements ;

"6. Responsabilité correctionnelle des hommes chargés de l'allumage et du bon état des feux ;

"7. Obligation pour les bâtiments de guerre d'arrêter les navires sans feux et d'en dresser procès-verbal.

"Enfin, 8. Attribution par le Tribunal juge de la responsabilité de l'abordage, de dommages et intérêts à accorder non seulement aux propriétaires des bâtiments et de la marchandise, mais encore aux victimes de la collision ou à leurs ayants-droit.

"Veuillez, &c.

(Signé) "Comte BALUS D'AVRICOURT,

"*Le Consul-Général de France.*"

"*Note présentée au Congrès International de Hambourg en* 1885.

"Dans une brochure publiée en 1884 (sous le pseudonyme de 'Albert du Hailly'), chez Léon Vannier, Éditeur, à Paris, 19, Quai Saint-Michel, et intitulée : 'Collision du "Saint-Germain" et du 'Woodburn,"' j'ai fait les deux propositions suivantes :—

"1. Utilité de créer un Tribunal International pour juger les litiges maritimes.

"2. Obligation imposée à tout navire isolé qui rencontre à la mer un groupe (composé d'un remorqueur et d'un ou plusieurs remorqués) de se déranger de sa route afin d'éviter une collision.

"Premier Point. La juridiction dépend aujourd'hui uniquement du hasard. Dans le cas d'une collision entre Français et Anglais la juridiction sera Anglaise ou Française, selon que le bâtiment auteur de la collision aura relâché en pays Anglais ou sur le sol Français.

"La sentence est toujours attaquée par la partie condamnée avec une certaine apparence de raison.

"Il est de principe en droit qu'on ne peut pas être à la fois juge et partie ; un Tribunal International ne serait-il pas une chose désirable et un progrès réel ?

"Deuxième Point. Un groupe est dans l'impossibilité de manœuvrer et d'éviter un danger ; chaque navire qui en fait partie est tenu par l'avant et l'arrière, et n'a pas (sauf le remorqueur) la possibilité :

"1. De stopper.

"2. D'augmenter ou de réduire la vitesse.

"3. De marcher en arrière.

"4. De faire une abattée pratique, prompte et accentuée, pour éviter un danger.

"En dehors de ces deux propositions nettement formulées, j'avais également émis (dans plusieurs passages de la brochure) les idées suivantes :—

"1. Nécessité d'éclairer la queue d'un groupe. La raison est simple. Les trains de chemins de fer sont éclairés en tête et en queue ; cependant ils ne sont jamais, comme sur mer, susceptibles d'être abordés à droite ou à gauche. Cela s'impose bien plus fortement aux groupes qui sont de vrais trains maritimes.

"2. Si les feux ne sont pas allumés la responsabilité entière, en cas de collision, devrait incomber *ipso facto* à ce navire. Quelle que soit le manœuvre de l'autre bâtiment, celui-ci ne peut pas

en être déclaré responsable, puisqu'il a été privé du feu légal que le législateur lui accorde pour diriger ses mouvements.

" 3. Le législateur international devrait imposer aux bâtiments de guerre le devoir d'arrêter les navires sans feux et d'en dresser procès-verbal.

" 4. Le remorqueur (qui remorque un navire ou des navires sans feux) commet une négligence qui doit le rendre en partie responsable de la collision.

" 5. Les hommes chargés de l'allumage et du bon état des feux, et qui manquent à ce devoir sacré, doivent être punis, le cas échéant, de la même manière que le garde-barrière, l'aiguilleur, le Chef de Gare, ou un employé quelconque, quand il arrive une rencontre sur les voies ferrées.

" Si la responsabilité du capitaine est engagée, il doit être puni aussi. Ces trois dernières clauses s'imposent au nom de la sécurité générale.

" La Loi Internationale du 4 Novembre, 1879, a été faite pour prévenir les abordages à la mer. Elle doit toujours rester ouverte au progrès. Chaque événement malheureux devrait être étudié avec soin, et servir d'enseignement pour l'avenir. Il est nécessaire que l'expérience si chèrement acquise ne soit pas perdue.

(Signe) " A. RIONDEL."

Le Congrès de Milan mit en relief un point intéressant. Une collision eut lieu en 1885 entre le navire Anglais " City of Mecca " et le bâtiment Portugais " Insulano." Le Jugement rendu à Lisbonne par le Tribunal Portugais n'eut pas l'approbation de l'Angleterre. Pendant huit ans (de 1875 à 1883) une correspondance diplomatique fut échangée à propos de cette affaire entre les deux Gouvernements. Les relations se tendirent au point que Lord Granville prononça les mots de " déni de justice." Sir Robert Morier, Ministre Plénipotentiaire Anglais à Lisbonne, fit à ce moment la proposition d'une Cour d'Appel chargée de réviser les Jugements des Tribunaux des Nationalités.

Le Congrès de Milan, saisi, en 1883, de cette demande, votée à l'unanimité la Résolution suivante :—

" A toutes les Puissances Maritimes incombe le devoir d'adopter un Code unique de lois en matières de collisions sur mer, spécialement en ce qui concerne la juridiction."

Le Congrès de Londres s'est assemblé au Palais de Guildhall du 25 au 29 Juillet, 1887. Le Secrétaire-Général lut dans une des séances une lettre de M. le Commandant Riondel, en disant que son programme avait déjà été approuvé par le Congrès de Hambourg.

Le procès-verbal (p. 190) contient ces deux communications que nous reproduisons :—

" M. le Vice-Amiral Jurien de la Gravière a résumé (dans le compte-rendu de l'Académie des Sciences du 20 Juin, 1887) de la manière suivante, les diverses propositions que je lui avais soumises :

" 1. Imposer aux paquebots à vapeur une route d'aller et une route de retour, afin de diviser le courant unique en deux courants parallèles.

" 2. Déterminer une vitesse maximum dans les canaux étroits en temps de brume.

" 3. Augmenter la portée de l'éclairage et le mettre en harmonie avec les vitesses d'aujourd'hui.

" 4. Établir des Tribunaux Maritimes Internationaux pour juger les litiges entre navires de nationalités différentes.

" Je soumets respectueusement la question à la Conférence de Londres dans les termes adoptées par l'illustre et savant Amiral Jurien de la Gravière.

" Je ne puis pas me placer sur un meilleur terrain et sous un patronage plus recommandable et plus compétent.

" Je crois même inutile de faire une autre note, plus spéciale et plus développée pour la Conférence de Londres. Je me borne à présenter mes nouveaux travaux.

" Qu'il me soit permis, en outre, de recommander particulièrement à la haute assemblée :

" Ma note sur les Tribunaux Maritimes Internationaux, et celle de la modification des couleurs de l'éclairage.

" Une troisième note sur les signaux de brume et l'utilité d'indiquer la route suivie par un avertissement supplémentaire (le clairon).

* * * * * * * *

" Le moyen pratique qui me paraît le plus sûr pour résoudre ces questions est le suivant :—

" Nomination immédiate d'une Commission Technique Internationale (un membre par nation adhérente) ; cette Commission préparerait le travail des diplomates chargés un jour de rédiger le Projet de Loi. On arrêtera ainsi le cours de ces terribles calamités, les collisions en mer, qui croissent et croîtront sans cesse en intensité et en victimes. Il est nécessaire, par un remède énergique et salutaire, d'établir une barrière et de mettre un frein à tant de misères et de douleurs ; elles durent depuis trop longtemps.

" La Conférence de Londres accomplira son œuvre en y mettant un terme.

(Signé) " ALBERT RIONDEL."

L'Assemblée vote à l'unanimité la Résolution suivante :—

" L'attention des autorités compétentes des Puissances Maritimes doit être appelée sur l'importance de punir toutes les infractions au Règlement qui exige un éclairage convenable sur mer."

C'est exactement la sixième proposition que nous avions faite, en 1885, au Congrès de Hambourg.

Les Tribunaux Maritimes Internationaux jugés par le Chef du Service des Instructions Nautiques.

Les Tribunaux Maritimes Internationaux comptent comme adversaire : M. le Chef du Service des Instructions Natiques de la Marine.

Dans son ouvrage sur les collisions en mer récemment publié, il a attaqué cette institution en disant qu'elle était irréalisable.

Nous lui avons répondu en ces termes dans le "Cosmos."

M. le Chef du Service des Instructions Nautiques, au Service Hydrographique de la Marine, a fait paraître récemment le second tome de son ouvrage sur les collisions en mer. Comme le précédent, ce volume sort de l'Imprimerie Nationale. Les fonctions de l'auteur et le nom de l'imprimerie donnent à cet ouvrage l'apparence d'une attache officielle. Cependant, cette attache n'existe pas. Le volume qui vient de paraître le déclare en ces termes (p. 169):—

"Il ne nous paraît pas inutile de dire en terminant que l'initiative des deux parties de ce travail nous est propre et que personne ne nous en a imposé, et ne pouvait d'ailleurs songer à nous en inspirer la rédaction, non plus que les idées ou arguments qui y sont développés."

C'est heureux assurément; cependant il sera difficile au public et surtout aux étrangers de ne pas faire quelques réserves attendu que le Ministère a favorisé des expériences, fait construire des instruments spéciaux et mis ses archives et ses renseignements officiels sur la matière à l'entière disposition de l'auteur, chef d'un de ses services.

Ce n'est pas tout. Dans la première partie de l'ouvrage, le Chef du Service des Instructions Nautiques déclare: "Qu'il a collationné par la nature de son service tous les documents Français et étrangers."

Il est fâcheux, dans ces conditions, de faire non seulement des oublis, mais des erreurs de faits pouvant tromper et égarer le lecteur. Nous croyons de notre devoir de les mettre en évidence pour tous ceux qui s'occupent de cette cause, et de les signaler en même temps à M. le Ministre de la Marine. Nous ne parlerons, aujourd'hui, que de ce qui concerne les Tribunaux Maritimes Internationaux; nous nous occuperons une autre fois des routes de navigation, pour montrer qu'elles ont été l'objet des mêmes oublis, d'autant plus fâcheux qu'ils ont été peut-être volontaires.

A la page 106 de son second volume, l'auteur dit que les deux Chambres de Commerce de Bordeaux et de Dunkerque sont opposées à la création de Tribunaux Maritimes Internationaux. Nous allons édifier le lecteur à ce sujet. Voici la délibération de la Chambre de Bordeaux (22 Juillet, 1885):—

"La Chambre, partageant l'opinion de son Rapporteur, décide que la lettre suivante sera écrite à M. Riondel:—

"'Monsieur,

"'La Chambre de Commerce de Bordeaux a examiné votre communication avec intérêt; elle en apprécie le mérite et joint son approbation à celle que le Gouvernement des Etats-Unis a donnée aux deux propositions que vous formulez relativement aux mesures à prendre pour éviter les collisions, et à la formation de Tribunaux Maritimes Internationaux.

"'Le Président de la Chambre,
(Signé) "'HUBERT PROM.'"

La Chambre de Commerce de la Rochelle (dans sa délibération du 12 Mai, 1887), à la suite de considérants, émet le vœu:

. . . . Que le Ministère du Commerce et de l'Industrie, après entente avec les autres Ministères compétents, prenne l'initiative de Conférences Internationales avec les Représentants des seize Puissances Maritimes qui ont adhéré au Règlement sur les moyens de prévenir les abordages. Ces Conférences devront avoir pour objet:—

1. * * * * * * *
2. * * * * * * *
3. L'établissement de Tribunaux Maritimes Internationaux chargés de juger les contestations ayant pour cause les collisions en mer entre navires de nationalités différentes; Tribunaux qui seraient composés à la fois de Juges de la nationalité de chaque partie et de Juges étrangers à l'une et à l'autre, pour départager au besoin les premiers.

Le Président de la Chambre,
(Signé) MOREL.

A la page 105 du même volume, le Chef du Bureau des Instructions Nautiques dit également que la Chambre de Commerce de Dunkerque ne veut pas non plus de ces Tribunaux Maritimes Internationaux. C'est une nouvelle erreur. Le 17 Juin, 1887, la Chambre de Commerce, par l'organe de son Président, M. Petit, s'exprime ainsi:—

"Quant aux Tribunaux Maritimes Internationaux, leur création serait appelée à rendre les plus grands services, et mettrait fin aux difficultés résultant du régime adopté jusqu'ici. C'est ainsi qu'en matière d'abordage, les Juges appelés à se prononcer sont ceux du pays où relâche le native abordeur. Or, les Codes Maritimes des diverses nations n'étant pas identiques, des Jugements différents peuvent être rendus des faits analogues, suivant la nationalité des Juges qui en connaissent. Il y a là évidemment une situation anormale qu'il importe de modifier. La creation de Tribunaux Internationaux, devant lesquels seraient portés les litiges maritimes, en tranchant tout d'abord la question de compétence, donnerait sur ce point aux intéressés toutes les garanties que la justice doit leur fournir; elle aurait ensuite pour conséquence d'amener tôt ou tard la réforme des Codes Maritimes dans le sens de l'uniformité, et c'est là un but auquel on doit tendre dans l'intérêt de la marine.

"Dans ces conditions, M. le Président propose à la Chambre d'appuyer auprès du Gouvernement les vœux formulés par M. le Commandant Riondel.

"La Chambre consultée adopte cette proposition.

"Le Président,
(Signé) "A. PETIT."

Voilà qui est catégorique, mais continuons :—

A la page 107, l'auteur ajoute que plusieurs autres Chambres de Commerce sont du même avis que celles de Bordeaux, de La Rochelle, et de Dunkerque ; c'est vrai, mais leur opinion est diamétralement opposée à celle que leur prête le Chef de Bureau des Instructions Nautiques ; elles réclament la création de ces Tribunaux Internationaux.

Dans cette longue liste, nous citerons seulement la délibération de la Chambre de Commerce de Nantes ; elle a une importance particulière. Le 16 Octobre, 1886, le Président du cette Chambre M. Rivron, écrivait :—

"J'ai l'honneur de vous faire connaître, Monsieur, que la Chambre de Commerce de Nantes n'hésite pas à donner son approbation à l'idée, par vous émise, en faveur de la création de Tribunaux Maritimes Internationaux chargés de prononcer sur les conflits qui se produisent entre navires de nationalités différentes. Nous croyons, comme vous, que l'institution de ces Tribunaux rendrait de grands services au commerce ; elle offrirait, en un mot, si elle était composée d'après les vues dont vous vous êtes inspiré, toutes garanties d'impartialité et de prompte justice. Elle mettrait fin aux difficultés qui naissent aujourd'hui des questions de compétence dont la solution entraîne souvent des délais excessifs, et elle aurait aussi pour résultat d'assurer l'exécution des Jugements.

"La réunion d'une Commission Internationale proposée par vous, dans le but d'élaborer une révision de la loi, serait d'une utilité évidente ; elle serait la préface obligée des Tribunaux Internationaux."

Faisons remarquer que plusieurs Sociétés de Géographie Commerciale et que plusieurs assemblées municipales ont pris des délibérations identiques. Le Congrès de Nantes (Août 1886) où quarante-deux Sociétés Géographiques se trouvaient représentées, a approuvé à l'unanimité la création de Tribunaux Maritimes Internationaux.

Le Conseil de l'Amirauté (séance du 24 Avril, 1886) a émis à l'unanimité le vœu suivant :—

"Qu'il serait du plus sérieux intérêt qu'un accord pût être réalisé entre les diverses nations maritimes pour la constitution des Tribunaux Internationaux chargés de connaître des litiges entre navires de nationalités différentes, et de les juger d'après une loi commune."

Le Gouvernement de Grèce, les Congrès de Hambourg et d'Anvers ont exprimé des avis pareils.

Le Gouvernement des États-Unis disait, le 4 Février, 1885, en parlant du Rapport sur cette question de M. Jarvis Patten, Commissaire de la Navigation : "Le Département de la Trésorerie donne pleinement son assentiment à ces idées." Or, le dit Rapport contient ces lignes dans son dernier paragraphe : "Il est probable que toutes les nations favoriseraient l'insertion de la deuxième clause proposée par M. Riondel dans les Règlements Internationaux, et j'incline à recommander son adoption."

En terminant cet exposé nous poserons devant le monde maritime, à M. le Chef du Bureau des Instructions Nautiques, les questions suivantes :—

1. Pourquoi n'a-t-il pas fait connaître tous les documents publiés de cette grande enquête Française ?

2. Pourquoi dit-il, en présence de ce dossier, qu'il connaissait parfaitement : "C'est compliquer le problème déjà si délicat de la sécurité sur mer, que de vouloir y joindre ces irréalisables propositions de Tribunaux Internationaux," (p. 108) ?

3. Que croit-il que pensera la Marine du passage final (p. 169) : "Nous avons cru rendre service aux navigateurs en mettant sous leurs yeux tous les éléments de discussion jusqu'ici épars dans les diverses publications Françaises et étrangères."

L'auteur des collisions en mer doit à l'opinion publique il se doit à lui-même de répondre à ces questions comment fera-t-il ?

L'Imprimerie Nationale, qui a prêté ses presses aux deux premières parties de son travail, pourra aisément publier la troisième.

Tarif Protecteur des Existences et Responsibilité des Compagnies.

La "Revue de la Marine Marchande," qui partage les idées de M. le Chef du Service des Instructions Nautiques au sujet des routes de navigation, émet une nouvelle objection contre ces routes :—

"Tout en admirant sincèrement les sentiments généreux qui inspirent les partisans des routes de navigation, dit-elle, nous ne pourrons partager leurs convictions que lorsqu'ils nous auront démontré que les capitaines des paquebots transatlantiques Français, Anglais et autres sont de leur opinion."

Ces partisans des routes, on le sait, ce sont: Les Chambres de Commerce, les Sociétés de Géographie Commerciale, les Municipalités des ports et environ 7,000 marins, parmi lesquels les plus éminents. Le dossier qui le constate embarrasse les ennemis des routes, aussi n'en parlent-ils jamais; mais ils ne se bornent pas à cette démonstration passive.

Au mois de Juin 1885, la Commission des Pétitions de la Chambre des Députés, sur la proposition de son Rapporteur, M. le Marquis de la Ferronnays, votait et signait un Rapport très favorable aux vœux des nombreux marins de tous rangs, armateurs, commerçants, Chambres de Commerce, Sociétés de Géographie et Municipalités des Ports; on y demandait en premier lieu la double route d'aller et de retour pour les paquebots. Le Rapport en démontrait éloquemment la nécessité.

Immédiatement informées, les grandes Compagnies de Navigation se mirent en campagne; quelques officiers de marine s'associèrent à ce mouvement.*

On entreprit de faire revenir sur leur vote les membres de la Commission; ce but ne fut pas atteint; le Rapport, fort heureusement, avait été remis à la questure, et il était trop tard pour revenir sur ce qui était fait.

Les Compagnies de Navigation sont dans leur rôle, quand elles s'opposent de toutes leurs forces à ce qu'on leur impose les nouvelles responsabilités qu'elles encourraient avec des itinéraires obligatoires; elles préfèrent garder leur liberté. Des routes internationales garantiraient sans doute la vie de leurs victimes, mais elles gêneraient leurs mouvements.

N'est-il pas évident d'autre part que l'opinion des Compagnies commande celles de leurs capitaines? Ceux-ci ont d'ailleurs cent raisons pour préférer une situation qui leur permet de suivre l'itinéraire qui leur convient davantage.

Cependant si, depuis deux ans, le passage du banc de Terre-Neuve avait été interdit aux paquebots, Granville compterait cinq navires de plus dans sa flotte; ses familles de marins ne seraient pas en deuil, on n'aurait pas les veuves et les orphelins des équipages du "Georges-et-Jeanne," du "Saint-Père," du "Medellin," &c., coulés par les paquebots sur les lieux de pêche.

Toute réglementation civile ou maritime entrave le libre arbitre; elle crée des responsabilités et une gêne; on ne saurait s'étonner qu'elles ne soient pas goûtées par certains capitaines; mais les doubles voies ne sont pas proposées pour l'agrément des Compagnies et de leurs officiers, mais bien pour la protection des personnes et des biens.

Si les Compagnies réclament leurs aises et s'élèvent contre toute atteinte à ce libre arbitre, c'est qu'elles veulent décliner toute responsabilité et que ce qui les touche avant tout, c'est de ne pas perdre une heure. de ne pas brûler une tonne de charbon en trop, et que, par suite, le parcours le plus court leur paraît le plus favorable; quant aux victimes, elles passent après ces considérations; d'ailleurs, on compte sur la Providence et sur sa bonne étoile.

Les Compagnies sont puissantes, leur influence est considérable; leur opposition constitue donc une barrière difficile à renverser. Mais l'accumulation incessante des sinistres maritimes aura raison de leur résistance et conduira fatalement à l'établissement de routes internationales.

L'auteur de l'article de la "Revue de la Marine Marchande" parle de "Pilot Charts" (Cartes dressées chaque mois par les États-Unis pour les navigateurs de l'Atlantique), et apporte ainsi un argument à notre cause. "Jadis on se contenait d'y indiquer la meilleure route pour éviter les glaces flottantes. Depuis plusieurs mois, ces mêmes Cartes indiquent une route d'aller et une route de retour pour les navires; de là, à réglementer ces tracés et à les rendre obligatoires, il n'y a qu'un pas; il suffit de vouloir le faire."

L'auteur ajoute:—

"La publication de ces Cartes est appelée à rendre de grands services aux navigateurs de l'Atlantique du Nord. Nous savons que ceux-ci tiennent toujours compte de leurs indications, mais elles empêcheront jamais les capitaines, soucieux d'arriver vite, de chercher à raccourcir leur route chaque fois que le temps clair leur permettra de ne pas craindre de passer dans des parages où des 'icebergs' ont été signalés par les 'Pilot Charts.'"

Cette appréciation n'est pas exacte, nous en sommes convaincus. Les capitaines suivront l'itinéraire devenu obligatoire si on met un prix assez élevé à chaque vie humaine anéantie dans un abordage causé par leur désobéissance à la loi, si on tarife, non seulement la mort, mais les blessures graves et les blessures légères aussi. Une pareille classification, facile à établir, est juste; on doit la faire, fixer un tarif élevé et faire accepter ces mesures dans un accord international. La responsabilité des capitaines n'existe pas aujourd'hui, elle fait défaut à la sécurité des mers; on doit l'établir. Elle sera certainement créée un jour, parce qu'il est équitable, quand on fait des veuves et des orphelins par sa faute en violant les lois, de prendre la charge de ces infortunés et de payer au poids de l'or ceux qu'on leur a enlevés.

Les Pétitions. qui ont marqué le premier mouvement de l'opinion publique sur cette question sont couvertes de signatures de capitaines au long cours, de capitaines au cabotage, de pilotes, de marins; des capitaines étrangers ont tenu à apporter aussi leur adhésion. Tous, comme les hautes Corporations citées ci-dessus, ont demandé le tracé de routes obligatoires, et c'est ce que constate le Rapport de M. de la Ferronnays. En outre, nos illustrations maritimes se sont aussi déclarées en faveur des routes maritimes.

C'est contre cette majorité que luttent les grandes Compagnies de Navigation, et, jusqu'à présent, elles ont été assez puissantes pour la tenir en échec. Leur influence, leur action sur les sphères officielles, leur ont donné cet avantage; mais il ne sera que passager: elles seront vaincues par la force prépondérante de l'opinion publique, de mieux en mieux éclairée.

---

* Lettre de M. de la Ferronnays au Président de la Société de Géographie de Rochefort.

Conclusions.

Le Rapport du Commissaire de la Navigation aux États-Unis.

M. Jarvis Patten démontre, dans son Rapport du 31 Janvier, 1885, la nécessité de recourir à des Tribunaux Internationaux :—

"L'établissement de ces Tribunaux," dit-il, "épargnerait des frais, préviendrait beaucoup d'ennuis, et conduirait à une plus grande harmonie dans l'interprétation donnée aux Lois sur les collisions par les différentes nations.

"Il est probable," ajoute-t-il, "que toutes les nations favoriseraient l'incorporation dans le nouveau Règlement International d'une clause semblable à celle que propose le Capitaine Riondel pour les Tribunaux Mixtes."

Dans le cours de ce Rapport le Commissaire de la Navigation condamne en ces termes les Tribunaux des Nationalités :—

"On peut dire que la question de juridiction, dans les cas dont il s'agit, est complètement incertaine chez les nations maritimes. Il en est résulté quelquefois beaucoup de désagréments, de part et d'autre, avec des frais et des ennuis considérables."

Presque toutes les Chambres de Commerce Maritimes de France ont fait entendre le même langage, leurs Résolutions offrent également ce double caractère: elles condamnent ce qui existe. Toutes réclament des Tribunaux Internationaux. La lecture attentive de ces Résolutions est donc très instructive.

En nous appuyant sur les autorités que nous venons de nommer, nous demandons l'établissement de Tribunaux Maritimes Internationaux, qui remplaceraient les Tribunaux des Nationalités.

Nous avons exprimé nos préférences dans la note lue au Congrès de Nantes. Ces vues ont obtenu l'approbation du Gouvernement des États-Unis et des Chambres de Commerce Françaises.

La Chambre de Nantes se prononçait ainsi dans son passage principal :—

"Si ces Tribunaux étaient composés d'après les vues dont vous vous êtes inspiré, ils offriraient toutes garanties d'impartialité et de prompte justice ; ils mettraient fin aux difficultés qui naissent aujourd'hui des questions de compétence dont la solution entraîne souvent des délais excessifs ; l'institution de ces Tribunaux aurait aussi pour résultat d'assurer l'exécution des Jugements."

Malgré cela, nous formulons simplement, d'une manière générale, dans notre conclusion, la nécessité d'une législation internationale. Nous resterons ainsi dans notre rôle d'officier de marine. Nos travaux peuvent servir, mais les jurisconsultes de droit maritime ont seuls la compétence et les connaissances requises pour résoudre les difficultés pratiques de cette organisation judiciaire. Nous considérons notre tâche comme remplie, après avoir saisi l'opinion publique et réussi à faire partager notre conviction par les plus hautes autorités. Nous avons eu la bonne fortune de voir un homme éminent prendre pied dans la question.

D'autres jurisconsultes marcheront sur ces traces et résoudront un problème dont tout le monde aujourd'hui reconnaît la grande importance. Comment serait-il irréalisable, quand les États-Unis, d'une part, et les Comités Commerciales et Maritimes de notre pays, d'autre part, pensent précisément, le contraire ?

L'organisation nouvelle rendra surtout des services si ses rouages sont simples et la justice expéditive. C'est à notre avis un point essentiel ; gagner du temps en marine est une qualité à laquelle il faut sacrifier beaucoup. C'est le vrai moyen de garantir les intérêts du commerce. Cette idée a inspiré la note que nous avons présentée au Congrès de Nantes. Elle a certainement entraîné l'adhésion donnée à notre projet par la Chambre de Commerce de Nantes et les autres Corporations Commerciales.

Dans tous les Jugements d'abordage, on ne considère généralement que les pertes matérielles. Le navire déclaré responsable de la collision est condamné à une juste réparation envers l'armateur lésé dans ses intérêts. Mais ce dommage se compose de deux éléments. L'un—le principal—est toujours laissé dans l'oubli. La vie humaine, sacrifiée ou mutilée, a droit cependant à une réparation, au même titre que le propriétaire du navire coulé à fond, ou varié par la faute du capitaine auteur du sinistre. Le Tribunal qui ordonne et fixe le dommage, après avoir pesé et jugé les circonstances de la cause, a le devoir de faire deux parts : celle des intérêts matériels et aussi celle des victimes. Tout être humain, en pareil cas, est égal devant la mort. La vie du simple matelot a droit à une indemnité égale à celle de toute autre personne qui périt dans le désastre. Ne devrait-il pas exister un Tarif International des indemnités accordées aux victimes, pour blessures légères, blessures graves, et perte de la vie ?

Le Tribunal International classerait et appliquerait le dit Tarif. L'état récapitulatif de cette équitable et tardive réparation serait déduit du chiffre accordé aujourd'hui intégralement aux propriétaires de navires. Les intérêts matériels sont très respectables. L'intérêt du matelot tué ou blessé dans un abordage mérite une protection légale qui, de nos jours, lui fait absolument défaut. Sa situation lui interdit absolument le recours à la justice, ce que peut faire l'armateur ou la Compagnie de Navigation. Le législateur a par suite le devoir de rétablir l'équilibre du droit et de la justice.

Un litige d'abordage est d'une nature spéciale. Les deux intérêts—matériel et humanitaire—ne doivent pas être séparés. Ces considérations sont surtout nécessaires à l'époque actuelle. Dans la lutte insensée des vitesses sur mer et des rivalités commerciales ou postales, le respect de la vie humaine est placé à un rang tout à fait inférieur. Les grandes Compagnies n'ont aucune responsabilité. Au point de vue de la stricte justice, et aussi au point de vue humanitaire, nous demandons instamment qu'une responsabilité pécuniaire leur soit imposée pour chaque vie humaine qu'elles anéantissent avec une insouciance et une imprudence que nous qualifions de coupables. On accomplira ainsi un acte de justice. On diminuera notablement le nombre des collisions en mer.

Inclosure 16 in No. 143.

Department of State, International Marine Conference,
Washington, December 31, 1889.

Sir,

I HAVE the honour to inform you that the Conference, at a session held on the 30th December, 1889, upon motion of the First Delegate for France, passed the following Resolution :—

Resolved,—That a Final Act be printed showing for each division of the programme, and in the order of the divisions, the Resolutions adopted by the Conference.

This Act to be signed in the name of the Conference by the President and the Secretary.

In compliance with this Resolution I have the honour to transmit said Final Act.

Final Act.

The President of the United States of America, in pursuance of a special provision of Congress, having extended to the Governments of all maritime nations in diplomatic relations with his own an invitation to send Delegates to a Maritime Conference to meet in the city of Washington on the 16th October, 1889, to discuss, revise, and amend the Rules, Regulations, and practice concerning vessels at sea and navigation generally, this International Marine Conference assembled at the time and place designated, and, after careful and patient discussion and consideration of the entire programme, passes the following Resolutions upon the subjects contained under the various General Divisions :—

General Division I.

Marine Signals or other means of plainly indicating the Direction in which Vessels are moving in Fog, Mist, Falling Snow, and Thick Weather, and at Night.

Rules for the prevention of Collisions, and Rules of the Road.

1. Visibility, number, and position of lights to be carried by vessels.

   (*a.*) Steamers under way.
   (*b.*) Steamers towing.
   (*c.*) Vessels under way, but not under command, including steamers laying cable.
   (*d.*) Sailing-vessels under way.
   (*e.*) Sailing-vessels towing.
   (*f.*) Vessels at anchor.
   (*g.*) Pilot-vessels.
   (*h.*) Fishing-vessels.

2. Sound-signals ; their character, number, range, and position of instruments.

   (*a.*) For use in fog, mist, falling snow, and thick weather, as position signals.
      For steamers under way.
      For steamers towing.
      For sailing-vessels under way.
      For sailing-vessels towing.
         (These signals to show the approximate course steered if possible.)
      For vessels at anchor.
      For vessels under way, but not under command, including steamers laying cable.
   (*b.*) For use in all weathers as helm-signals only.
      For steamers meeting or crossing.
      For steamers overtaking.
      For steamers backing.
   (*c.*) Whether helm-signal shall be made compulsory or remain optional.

3. Steering and sailing rules.

(*a.*) Sailing-vessels meeting, crossing, overtaking, or being overtaken by each other.
(*b.*) Steamers meeting, crossing, overtaking, or being overtaken by each other.
(*c.*) Sailing-vessels meeting, crossing, overtaking, or being overtaken by steamers.
(*d.*) Steamers meeting, crossing, overtaking, or being overtaken by sailing-vessels.
(*e.*) Special Rules for channels and tide-ways, where no local Rules exist.
(*f.*) Conflict of international and local Rules.
(*g.*) Uniform system of commands to the helm.
(*h.*) Speed of vessels in thick weather.

Resolved,—That in the opinion of the Conference it is inexpedient to adopt course-indicating sound-signals in foggy or thick weather; inasmuch as among the other strong reasons presented by the Sound-Signal Committee, if such signals were used in crowded waters, danger would result from the uncertainty and confusion produced by a multiplicity of signals, and from the false security that would be created in the minds of mariners, and if vessels were navigated in dependence on such signals, when neither could see the other, there would be danger that the officer in charge might read the signal incorrectly, or, if he read it correctly, would interpret it wrongly.

Regulations for preventing Collisions at Sea.

Preliminary.

These Rules shall be followed by all vessels upon the high seas and in all waters connected therewith, navigable by sea-going vessels.

In the following Rules every steam-vessel which is under sail and not under steam is to be considered a sailing-vessel, and every vessel under steam, whether under sail or not, is to be considered a steam-vessel.

The word "steam-vessel" shall include any vessel propelled by machinery.

A vessel is "under way," within the meaning of these Rules, when she is not at anchor, or made fast to the shore, or aground.

Rules concerning Lights, &c.

The word "visible" in these Rules when applied to lights shall mean visible on a dark night with a clear atmosphere.

Article 1. The Rules concerning lights shall be complied with in all weathers from sunset to sunrise, and during such time no other lights which may be mistaken for the prescribed lights shall be exhibited.

Art. 2. A steam-vessel when under way shall carry—

(*a.*) On or in front of the foremast, or if a vessel without a foremast, then in the fore part of the vessel, at a height above the hull of not less than 20 feet, and if the breadth of the vessel exceeds 20 feet, then at a height above the hull not less than such breadth, so, however, that the light need not be carried at a greater height above the hull than 40 feet, a bright white light, so constructed as to show an unbroken light over an arc of the horizon of 20 points of the compass, so fixed as to throw the light 10 points on each side of the vessel, viz., from right ahead to 2 points abaft the beam on either side, and of such a character as to be visible at a distance of at least 5 miles.

(*b.*) On the starboard side a green light so constructed as to show an unbroken light over an arc of the horizon of 10 points of the compass, so fixed as to throw the light from right ahead to 2 points abaft the beam on the starboard side, and of such a character as to be visible at a distance of at least 2 miles.

(*c.*) On the port side a red light so constructed as to show an unbroken light over an arc of the horizon of 10 points of the compass, so fixed as to throw the light from right ahead to 2 points abaft the beam on the port side, and of such a character as to be visible at a distance of at least 2 miles.

(*d.*) The said green and red side-lights shall be fitted with inboard screens projecting at

least 3 feet forward from the light, so as to prevent these lights from being seen across the bow.

(*e.*) A steam-vessel when under way may carry an additional white light similar in construction to the light mentioned in subdivision (*a*). These two lights shall be so placed in line with the keel that one shall be at least 15 feet higher than the other, and in such a position with reference to each other that the lower light shall be forward of the upper one. The vertical distance between these lights shall be less than the horizontal distance.

Art. 3. A steam-vessel when towing another vessel shall, in addition to her side-lights, carry two bright white lights in a vertical line one over the other, not less than 6 feet apart, and when towing more than one vessel shall carry an additional bright white light 6 feet above or below such lights, if the length of the tow, measuring from the stern of the towing-vessel to the stern of the last vessel towed, exceeds 600 feet. Each of these lights shall be of the same construction and character, and shall be carried in the same position as the white light mentioned in Article 2 (*a*), excepting the additional light, which may be carried at a height of not less than 14 feet above the hull.

Such steam-vessel may carry a small white light abaft the funnel or aftermast for the vessel towed to steer by, but such light shall not be visible forward of the beam.

Art. 4.—(*a.*) A vessel which from any accident is not under command shall carry at the same height as the white light mentioned in Article 2 (*a*), where they can best be seen, and if a steam-vessel in lieu of that light, two red lights, in a vertical line one over the other, not less than 6 feet apart, and of such a character as to be visible all round the horizon at a distance of at least 2 miles; and shall by day carry in a vertical line one over the other, not less than 6 feet apart, where they can best be seen, two black balls or shapes, each 2 feet in diameter.

(*b.*) A vessel employed in laying or in picking up a telegraph cable shall carry in the same position as the white light mentioned in Article 2 (*a*), and if a steam-vessel in lieu of that light, three lights in a vertical line one over the other, not less than 6 feet apart. The highest and lowest of these lights shall be red, and the middle light shall be white, and they shall be of such a character as to be visible all round the horizon, at a distance of at least 2 miles. By day she shall carry in a vertical line one over the other, not less than 6 feet apart, where they can best be seen, three shapes not less than 2 feet in diameter, of which the highest and lowest shall be globular in shape and red in colour, and the middle one diamond in shape and white.

(*c.*) The vessels referred to in this Article, when not making way through the water, shall not carry the side-lights, but when making way shall carry them.

(*d.*) The lights and shapes required to be shown by this Article are to be taken by other vessels as signals that the vessel showing them is not under command, and cannot therefore get out of the way.

These signals are not signals of vessels in distress and requiring assistance. Such signals are contained in Article 31.

Art. 5. A sailing-vessel under way, and any vessel being towed, shall carry the same lights as are prescribed by Article 2 for a steam-vessel under way, with the exception of the white lights mentioned therein, which they shall never carry.

Art. 6. Whenever, as in the case of small vessels under way during bad weather, the green and red side-lights cannot be fixed, these lights shall be kept at hand, lighted and ready for use; and shall, on the approach of or to other vessels, be exhibited on their respective sides in sufficient time to prevent collision, in such manner as to make them most visible, and so that the green light shall not be seen on the port side nor the red light on the starboard side, nor if practicable more than 2 points abaft the beam on their respective sides.

To make the use of these portable lights more certain and easy, the lanterns containing them shall each be painted outside with the colour of the light they respectively contain, and shall be provided with proper screens.

Art. 7. Steam-vessels of less than 40, and vessels under oars or sails of less than 20 tons, gross tonnage, respectively, when under way, shall not be obliged to carry the lights mentioned in Article 2 (*a*), (*b*), and (*c*), but if they do not carry them they shall be provided with the following lights:—

1. Steam-vessels of less than 40 tons shall carry—

(*a.*) In the fore part of the vessel, or on or in front of the funnel, where it can best be seen, and at a height above the gunwale of not less than 9 feet, a bright white light constructed and fixed as prescribed in Article 2 (*a*), and of such a character as to be visible at a distance of at least 2 miles.

(*b.*) Green and red side-lights constructed and fixed as prescribed in Article 2 (*b*) and (*c*), and of such a character as to be visible at a distance of at least 1 mile, or a combined

lantern showing a green light and a red light from right ahead to 2 points abaft the beam on their respective sides. Such lantern shall be carried not less than 3 feet below the white light.

2. Small steam-boats, such as are carried by sea-going vessels, may carry the white light at a less height than 9 feet above the gunwale, but it shall be carried above the combined lantern mentioned in subdivision 1 (*b*).

3. Vessels under oars or sails, of less than 20 tons, shall have ready at hand a lantern with a green glass on one side and a red glass on the other, which, on the approach of or to other vessels, shall be exhibited in sufficient time to prevent collision, so that the green light shall not be seen on the port side, nor the red light on the starboard side.

The vessels referred to in this Article shall not be obliged to carry the lights prescribed by Article 4 (*a*), and Article 11, last paragraph.

Art. 8. Pilot-vessels when engaged on their station on pilotage duty shall not show the lights required for other vessels, but shall carry a white light at the masthead, visible all round the horizon, and shall also exhibit a flare-up light or flare-up lights at short intervals, which shall never exceed fifteen minutes.

On the near approach of or to other vessels they shall have their side-lights lighted, ready for use, and shall flash or show them at short intervals, to indicate the direction in which they are heading, but the green light shall not be shown on the port side, nor the red light on the starboard side.

A pilot-vessel of such a class as to be obliged to go alongside of a vessel to put a pilot on board may show the white light instead of carrying it at the masthead, and may, instead of the coloured lights above mentioned, have at hand ready for use a lantern with a green glass on the one side and a red glass on the other, to be used as prescribed above.

Pilot-vessels when not engaged on their station on pilotage duty shall carry lights similar to those of other vessels of their tonnage.

Art. 9. Fishing-vessels and fishing-boats when under way, and when not required by this Article to carry or show the lights therein named, shall carry or show the lights prescribed for vessels of their tonnage under way.

(*a*.) Vessels and boats when fishing with drift-nets shall exhibit two white lights from any part of the vessel where they can best be seen. Such lights shall be placed so that the vertical distance between them shall be not less than 6 feet and not more than 10 feet, and so that the horizontal distance between them, measured in a line with the keel, shall be not less than 5 feet and not more than 10 feet. The lower of these two lights shall be the more forward, and both of them shall be of such a character as to show all round the horizon, and to be visible at a distance of not less than 3 miles.

(*b*.) Vessels when engaged in trawling, by which is meant the dragging of an apparatus along the bottom of the sea—

1. If steam-vessels, shall carry in the same position as the white light mentioned in Article 2 (*a*) a tricoloured lantern so constructed and fixed as to show a white light from right ahead to 2 points on each bow, and a green light and a red light over an arc of the horizon from 2 points on either bow to 2 points abaft the beam on the starboard and port side respectively; and not less than 6 nor more than 12 feet below the tricoloured lantern, a white light in a lantern, so constructed as to show a clear, uniform, and unbroken light all round the horizon.

2. If sailing-vessels of 7 tons gross tonnage and upwards, shall carry a white light in a lantern, so constructed as to show a clear, uniform, and unbroken light all round the horizon, and shall also be provided with a sufficient supply of red pyrotechnic lights, which shall each burn for at least thirty seconds, and shall be shown on the approach of or to other vessels in sufficient time to prevent collision.

In the Mediterranean Sea, the vessels referred to in subdivision (*b*) 2 may use a flare-up light in lieu of a pyrotechnic light.

All lights mentioned in subdivision *b* (1) and (2) shall be visible at a distance of at least 2 miles.

3. If sailing-vessels of less than 7 tons gross tonnage, shall not be obliged to carry the white light mentioned in subdivision *b* (2) of this Article, but if they do not carry such light, they shall have at hand, ready for use, a lantern showing a bright white light, which shall, on the approach of or to other vessels, be exhibited where it can best be seen, in sufficient time to prevent collision; and they shall also show a red pyrotechnic light, as prescribed in subdivision *b* (2), or in lieu thereof a flare-up light.

(*c*.) Vessels and boats when line-fishing with their lines out and attached to their lines, and when not at anchor or stationary, shall carry the same lights as vessels fishing with drift-nets.

(*d.*) Fishing-vessels and fishing-boats may at any time use a flare-up light in addition to the lights which they are by this Article required to carry and show. All flare-up lights exhibited by a vessel when trawling or fishing with any kind of drag-net shall be shown at the after part of the vessel, excepting that, if the vessel is hanging by the stern to her fishing gear, they shall be exhibited from the bow.

(*e.*) Every fishing-vessel and every boat when at anchor shall exhibit a white light visible all round the horizon at a distance of at least 1 mile.

(*f.*) If a vessel or boat when fishing becomes stationary in consequence of her gear getting fast to a rock or other obstruction, she shall show the light and make the fog-signal prescribed for a vessel at anchor, respectively. (See Article 15 (*d*), (*e*), and last paragraph.)

(*g.*) In fog, mist, falling snow, or heavy rain-storms, drift-net vessels attached to their nets, and vessels when trawling, dredging, or fishing with any kind of drag-net, and vessels line-fishing with their lines out, shall, if of 20 tons gross tonnage or upwards, respectively, at intervals of not more than one minute, make a blast; if steam-vessels with the whistle or siren, and if sailing-vessels with the fog-horn, each blast to be followed by ringing the bell.

(*h.*) Sailing-vessels or boats fishing with nets or lines or trawls, when under way, shall in daytime indicate their occupation to an approaching vessel by displaying a basket or other efficient signal, where it can best be seen.

The vessels referred to in this Article shall not be obliged to carry the lights prescribed by Article 4 (*a*), and Article 11, last paragraph.

Art. 10. A vessel which is being overtaken by another shall show from her stern to such last-mentioned vessel a white light or a flare-up light.

The white light required to be shown by this Article may be fixed and carried in a lantern, but in such case the lantern shall be so constructed, fitted, and screened that it shall throw an unbroken light over an arc of the horizon of 12 points of the compass, viz., for 6 points from right aft on each side of the vessel, so as to be visible at a distance of at least 1 mile. Such light shall be carried as nearly as practicable on the same level as the side-lights.

Art. 11. A vessel under 150 feet in length, when at anchor, shall carry forward, where it can best be seen, but at a height not exceeding 20 feet above the hull, a white light in a lantern, so constructed as to show a clear, uniform, and unbroken light visible all round the horizon at a distance of at least 1 mile.

A vessel of 150 feet or upwards in length, when at anchor, shall carry in the forward part of the vessel, at a height of not less than 20 and not exceeding 40 feet above the hull, one such light, and at or near the stern of the vessel, and at such a height that it shall be not less than 15 feet lower than the forward light, another such light.

The length of a vessel shall be deemed to be the length appearing in her certificate of registry.

A vessel aground in or near a fairway shall carry the above light or lights and the two red lights prescribed by Article 4 (*a*).

Art. 12. Every vessel may, if necessary in order to attract attention, in addition to the lights which she is by these Rules required to carry, show a flare-up light or use any detonating signal that cannot be mistaken for a distress signal.

Art. 13. Nothing in these Rules shall interfere with the operation of any special Rules, made by the Government of any nation, with respect to additional station and signal-lights for two or more ships of war or for vessels sailing under convoy, or with the exhibition of recognition signals adopted by ship-owners, which have been authorized by their respective Governments and duly registered and published.

Art. 14. A steam-vessel proceeding under sail only, but having her funnel up, shall carry in daytime, forward, where it can best be seen, one black ball or shape 2 feet in diameter.

Sound-Signals for Fog, &c.

Art. 15. All signals prescribed by this Article for vessels under way shall be given—

1. By "steam-vessels" on the whistle or siren.
2. By "sailing-vessels and vessels towed" on the fog-horn.

The words "prolonged blast" used in this Article shall mean a blast of from four to six seconds' duration.

A steam-vessel shall be provided with an efficient whistle or siren, sounded by steam or some substitute for steam, so placed that the sound may not be intercepted by any

obstruction, and with an efficient fog-horn, to be sounded by mechanical means, and also with an efficient bell.* A sailing-vessel of 20 tons gross tonnage or upwards shall be provided with a similar fog-horn and bell.

In fog, mist, falling snow, or heavy rain-storms, whether by day or night, the signals described in this Article shall be used as follows, viz. :—

(*a.*) A steam-vessel having way upon her shall sound, at intervals of not more than two minutes, a prolonged blast.

(*b.*) A steam-vessel under way, but stopped and having no way upon her, shall sound, at intervals of not more than two minutes, two prolonged blasts, with an interval of about one second between them.

(*c.*) A sailing-vesel under way shall sound, at intervals of not more than one minute, when on the starboard tack one blast, when on the port tack two blasts in succession, and when with the wind abaft the beam three blasts in succession.

(*d.*) A vessel when at anchor shall, at intervals of not more than one minute, ring the bell rapidly for about five seconds.

(*e.*) A vessel, at anchor at sea, when not in ordinary anchorage ground and when in such a position as to be an obstruction to vessels under way, shall sound, if a steam-vessel, at intervals of not more than two minutes, two prolonged blasts with her whistle or siren, followed by ringing her bell; or, if a sailing-vessel, at intervals of not more than one minute, two blasts with her fog-horn, followed by ringing her bell.

(*f.*) A vessel, when towing, shall, instead of the signals prescribed in subdivisions (*a*) and (*c*) of this Article, at intervals of not more than two minutes, sound three blasts in succession, viz., one prolonged blast followed by two short blasts. A vessel towed may give this signal, and she shall not give any other.

(*g.*) A steam-vessel wishing to indicate to another "The way is off my vessel, you may feel your way past me," may sound three blasts in succession, viz., short, long, short, with intervals of about one second between them.

(*h.*) A vessel employed in laying or in picking up a telegraph cable shall, on hearing the fog-signal of an approaching vessel, sound in answer three prolonged blasts in succession.

(*i.*) A vessel under way, which is unable to get out of the way of an approaching vessel through being not under command, or unable to manœuvre as required by these Rules, shall, on hearing the fog-signal of an approaching vessel, sound in answer four short blasts in succession.

Sailing-vessels and boats of less than 20 tons gross tonnage shall not be obliged to give the above-mentioned signals, but if they do not, they shall make some other efficient sound-signal at intervals of not more than one minute.

Speed of Ships to be Moderate in Fog, &c.

Art. 16. Every vessel shall, in a fog, mist, falling snow, or heavy rain-storms, go at a moderate speed, having careful regard to the existing circumstances and conditions.

A steam-vessel hearing, apparently forward of her beam, the fog-signal of a vessel the position of which is not ascertained, shall, so far as the circumstances of the case admit, stop her engines, and then navigate with caution until danger of collision is over.

Steering and Sailing Rules.

Preliminary.—Risk of Collision.

Risk of collision can, when circumstances permit, be ascertained by carefully watching the compass bearing of an approaching vessel. If the bearing does not appreciably change, such risk should be deemed to exist.

Art. 17. When two sailing-vessels are approaching one another, so as to involve risk of collision, one of them shall keep out of the way of the other, as follows, viz. :—

(*a.*) A vessel which is running free shall keep out of the way of a vessel which is close-hauled.

* *Note.*—In all cases where the Rules require a bell to be used a drum may be substituted on board Turkish vessels, or a gong where such articles are used on board small sea-going vessels.

(*b.*) A vessel which is close-hauled on the port tack shall keep out of the way of a vessel which is close-hauled on the starboard tack.

(*c.*) When both are running free, with the wind on different sides, the vessel which has the wind on the port side shall keep out of the way of the other.

(*d.*) When both are running free, with the wind on the same side, the vessel which is to windward shall keep out of the way of the vessel which is to leeward.

(*e.*) A vessel which has the wind aft shall keep out of the way of the other vessel.

Art. 18. When two steam-vessels are meeting end on, or nearly end on, so as to involve risk of collision, each shall alter her course to starboard, so that each may pass on the port side of the other.

This Article only applies to cases where vessels are meeting end on, or nearly end on, in such a manner as to involve risk of collision, and does not apply to two vessels which must, if both keep on their respective courses, pass clear of each other.

The only cases to which it does apply are when each of the two vessels is end on, or nearly end on, to the other; in other words, to cases in which, by day, each vessel sees the masts of the other in a line, or nearly in a line, with her own; and by night, to cases in which each vessel is in such a position as to see both the side-lights of the other.

It does not apply, by day, to cases in which a vessel sees another ahead crossing her own course; or by night, to cases where the red light of one vessel is opposed to the red light of the other, or where the green light of one vessel is opposed to the green light of the other, or where a red light without a green light, or a green light without a red light, is seen ahead, or where both green and red lights are seen anywhere but ahead.

Art. 19. When two steam-vessels are crossing, so as to involve risk of collision, the vessel which has the other on her own starboard side shall keep out of the way of the other.

Art. 20. When a steam-vessel and a sailing-vessel are proceeding in such directions as to involve risk of collision, the steam-vessel shall keep out of the way of the sailing-vessel.

Art. 21. Where by any of these Rules one of two vessels is to keep out of the way, the other shall keep her course and speed.

Art. 22. Every vessel which is directed by these Rules to keep out of the way of another vessel shall, if the circumstances of the case admit, avoid crossing ahead of the other.

Art. 23. Every steam-vessel which is directed by these Rules to keep out of the way of another vessel shall, on approaching her, if necessary, slacken her speed or stop or reverse.

Art. 24. Notwithstanding anything contained in these Rules, every vessel overtaking any other shall keep out of the way of the overtaken vessel.

Every vessel coming up with another vessel from any direction more than 2 points abaft her beam, *i.e.*, in such a position, with reference to the vessel which she is overtaking that at night she would be unable to see either of that vessel's side-lights, shall be deemed to be an overtaking vessel; and no subsequent alteration of the bearing between the two vessels shall make the overtaking vessel a crossing vessel within the meaning of these Rules, or relieve her of the duty of keeping clear of the overtaken vessel until she is finally past and clear.

As by day the overtaking vessel cannot always know with certainty whether she is forward of or abaft this direction from the other vessel she should, if in doubt, assume that she is an overtaking vessel and keep out of the way.

Art. 25. In narrow channels every steam-vessel shall, when it is safe and practicable, keep to that side of the fairway or mid-channel which lies on the starboard side of such vessel.

Art. 26. Sailing-vessels under way shall keep out of the way of sailing-vessels or boats fishing with nets, or lines, or trawls. This Rule shall not give to any vessel or boat engaged in fishing the right of obstructing a fairway used by vessels other than fishing-vessels or boats.

Art. 27. In obeying and construing these Rules due regard shall be had to all dangers of navigation and collision, and to any special circumstances which may render a departure from the above Rules necessary in order to avoid immediate danger.

Sound-Signals for Vessels in sight of one another.

Art. 28. The words "short blast" used in this Article shall mean a blast of about one second's duration.

When vessels are in sight of one another, a steam-vessel under way, in taking any course authorized or required by these Rules, shall indicate that course by the following signals on her whistle or siren, viz. :—

One short blast to mean, "I am directing my course to starboard."

Two short blasts to mean, "I am directing my course to port."

Three short blasts to mean, "My engines are going full speed astern."

No Vessel, under any circumstances, to neglect proper Precautions.

Art. 29. Nothing in these Rules shall exonerate any vessel, or the owner, or master, or crew thereof, from the consequences of any neglect to carry lights or signals, or of any neglect to keep a proper look-out, or of the neglect of any precaution which may be required by the ordinary practice of seamen, or by the special circumstances of the case.

Reservation of Rules for Harbours and Inland Navigation.

Art. 30. Nothing in these Rules shall interfere with the operation of a special Rule, duly made by local authority, relative to the navigation of any harbour, river, or inland waters.

Distress Signals.

Art. 31. When a vessel is in distress and requires assistance from other vessels or from the shore, the following shall be the signals to be used or displayed by her, either together or separately, viz. :—

In the daytime—

1. A gun fired at intervals of about a minute;
2. The International Code signal of distress indicated by NC;
3. The distant signal, consisting of a square flag, having either above or below it a ball or anything a resembling a ball;
4. Rockets or shells as prescribed below for use at night;
5. A continuous sounding with any fog-signal apparatus.

At night—

1. A gun fired at intervals of about a minute;
2. Flames on the vessel (as from a burning tar-barrel, oil-barrel, &c.);
3. Rockets or shells, bursting in the air with a loud report and throwing stars of any colour or description, fired one at a time at short intervals;
4. A continuous sounding with any fog-signal apparatus.

The following Resolutions have been approved of by the Conference, and are recommended to the attention of the Powers represented thereat in an Appendix to Rules of the Road :—

1. The power of all lights should be expressed by referring them all to one standard, by which the light issuing from the lantern should be measured.
2. The minimum power only of each light should be definitely fixed, leaving it to the judgment of the parties responsible for fitting out the vessels with proper lanterns to employ lamps of this or greater power.
3. The use of incandescent lamps should be permitted; the use of arc lights, at present, should be excluded for all purposes other than signalling and searching.
4. Each lantern should be so constructed that the minimum power of light can be found at every point where the light is to be visible after the lamp has been fitted with proper screens.
5. The lanterns should be so constructed as to insure the light having, at least, the required minimum power in the ideal line connecting the lantern with the horizon, even though the vessel be heeled one way or the other 10 degrees.
6. The colour of the glasses by which the colouring of the light is to be produced should be so chosen that, if possible, the red light shall have no admixture of green, nor the green light of red rays, and that both colours can be readily and unmistakably distinguished.
7. No detailed description should be internationally adopted for the construction of the lamp or lantern, so that a fair chance may be given to inventors to produce serviceable articles.
8. The side-lights should be so screened as to prevent the most convergent rays of the light being seen across the bows more than half a point.

9. The side-lights should be placed, in steam-vessels, not forward of the masthead-light.

10. To meet the number of complaints as to the absence of proper lights on sailing-vessels, the attention of the Powers is called to the better enforcement of the Regulations in that behalf.

11. All steam-whistles, sirens, fog-horns, and bells should be thoroughly tested as to their efficiency, and should be capable of being heard at a stated minimum distance, and should be so regulated that the tones of whistles and sirens should be as distinct as possible from the sound of fog-horns.

12. Steam-vessels should be provided, if possible, with means of blowing off surplus steam when the engines are stopped, in such a manner as to occasion as little noise as possible.

13. In clear weather at sea no vessel should attempt to cross the bows of the leaders of any squadron of three or more ships of war in regular formation, nor unnecessarily to pass through the lines of such squadron.

14. In every case of collision between two vessels it should be the duty of the master or person in charge of each vessel, if and so far as he can do so without serious danger to his own vessel, crew, and passengers (if any), to stay by the other vessel until he has ascertained that she has no need of further assistance, and to render to the other vessel, her master, crew, and passengers (if any), such assistance as may be practicable and as may be necessary in order to save them from any danger caused by the collision, and also to give to the master or person in charge of the other vessel the name of his own vessel, and her port of registry, or the port or place to which she belongs, and also the name of the ports and places from which and to which she is bound.

General Division II.

Regulations to determine the Seaworthiness of Vessels.

(*a.*) Construction of vessels.
(*b.*) Equipment of vessels.
(*c.*) Discipline of crew.
(*d.*) Sufficiency of crew.
(*e.*) Inspection of vessels.
(*f.*) Uniform certificates of inspection.

1. It is the opinion of the Conference that, upon the subjects contained in the sections of this Division no International Rule could be made which would secure beneficial results. It is thought that the Conference would be limited in each case to a recommendation fixing a minimum for the objects which it is desired to secure under each of these sections. If such a minimum were made the legal requirement it would have an injurious effect upon the present standard of efficiency in many countries.

2. In other countries where such efficiency does not exist, it is thought that it will be best secured by the same means which have secured it elsewhere, leaving each nation to modify such means in ways which will best adapt them to the particular methods of the respective Governments.

3. Again, it is found that the present Rules existing in different countries upon several of these questions are different in many respects, though probably equally efficient. It would, therefore, become necessary, in forming an International Rule in such cases, to recommend changes in the existing Rules of several countries, which to some of them might be impracticable. This is thought to be undesirable. However, the Conference earnestly recommend that—

4. All vessels, whether propelled by steam or sail, should possess a margin of strength over and above that which is required to enable them to perform the work for which they were designed and built. A chain, a bridge, or any other structure, the failure of which would entail the loss of human life, invariably has a considerable reserve of strength provided; in other words, the admitted working load is always much less than the computed strength, or the strength ascertained by actual test; certainly, it is no less important that the hull of a vessel should contain a similar reserve.

5. To attempt to formulate Rules for the construction of vessels of all sizes and for all trades would far exceed the province of this Conference; and, besides, any

arbitrary Rules would probably much hamper the advance in design and the method of construction.

6. Therefore, to obtain as much as seems to be practicable in this direction, it is desirable to rely upon efficient and oft-repeated inspection, when, upon the least indication of distress or of rupture showing, very substantial additions should be made before the vessel is allowed to again proceed to sea.

7. Ocean-going steam-vessels which carry passengers should be additionally protected by having efficient bulkheads, so spaced that when any two compartments be filled with water, the vessels will still remain in a seaworthy condition, and two, at least, of the amidships bulkheads should be tested by water-pressure to the height of the deck next above the water-line.

General Division III.

Draft to which Vessels should be restricted when loaded.

"Uniform maximum load-mark."

The Conference are led to believe that notwithstanding the advantages which would be connected with the introduction of a uniform system of load-marks, this matter is not ripe for consideration by this Conference, and that it ought to be left to the negotiations to be carried on between the Governments of the maritime nations.

General Division IV.

Uniform Regulations regarding the Designating and Marking of Vessels.

(*a.*) Position of name on vessels.
(*b.*) Position of name of port of registry on vessels.
(*c.*) Size of lettering.
(*d.*) Uniform system of draught-marks.

1. The name of every registered merchant-vessel shall be marked upon each bow and upon the stern, and the port of registry of every such vessel shall be marked upon the stern.

These names shall be marked in Roman letters in a light colour on a dark ground, or in a dark colour on a light ground, and to be distinctly visible.

The smallest letters used shall not be less than 4 inches high.

2. The draught of every registered vessels hall be marked upon the stem and stern-post in English feet or decimeteres, in either Arabic or Roman numerals. The bottom of each numeral shall indicate the draft to that line.

General Division V.

Saving Life and Property from Shipwreck.

1. Saving of life and property from shipwreck at sea.
(*a.*) Duties of vessels after collision.
(*b.*) Apparatus for life saving to be carried on board ship. (Life-boats, life-preservers, life-rafts, pumps, and fire-extinguishing apparatus.)
(*c.*) The use of oil and the necessary apparatus for its use.
(*d.*) Uniform inspections as to (*b*) and (*c*).
2. Saving of life and property from shipwreck by operations from shore.
(*a.*) Organization of, and methods employed by, life-saving institutions.
(*b.*) The employment of drilled and disciplined crews at life-saving stations.
(*c.*) The maintenance of a patrol upon dangerous coasts by night, and during thick

weather by day, for warning off vessels standing into danger, and for the early discovery of wrecks.

(*d.*) Uniform means of transmitting information between stranded vessels and the shore.

(*e.*) Life-boats, life-saving apparatus and appliances.

3. Official inquiries into causes and circumstances of shipwrecks and other casualties.

(1.) *Resolved*,—In every case of collision between two vessels, it shall be the duty of the master or person in charge of each vessel, if and so far as he can do so without danger to his own vessel, crew, and passengers (if any), to stay by the other vessel until he has ascertained that she has no need of further assistance, and to render to the other vessel, her master, crew, and passengers (if any), such assistance as may be practicable, and as may be necessary in order to save them from any danger caused by the collision; and also to give to the master or person in charge of the other vessel the name of his own vessel, and of her port of registry, or of the port or place to which she belongs, and also the names of the ports and places from which and to which she is bound.

(2.) *Resolved*,—That the Conference approve of the principle of the Rules made by the Board of Trade of Great Britain under "The Merchant Shipping (Life-Saving Appliances) Act, 1888," relating to boats and appliances to be carried on board ship for saving life; and recommend that the several Governments adopt measures to secure compliance with this principle in regard to such boats and appliances for vessels of 150 tons and upwards gross tonnage.

It is also recommended that the principle of these Rules be extended to all smaller craft, as far as practicable; and that each vessel of this class should carry at least one life-buoy of approved pattern and material, and for every person on board an efficient life-belt or jacket.

(3.) *Resolved*,—That the Conference recommend that the several Governments require all their sea-going vessels to carry a sufficient quantity of animal or vegetable oil, for the purpose of calming the sea in rough weather, together with suitable means for applying it.

(4.) *Resolved*,—That the Conference recommend that all institutions for saving life from wrecked vessels prepare uniform instructions to mariners with reference to their co-operation with those attempting their rescue from the shore, and that said instructions include the following signals:—

Upon the discovery of a wreck by night the life-saving force will burn a red pyrotechnic light or a red rocket to signify "You are seen; assistance will be given as soon as possible."

A red flag waved on shore by day, or a red light, red rocket, or red Roman candle displayed by night will signify "Haul away."

A white flag waved on shore by day, or a white light slowly swung back and forth, or a white rocket or white Roman candle fired by night, will signify "Slack away."

Two flags, a white and a red, waved at the same time on shore by day, or two lights, a white and a red, slowly swung at the same time, or a blue pyrotechnic light burned by night, will signify "Do not attempt to land in your own boats. It is impossible."

A man on shore beckoning, by day, or two torches burning near together, by night, will signify "This is the best place to land."

Any of these signals may be answered from the vessel as follows: In the daytime by waving a flag, a handkerchief, a hat, or even the hand; at night by firing a rocket, a blue light or a gun, or by showing a light over the ship's gunwale for a short time and then concealing it.

And it is recommended that the several Governments take measures to keep all their sea-going vessels supplied with copies of such instructions.

6. *Resolved*,—That the Conference recommend that the several nations provide by legislative enactments for official inquiry into the causes and circumstances of all shipwrecks and other serious casualties happening to their vessels.

General Division VI.

Necessary Qualifications for Officers and Seamen, including Tests for Sight and Colour Blindness.

(*a.*) A uniform system of examination for the different grades.
(*b.*) Uniform tests for visual power and colour-blindness.
(*c.*) General knowledge of methods employed at life-saving stations.
(*d.*) Uniform certificates of qualification.

1. Every man or boy going to sea as a seaman, or with the intention of becoming a seaman, should be examined for visual power and colour-blindness; and no man or boy should be permitted to serve on board any vessel in the capacity of seaman, or where he will have to stand look-out, whose visual power is below one-half normal, or who is red and green colour-blind.

2. Every man who shall qualify as an officer or as a pilot of a registered vessel after the adoption of these Rules, except engineer officers, shall be required to have a certificate that he has the necessary visual power, and that he is not red and green blind. He shall also have a certificate that he is familiar with the Regulations for preventing collisions at sea, and with the duties required of him in co-operating with a life-saving station in case his vessel is stranded.

3. It is recommended that each country provide means which will enable any boy or man intending to go to sea to have his eyes examined for visual power and colour-blindness, and to obtain a certificate of the result, also to enable the master of any vessel to have the eyes of any of his crew tested for the same purpose.

It is the opinion of the Conference that defective visual power and colour-blindness are sources of danger at sea. The first both by day and night, because of the inability of the short-sighted to see objects at a sufficient distance. Colour-blindness is a source of danger, more especially at night, because of the inability of a colour-blind person to distinguish between the red and green side-lights. The inability on the part of an officer or look-out to distinguish the colour of buoys may be a cause of accident in broad daylight.

It is the opinion of the Conference, however, that tests for these defects need not be enforced in the cases of masters and mates who already occcupy such positions.

The Conference purposely avoid making any recommendation as to the methods to be used in making such tests for visual power and colour-blindness, or in conducting the necessary examinations for officers. It is thought that the desired objects will be best secured by leaving each country to employ the methods which may seem most suitable.

General Division VII.

Lanes for Steamers on frequented Routes.

(*a.*) With regard to the avoidance of steamer collisions.
(*b.*) With regard to the safety of fishermen.

After consideration of various routes the Conference concluded to report only upon the North Atlantic route between ports of North America and ports of Northern Europe as the route upon which there was apparently the greater demand for such lanes, if such could be advantageously laid down on any ocean or sea.

It appears that the adherence of fast steam passenger-vessels to certain southerly routes would tend to the avoidance of fog and ice, and the Conference adopted a Resolution to the effect that it was desirable during the spring and summer months that such vessels should follow a southern route which would clear the Banks of Newfoundland, and be likely to be clear of fog and ice, but when it came to proposing any plan to make such ocean lanes compulsory, the Conference found the subject one of such difficulty that they do not recommend a proposition of that nature.

The difficulty of enforcing the present Rule providing for moderate speed in thick weather suggests what greater difficulties would be met with in enforcing lane routes if made compulsory, and it was not thought desirable to lay down routes by international agreement unless they were to be made compulsory for swift steamers.

Routes that might be proposed would be in danger of invasion by ice during the spring and summer months, and at all times would be crossed by sailing-vessels and

steamers going north and south. If laid down on parallels of latitude which seemed to favour one seaport at the expense of another, or the ports of one country at the expense of the ports of another country, they would arouse opposition that would probably prevent their adoption.

It is possible that even in the near future vessels may be employed of such power and speed that all such considerations may have to give way to the paramount consideration of safety, but, so far as shown to the Conference, present conditions do not seem to justify an international agreement to that effect. It was not shown to the Conference that collisions in mid-ocean between fast ocean steamers had taken place, or that the danger was great enough to justify enforced adherence to certain lanes. Collisions between fast steam-ships, so far, have occurred nearer the coasts where all tracks must converge.

The Conference believe, however, that the voluntary establishment of, and adherence to, particular routes by the different Steam-ship Companies, for different seasons of the year, is very desirable. In fact, the Conference are of the opinion that such action by the Steam-ship Companies, with the experience to be gained thereby, would be quite essential before any concerted action by the Maritime Powers could be profitably taken.

The Conference therefore strongly recommend that the Companies interested should, by mutual agreement, after consultation together, establish routes for the different lines, and make them public, in order that the Hydrographic Offices of the various Governments may publish them for the information of navigators.

The Conference have considered the opinions of several persons in the printed matter that has been laid before them. With the exception of one or two definite propositions, the literature before the Conference does not show how such lane routes could be laid down. Even those containing such propositions arrive at the conclusion that such routes could not be made compulsory.

With regard to the safety of fishermen upon the North Atlantic Ocean, the Conference are of opinion that their safety would be best promoted by unceasing vigilance on the part of the fishermen, and by careful compliance by all with the present Rules for the prevention of collisions, especially as to the efficiency of lights and sound-signals. If lanes were established which carried the fast steamers clear of the Banks frequented by the fishermen it might promote such a sense of security on their part as would tend to carelessness with reference to the Rules as at present laid down, and lead to danger from the slower vessels which would still frequent the Banks.

During the months when the fishing-vessels most frequent the Banks the fear of encountering fog and ice leads many of the steamers to go south of them.

Quick passages are what the steam-vessels aim at in response to the public demand for swift passenger and mail service, and if they were compelled to obey existing Rules regarding moderate speed in fogs at all times and in all places they would avoid the Banks still more in order to go clear of fogs; and thus it seems that the solution of the problem before the Conference, namely, of how to induce steam-ships of great speed to take safer routes to avoid fogs, ice, and danger of collision with fishermen and other vessels, is in compelling obedience to the present Rules regarding moderate speed in thick weather. The enforcement of these Rules would make it for the interest of such vessels to take routes comparatively clear of fogs and ice, and thus attain the end which compulsory legislation might fail to do.

From the correspondence placed before the Conference regarding the dangers of fishermen upon the Banks, it will be observed that vigilance regarding lights and sound-signals have been found efficient safeguards in most instances.

General Division VIII.

Night Signals for communicating Information at Sea.

(*a.*) A Code to be used in connection with the International Code Signal Book.

(*b.*) Or a Supplementary Code of limited scope to convey information of special importance to passing vessels.

(*c.*) Distress signals.

With regard to subsections (*a*) and (*b*) of General Division VIII, the Conference have considered systems of night-signals with ordinary coloured lights, but the objection exists that they cannot be seen so far as a white light. It is the opinion of the Conference

that night-signalling at sea can better be carried on by a system of long and short flashes from a white light than by any system in which coloured lights are used.

The Conference have concluded that the systems of signalling by pyrotechnic lights which have been brought to their notice are too expensive for general use.

The Conference have had before them "a Supplementary Code of limited scope to convey information of special importance to passing vessels," which has been prepared by a Committee of the British Board of Trade, and has been presented by the British Government to the various Powers for their consideration.

The Conference, after careful consideration, recommend the adoption, for optional use, of that Supplementary Code, with the following change: To strike out signal PG, "Beware of derelict dangerous to navigation," and substitute in its place NP, "I want assistance. Remain by me."

The Conference decided upon the following fog-signals, to be allotted to pilots and to vessels seeking pilots:—

For vessels requiring pilots—a prolonged blast followed by a short blast, — —.

For pilots wishing to offer their services—short blast followed by a long blast, — —.

And the Conference recommend that they be inserted in the International Code Book under the Pilot-Signals.

The Conference suggest that the complete alphabet of the Morse Code be inserted in the International Code Book for optional use.

General Division IX.

Warnings of approaching Storms.

(*a.*) The transmission of warnings.
(*b.*) The uniformity of signals employed.

The preparation of weather forecasts and the transmission of warnings regarding expected storms must, by the very nature of the subject, be dealt with locally; and it is in the opinion of the Conference very questionable whether any useful purpose would be gained by the adoption of uniformity of methods, except so far as the general progress of scientific knowledge indicates the direction of possible improvement; and this, it is hardly necessary to say, is more likely to be secured by work carried on independently rather than under any uniform system.

The Conference invite the maritime countries interested to take into consideration the establishment of a uniform system of indicating storm warnings by day and by night, and that such a system should, as far as possible, include signals indicating whether the storm is approaching or has passed the station.

General Division X.

Reporting, marking, and removing Dangerous Wrecks or Obstructions to Navigation.

(*a.*) A uniform method of reporting and marking dangerous wrecks and derelicts.

(*b.*) The division of the labour, cost, and responsiblity among the several maritime nations, either by geographical apportionment or otherwise:—

Of the removal of dangerous derelicts;

And of searching for doubtful dangers with a view of removing them from the charts.

Resolutions submitted for the consideration of the Powers.

1. That it is advisable to make it the duty of any of the officers or of the crew of a wreck or derelict to report, as soon as possible after landing, to the nearest harbour authority, if necessary through their Consul, as follows:—

(*a.*) Name of the vessel abandoned.
(*b.*) Her distinguishing number.

(*c.*) Name of her home port, port from which she sailed, and place of destination.

(*d.*) General description of vessel and her rig.

(*e.*) Place where abandoned (latitude and longitude as near as possible).

(*f.*) Weather and current experienced before leaving the vessel, and in case she was a derelict, the direction in which she would most likely drift.

(*g.*) Whether or not it is intended to take any steps toward her recovery.

2. That a similar report should be made to the same authorities by the master of any vessel sighting a wreck or derelict, and a suitable entry made in the ship's log.

3. That such reports should be published in "Notices to Mariners," the daily press, and, if necessary, by giving telegraphic information to the ports which it most concerns.

4. That it is advisable to make it the duty of every commander or master of a vessel o report the fact that an iceberg or dangerous field ice has been sighted, or a shoal, reef, or other obstruction has been discovered, to the harbour authorities or the Hydrographic Office of that country to which the port next reached belongs, giving a full description of the obstruction, and all facts that may lead to the determination of its position; for instance, the time elapsed since the last reliable astronomical observation, and the rate of the chronometer. If the obstruction be a shoal or reef, the depth of water actually obtained by sounding on it should be given. Also, when land is in sight, the position of any off-lying shoal or reef should be determined by compass bearings of fixed objects in view; the error of the compass being stated, with information as to how and when that error was observed. Angles should also be taken between such objects, and a drawing of the coast and the position of the observer be added.

5. That whenever practicable it shall be the duty of the crew before abandoning a vessel (*a*) to hoist some distinctive signal, as: BCF, "Abandoned by the crew," or CRTG, "Derelict," or a ball, shape, or other similar mark, where it can best be seen, and where it should not be mistaken for any other authorized signal; (*b*) to let go the sheets and halliards of such sails as are not furled.

6. That the different Maritime Powers interested in the navigation of that portion of the North Atlantic Ocean bordering the American coast, and situated westward of a line drawn from the Bermuda Islands to Cape Race, Newfoundland, be invited to come to an agreement respecting the removal of derelicts in these waters under due official supervision.

7. That in countries which, by Treaty, have acknowledged the exterritoriality of subjects of other Powers and their property, the Consul or Consuls concerned shall be instructed not to withhold his or their consent to the destruction of a wreck or parts thereof, if it is shown that the wreck constitutes a danger to passing vessels, and if there is no apparent possibility that it will be removed within a reasonable time by the owners or the Insurance Companies interested.

General Division XI

Notice of Dangers to Navigation.

Notice of Changes in Lights, Buoys, and other Day and Night Marks.

(*a.*) A uniform method of taking bearings, of designating them (whether true or magnetic), and of reporting them.

(*b.*) A uniform method of reporting, indicating, and exchanging information by the several maritime nations, to include the form of "Notices to Mariners."

(*c.*) A uniform method of distributing this information.

The Conference invite the several Maritime Powers to consider the following Resolutions, with a view to establishing uniformity in the subjects treated in "Notices to Mariners" and "Light Lists":—

1. That all bearings should be given from seaward.

2. That the bearings of cuts of different coloured sectors of lights or bearings of lights defining a narrow channel should be expressed in degrees where practicable.

3. That all bearings expressed in degrees should count from north and south, from 0° to 90°, towards east and west.

4. That in designating bearings the letter E shall designate east and the letter W shall designate west.

5. That whenever bearings are given the variation of the compass at the place should be stated.

6. That distances should be expressed in nautical miles and fractions thereof. The word "cable" should mean the tenth part of a nautical mile.

7. That whenever the longitude of a position is given, it should be stated which prime meridian is adopted, and if other than that of Greenwich or Paris, the difference of longitude should also be stated.

8. That in defining the visibility of a light it should be stated whether the distance is for "clear" or "mean" state of the weather.

9. That where the geographical range of a light is given it should be calculated as seen at high water from an observer 15 feet, or 5 metres, above the sea.

10. That a uniform classification of lights, based on luminous intensity and on the character as seen by the mariner, should be adopted.

11. That the Central Offices that issue "Notices to Mariners" or "Light Lists" should be permitted to correspond direct on such subjects.

12. That from countries where "Notices to Mariners" are published only in newspapers, copies of such papers should be sent to the various Hydrographic Offices.

General Division XII.

A uniform System of Buoys and Beacons.

(*a.*) Uniformity in colour of buoys.
(*b.*) Uniformity in numbering of buoys.

On the principle of using four colours to mark the four sides of a shoal, the Conference put forward the following scheme, based on the least change that would be necessary in altering the present systems to a uniform plan, and they bring it to the notice of the countries interested as an example showing that uniformity is attainable if they will agree to consider the subject.

All shoals marked on the compass system to be marked—
On the *North* side by a single Black or White colour.
South side by Red.
East side by half Red and half White combined.
West side by half White and half Black combined.

On Rocks in Fairway, with channels on either hand, to be marked Black or Red, with horizontal bands.

If such colours were adopted, then the following changes of colour would be necessary :—

The marks on the *North* side of a shoal would remain coloured Black or White as they now are in all countries using the compass system.

The marks on the *South* side of a shoal would in—
Norway, have to be changed from White to Red.

The marks on the *East* side of a shoal would in—

Norway,	have to be changed from	Black	to half Red and half White.
Sweden,	do.	Black and White	do.
Denmark,	do.	Red	do.

The marks on the *West* side of a shoal would in—

Norway, Denmark,	have to be changed from	White	to half White and half Black.
Sweden,	do.	Red	do.
Finland,	do.	White and Red	do.

The marks on a rock in Fairway, with channel on either side, if a white horizontal band is generally adopted, would in Russia have to be changed from Black to Black or Red with White horizontal bands, in agreement with the other countries.

The Conference invite the various Powers interested to consider the following general principles, which they put forward as a basis on which to build up a uniform international buoyage system for districts other than those where the compass system is in use.

The term "starboard-hand" shall denote that side of a navigable channel which is on the right hand of the mariner entering from seaward; the term "port-hand" shall denote that side which is on the left hand under the same circumstances.

Colour.—Buoys defining the starboard-hand shall be painted a single red colour.

Buoys defining the port-hand shall be painted a single black colour, or a parti-colour.

Buoys defining middle grounds shall be painted with horizontal bands.

Form.—Wherever form is used as a distinctive character—

Buoys defining the starboard-hand shall be conical, and those defining the port-hand shall be can or spar.

Top Marks.—Countries where form is not used as a distinctive character for buoys may adopt as another distinctive feature for the buoys on either side of a channel, top-marks resembling a cone to be used on the starboard side, or a cylinder on the port side of a channel.

Numbers and Letters.—Numbers, letters, and names may be painted on the buoys, but they must never be so large as to interfere with their distinctive colouring.

Wherever numbers and letters are used they shall be in consecutive order, commencing from seaward.

Buoying and marking of Wrecks.—(*a.*) All buoys and the top-sides of vessels used for the marking of wrecks, shall be painted green with a suitable white inscription.

(*b.*) Where it is practicable, by day one ball shall be exhibited on the side of the vessel nearest the wreck, and two placed vertically on the other side; three fixed white lights similarly arranged, but not the ordinary riding light, shall be shown from sunset to sunrise.

General Division XIII.

The Establishment of a Permanent International Maritime Commission

(*a.*) The composition of the Commission.
(*b.*) Its powers and authority.

Resolved,—That for the present the establishment of a Permanent International Maritime Commission is not considered expedient.

On the 31st December, the programme having been completed, the following Resolutions were adopted:—

On motion of Mr. Hall (Great Britain):

Resolved,—That a cordial vote of thanks be tendered by the Conference to its President, Rear-Admiral Samuel R. Franklin, for his courteous, impartial, and able conduct in the chair.

On motion of Dr. Sieveking (Germany):

Resolved,—That the thanks of the Conference be expressed to the Secretaries of the Conference and to the officers detailed by the United States' Government, for their assiduous services and the valuable assistance given by them to the works of the Conference.

On motion of Captain Richard (France):

That the names of the various Secretaries, given herewith, be added to the Resolution of Dr. Sieveking:—

Lieutenant Vincendon L. Cottman, Mr. Cecil A. Spring Rice, M. Walter Blaess, M. Charles Ribière, Permanent Secretaries;

Lieutenant Frank E. Beatty, Lieutenant Edward D. Bostick, Lieutenant Ridgely Hunt, Lieutenant John F. Newton, Ensign William L. Howard, Secretaries to Committees.

The Conference recommend that a copy of this Final Act be transmitted to the various Powers represented.

In the name of the International Marine Conference,

I am, &c.

(Signed) S. R. FRANKLIN, *Rear-Admiral, United States' Navy, President.*

(Signed) V. L. Cottman,
Lieutenant, United States' Navy, Secretary.

Hon. James G. Blaine, Secretary of State,
Department of State.

No. 140.

The Marquis of Salisbury to Mr. Hall, Q.C., M.P.

Sir, *Foreign Office, March* 25, 1890.

I HAVE to convey to you the approval of Her Majesty's Government of your proceedings at the recent Marine Conference held at Washington, and their appreciation of the important and valuable services rendered by yourself on that occasion.

I am, &c.

(Signed) SALISBURY.

No. 141.

*The Marquis of Salisbury to Admiral Sir R. Molyneux.**

Sir, *Foreign Office, March* 25, 1890.

I HAVE to convey to you the approval of Her Majesty's Government of your proceedings at the recent Marine Conference held at Washington, and their appreciation of the services rendered by yourself on that occasion.

I am, &c.

(Signed) SALISBURY.

---

* Also to Admiral Bowden Smith, Admiral Sir G. Nares, Captain H. Wyatt, Captain Kendal, and Mr. Wimshurst

COMMERCIAL. No. 20 (1890)

PROTOCOLS OF PROCEEDINGS

OF THE

INTERNATIONAL MARINE CONFERENCE

HELD IN

WASHINGTON,

OCTOBER 16 TO DECEMBER 31, 1889.

Presented to both Houses of Parliament by Command of Her Majesty.
1890.

LONDON:
PRINTED FOR HER MAJESTY'S STATIONERY OFFICE
BY HARRISON AND SONS, ST. MARTIN'S LANE,
PRINTERS IN ORDINARY TO HER MAJESTY.

And to be purchased, either directly or through any Bookseller, from
EYRE AND SPOTTISWOODE, East Harding Street, Fleet Street, E.C., and
32, Abingdon Street, Westminster, S.W.; or
ADAM AND CHARLES BLACK, 6, North Bridge, Edinburgh; or
HODGES, FIGGIS, & Co., 104, Grafton Street, Dublin.

Protocols of Proceedings of the International Marine Conference held in Washington, October 16 to December 31, 1889.

Sir J. Pauncefote to the Marquis of Salisbury.—(*Received June* 2.)

My Lord, *Washington, May* 23, 1890.

WITH reference to my despatch of the 7th March, I have the honour to transmit herewith the official copy of the Protocols of the International Marine Conference which has just been laid before Congress by the President of the United States.

I understand that Volumes II and III, containing the Reports and Appendices, will not be ready till the end of the month.

I have, &c.

(Signed) JULIAN PAUNCEFOTE.

Inclosure.

Protocols of Proceedings of the International Marine Conference held in Washington, D. C., United States of America, October 16 *to December* 31, 1889.

[All remarks of Captain Richard (France), Admiral Viel (Chile), Captain Saldanha (Brazil), Commodore Monasterio (Mexico), and Captain Torres and Lieutenant Seoane (Spain), were delivered in the French language, of which the text is a translation.]

Detailed Programme of Subjects to be considered by the International Marine Conference.

[Framed by the American Delegates in accordance with instructions from the Department of State, March 1889.]

General Division I.

Marine Signals or other means of plainly indicating the Direction in which Vessels are moving in Fog, Mist, Falling Snow, and Thick Weather, and at night.—Rules for the Prevention of Collisions, and Rules of the Road.

1. Visibility, number, and position of lights to be carried by vessels:—

(*a.*) Steamers under way.
(*b.*) Steamers towing.
(*c.*) Vessels under way, but not under command, including steamers laying cable.
(*d.*) Sailing-vessels under way.
(*e.*) Sailing-vessels towing.
(*f.*) Vessels at anchor.
(*g.*) Pilot-vessels.
(*h.*) Fishing-vessels.

2. Sound-signals; their character, number, range, and position of instruments:—

(*a.*) For use in fog, mist, falling snow, and thick weather, as position-signals.
For steamers under way.
For steamers towing.
For sailing-vessels under way.
For sailing-vessels towing.
(These signals to show the approximate course steered if possible.)
For vessels at anchor.
For vessels under way, but not under command, including steamers laying cable.
(*b.*) For use in all weathers as helm-signals only.
For steamers meeting or crossing.
For steamers overtaking.
For steamers backing.
(*c.*) Whether helm-signals shall be made compulsory or remain optional.

3. Steering and sailing rules:—

(*a.*) Sailing-vessels meeting, crossing, overtaking, or being overtaken by each other.
(*b.*) Steamers meeting, crossing, overtaking, or being overtaken by each other.
(*c.*) Sailing-vessels meeting, crossing, overtaking, or being overtaken by steamers.
(*d.*) Steamers meeting, crossing, overtaking, or being overtaken by sailing-vessels.
(*e.*) Special Rules for channels and tide-ways, where no local Rules exist.
(*f.*) Conflict of international and local Rules.
(*g.*) Uniform system of commands to the helm.
(*h.*) Speed of vessels in thick weather.

General Division II.

Regulations to determine the Seaworthiness of Vessels.

(*a.*) Construction of vessels.
(*b.*) Equipment of vessels.
(*c.*) Discipline of crew.
(*d.*) Sufficiency of crew.
(*e.*) Inspection of vessels.
(*f.*) Uniform certificates of inspection.

General Division III.

Draught to which Vessels should be restricted when loaded.

Uniform maximum load mark.

General Division IV.

Uniform Regulations regarding the Designating and Marking of Vessels.

(*a.*) Position of name on vessels.
(*b.*) Position of name of port of registry on vessels.
(*c.*) Size of lettering.
(*d.*) Uniform system of draught marks.

General Division V.

Saving Life and Property from Shipwreck.

1. Saving of life and property from shipwreck at sea:—

(*a.*) Duties of vessels after collision.
(*b.*) Apparatus for life-saving to be carried on board ship. (Life-boats, life-preservers, life-rafts, pumps, and fire-extinguishing apparatus.)
(*c.*) The use of oil and the necessary apparatus for its use.
(*d.*) Uniform inspections as to (*b*) and (*c*).

2. Saving of life and property from shipwreck by operations from shore:—

(*a.*) Organization of, and methods employed by, life-saving institutions.
(*b.*) The employment of drilled and disciplined crews at life-saving stations.
(*c.*) The maintenance of a patrol upon dangerous coasts by night, and during thick weather by day, for warning off vessels standing into danger, and for the early discovery of wrecks.
(*d.*) Uniform means of transmitting information between stranded vessels and the shore.
(*e.*) Life-boats, life-saving apparatus and appliances.

3. Official inquiries into causes and circumstances of shipwrecks and other casualties.

General Division VI.

Necessary Qualifications for Officers and Seamen, including Tests for Sight and Colour-Blindness.

(*a.*) A uniform system of examination for the different grades.
(*b.*) Uniform tests for visual power and colour-blindness.
(*c.*) General knowledge of methods employed at life-saving stations.
(*d.*) Uniform certificates of qualification.

General Division VII.

Lanes for Steamers on frequented Routes.

(*a.*) With regard to the avoidance of steamer collisions.
(*b.*) With regard to the safety of fishermen.

General Division VIII.

Night Signals for communicating Information at Sea.

(*a.*) A Code to be used in connection with the International Code Signal Book.
(*b.*) Or a supplementary Code of limited scope to convey information of special importance to passing vessels.
(*c.*) Distress signals.

General Division IX.

Warnings of approaching Storms.

(*a.*) The transmission of warnings.
(*b.*) The uniformity of signals employed.

General Division X.

Reporting, marking, and removing Dangerous Wrecks or Obstructions to Navigation.

(*a.*) A uniform method of reporting and marking dangerous wrecks and derelicts.
(*b.*) The division of the labour, cost, and responsibility among the several maritime nations, either by geographical apportionment or otherwise—
Of the removal of dangerous derelicts;
And of searching for doubtful dangers, with a view of removing them from the Charts.

General Division XI.

Notice of Dangers to Navigation.—Notice of Changes in Lights, Buoys, and other Day and Night Marks.

(*a.*) A uniform method of taking bearings, of designating them (whether true or magnetic), and of reporting them.

(*b.*) A uniform method of reporting, indicating, and exchanging information by the several maritime nations—to include the form of Notices to Mariners.

(*c.*) A uniform method of distributing this information.

General Division XII.

A uniform System of Buoys and Beacons.

(*a.*) Uniformity in colour of buoys.

(*b.*) Uniformity in numbering of buoys.

General Division XIII.

The Establishment of a Permanent International Maritime Commission.

(*a.*) The composition of the Commission.

(*b.*) Its powers and authority.

Proposed Grouping of Subjects for consideration by Committees of the International Marine Conference.

1. Rules of the Road and signals—General Divisions I and VIII.
2. Saving of life and property from shipwreck by operations from shore—General Division V, subdivision No. 2.
3. Construction and equipment of vessels, and saving of life and property from shipwreck at sea—General Divisions II, III, and IV, and subdivision No. 1 of V.
4. Qualifications of officers and seamen—General Division VI.
5. Steam lanes—General Division VII.
6. Official inquiries into shipwrecks and other casualties—General Division V, subdivision No. 3.
7. Transmission of warnings and information, buoys, &c.—General Divisions XI, X, XI, and XII.
8. Permanent Maritime Commissions—General Division XIII.

All of which is respectfully submitted.

WILLIAM W. GOODRICH, *Counsellor-at-Law.*

Reception of Delegates and Organization of Conference.

Washington, D. C., Wednesday, October 16, 1889.

IN response to the invitation extended by the President of the United States to all the Maritime Governments to be represented at an International Marine Conference, to secure greater safety for life and property at sea, Delegates from the following countries: Austria-Hungary, Belgium, China, Chile, Denmark, France, Germany, Great Britain, Guatemala, Honduras, Italy, Japan, Mexico, the Netherlands, Norway, Russia, Siam, Spain, Sweden, the United States of America, and Venezuela, assembled at 11 o'clock in the forenoon of the 16th October, 1889, in the Diplomatic Reception-room of the State Department.

After the presentation of the Delegates to the Secretary of State, the latter welcomed them in the following words:—

"Gentlemen,

"It is the cause of extreme gratification to the Government of the United States that its invitation to the Maritime Powers of the world has been met with so general a response. Representatives from Asia, from Europe, from North and South America, and from the isles of the sea

will compose the Conference. On behalf of the United States I welcome you all, Gentlemen, to the honourable, the scientific, the philanthropic duties which lie before you. The already and the rapidly increasing intercourse between continent and continent, between nation and nation, demand that every protection against the dangers of the sea and every guard for the safety of human life shall be provided.

"The spoken languages of the world will continue to be many; but necessity commands that the unspoken language of the sea shall be one. That language must be as universal as the needs of man for commerce and intercourse with his fellow-man. The deep interest which the maritime nations have taken in the questions at issue is shown by the eminent character and the wide experience of the Delegates to whom they have committed the important work. Again, Gentlemen, I welcome you, and after your preliminary organization is completed, it will be my pleasure to present you in person to the President of the United States."

The Delegates having then assembled for permanent organization, Mr. Charles Hall, Q.C., M.P., one of the Delegates from Great Britain, being granted the floor, nominated Rear-Admiral S. R. Franklin, one of the Delegates from the United States of America, as permanent President of the Conference. This motion being seconded by several Delegates, and voted upon in the affirmative unanimously, Rear-Admiral S. R. Franklin was declared elected to the Chair, in accepting which honour he addressed the Conference in the following words:—

"Before proceeding to the further organization of the Conference, I desire to express to the Delegates my high appreciation of the distinguished honour they have conferred upon me in selecting me to preside over their deliberations.

"The little experience which my profession affords in the Parliamentary duties I am now called up to perform encourages me to hope for the indulgence of the Conference in any errors of judgment I may commit.

"I feel that it is needless for me to say that in any rulings or decisions which I may be called upon to make I shall endeavour to be governed by a spirit of entire fairness, and I trust that my efforts will meet the approval of the Conference.

"Thanking you, Gentlemen, for the honour you have done me, I now declare the Conference ready for its further organization."

Mr. William W. Goodrich, a Delegate for the United States of America, then moved that the Conference adjourn until 11 o'clock in the forenoon of Thursday, the 17th October, 1889, to meet at the Wallach House. This motion being voted upon and carried unanimously, the meeting was declared adjourned.

The Delegates were afterwards formally presented to the President of the United States; the latter, standing in the centre of the semicircle, spoke a few informal words of welcome, expressing his gratification that the Conference had assembled under such pleasant auspices. He expressed his deep personal interest in the result which might be anticipated and, he trusted, attained by the Conference, and hoped that the passage of the seas might be made as safe as it has been made rapid.

The President, in conclusion, said that the object for which the Conference had assembled was one which would attract universal interest, and its attainment would be warmly welcomed by all nations.

Washington, D. C., Thursday, October 17, 1889, 11 *o'clock* A.M.

THE Conference met in pursuance of adjournment, with Rear-Admiral Samuel R. Franklin, United States' Navy, the President, in the Chair.

The meeting was called to order at 11 o'clock A.M.

The President.—The business in order will be the further organization of the Conference. Motions are in order for the further organization.

Mr. Hall (Great Britain).—Mr. President, I beg to move that Lieutenant V. L. Cottman, of the United States' Navy, be the First Secretary of the Conference.

The motion, being duly seconded, was put and was unanimously carried.

Mr. Goodrich (United States).—Mr. President, I move that Mr. Cecil A. Spring Rice be the Second Secretary of the Conference.

The motion, being duly seconded, was put and was unanimously carried.

The President.—Mr. Spring Rice is one of the Secretaries of the Conference. Are there further motions?

Dr. Sieveking (Germany).—Mr. President, I move that Mr. Charles Ribière be one of the Secretaries of the Conference.

The motion, being duly seconded, was put and unanimously carried.

And, upon the motion of Captain Richard, Mr. Walter Blaess, the Secretary of the German Delegation, was elected a Secretary of the Conference.

And thereupon the roll of the Conference was called, and the following members answered to their names:—

Austria-Hungary—
Baron de Spaun, Rear-Admiral, Imperial-Royal Navy.
Lieutenant Anton Sanchez de la Cerda, Aide-de-camp and Secretary to Admiral de Spaun.

Belgium—
Mr. Theobald Verbrugghe.

China—
Captain A. M. Bisbee.
Commander Chen Ngen Tao, Chinese Navy.
Lieutenant Chia Ni Hsi, Chinese Navy.

Chile—
Rear-Admiral Oscar Viel, Chilean Navy.
Lieutenant Ricardo Beaugency, Chilean Navy.

Denmark—
Mr. August Garde.
Mr. A. Schneider.

France—
Captain E. Richard, Naval Attaché, French Embassy at London.
Captain Henri Lanneluc, Vice-President of the Geographical Society of Bordeaux.
Mr. Henri Vetillart, Engineer-in-chief of Bridges and Roads.
Mr. Charles Ribière, Engineer of the First Class.
Mr. George Denis Weil, Judge of the Tribunal of the First Instance of the Seine.

Germany—
Dr. F. Sieveking, of Hamburg, President of the Hanseatic High Court of Appeal.
Captain A. Mensing, German Navy.
Mr. August Feigel, Consul-General of Germany at New York.
Privy Councillor Christian Donner, Retired Captain, German Navy.

Great Britain—
Mr. Charles Hall, Q.C., M.P.
Admiral Sir R. More Molyneux, K.C.B.
Admiral N. Bowden-Smith.
Mr. Thomas Gray, C.B., Assistant Secretary, Marine Department, Board of Trade.
Admiral Sir George Nares, K.C.B.
Captain Henry Wyatt, Peninsular and Oriental Steam-ship Company.
Captain T. G. Kendall, Dublin Steam Packet Company.

Italy—
Chevalier Raphael Settembrini, Captain, Royal Navy.

Japan—
Shiuzo Tsukahara, Imperial Department of Communications.
Lieutenant R. Baba, I. N., Naval Attaché to Japanese Legation at Washington.

Mexico—
Señor Don Matias Romero, Mexican Minister to Washington.
Señor Don Angel Ortiz Monasterio, Commodore, Mexican Navy.

Netherlands—
Mr. D. Hubert, Captain, Steam Navigation Company,
Mr. G. H. Van Steyn, Commander, Netherlands Royal Navy.

Norway—
Mr. T. Salvesen, Captain, Norwegian Royal Navy.
Mr. S. W. Flood, Agent of the several Maritime Insurance Companies in New York.

Russia—
Vice-Admiral Kaznakoff, Imperial Navy, Chief Inspector of Marine Artillery.

Siam—
Mr. Frederick Verney, of the Siamese Legation in London.

Spain—
Señor Don I. Varela de Torres, President of the Spanish Marine Commission in New York.
Don Baldomero Vega de Seoane, Lieutenant, Spanish Navy.

Sweden—
Mr. Frederick Malmberg, Chief of the Nautical Meteorological Bureau, Captain, Royal Navy.

Venezuela—
Señor Francisco Antonio Silva, Chargé d'Affaires of Venezuela at Washington.
Señor José Andrade, Venezuelan Commission on American Claims.

United States—
Rear-Admiral Samuel R. Franklin, United States' Navy, President.
Captain William T. Sampson, United States' Navy.
Sumner I. Kimball, General Superintendent, United States' Life-saving Service.
Captain James W. Norcross, Master, Merchant Marine.
Captain John W. Shackford, Master, Merchant Marine.
William W. Goodrich, Esq., Councillor-at-Law.
Clement A. Griscom, President of the International Navigation Company.

Secretaries—
Lieutenant V. L. Cottman, United States' Navy.
Mr. Cecil A. Spring Rice, Great Britain.
Mr. Walter Blaess, Germany.
Mr. Charles Ribière.

Mr. Goodrich (United States).—Mr. President, I move that "Crocker's Manual" be adopted as the rule of Parliamentary procedure for the Conference. In making this motion, I would say to the members that this little volume, of which copies will be furnished to-morrow, is a book very highly recommended to the President of the Conference by the late Mr. Cox, a Member of Congress, and an acknowledged authority upon Parliamentary Law.

The President.—It is moved that "Crocker's Manual" be adopted as the rule of Parliamentary procedure for this Conference.

The motion was put and carried unanimously.

Captain Sampson (United States).—Mr. President, I desire to offer the following Resolution:—

"*Resolved*,—That the hours of the sitting of the Conference be from 11 A.M. to 4 P.M., with an hour of recess at 1 P.M. on Monday, Tuesday, Wednesday, and Thursday, and from 10 to 1 o'clock on Friday."

The object of the change on Friday is to give those who wish to leave town an opportunity to take the afternoon train.

The Resolution was read by the Secretary, and being put by the President, was unanimously adopted.

Mr. Goodrich (United States).—Mr. President, I move that 250 copies of the present International Rules of the Road, as adopted in 1884, be printed in English, and 200 copies in French, on paper having a wide margin for annotations, and that a Memorandum be added showing the differences of the English and American Rules.

I would say that at a preliminary meeting of the American Delegates in the spring, Lieutenant Staunton, who was at that time acting as the Secretary of the American Delegation, prepared a list, which I have here, showing the differences in the two Codes. I speak here of those only the language of which I understand, which is English. The chief difference in the Rules is in regard to Article 10, and especially section (*a*), about fishing-vessel lights. I suggest that, if we have these copies of the English Code printed as they were published in 1884, and then the amendments by Act of Congress in 1885, we shall be able to have a paper at our hand upon which we can act understandingly, and that it be printed upon wide sheets, so that we can make annotations as we see fit.

Captain Sampson suggests, also, that it would be very wise if a similar Memorandum be made in regard to any differences between the English Code and the Code of each nation here represented. I have purposely made my Resolution refer to printing the English Rules as being the leading Maritime Rules of the world. They were first adopted by England, and subsequently by the other Powers. I think 250 copies in English and 200 copies in French will be sufficient.

The President.—Will you be kind enough to put that motion in writing?

The motion was thereupon read by the Secretary, as follows:—

"*Resolved*,—That 250 copies of the present International Rules of the Road, as adopted in 1884 by England, be printed in English, and 200 copies in French, on paper having a wide margin for annotations, and that a Memorandum be added showing the differences of the English and American Rules."

Mr. Hall (Great Britain).—Mr. President, I would move that, in addition to the Rules of the 15th August, 1884, which are the general Rules to which the learned Delegate has referred, we have printed some of the subsidiary Rules, which I dare say have escaped his attention, which were published on the 30th December, 1884, and on the 24th June, 1885. One is with regard to fishing-vessels, and the other with making slight alterations in the Rules of 1884, which I need not refer to in detail. They are generally bound up and printed with the Rules of 1884, and probably they may be included within the words of the motion of Delegate Goodrich; but to prevent any doubt, I move that they be printed altogether.

Mr. Goodrich (United States).—Mr. President, I accept the amendment.

Mr. Hall (Great Britain).—Mr. President, before proceeding to discuss the various matters to be dealt with in this Conference, I think it is desirable that I should state briefly the instructions which Her Majesty's Government have given to my colleagues and myself. I need not say that Her Majesty's Government are most anxious that the deliberations of this Conference should have a permanent result in arriving at conclusions upon these very important matters in which the interests of all maritime nations are altogether in common, and on the consideration of which their views will probably be harmonious.

Her Majesty's Government recognize that in the institution of this Conference by the United States their object and aim had been to promote the universal interests and welfare of the whole of seafaring humanity. Under these circumstances Her Majesty's Government have thought it desirable to limit their instructions to my colleagues and myself to the matters set down in General Divisions I and III. In doing this they wish it to be clearly understood that, whilst they do not see any reason at the present moment to object to the subjects contained in the Programme, as in themselves unsuitable for international discussion, the scope of the Programme appears to them too extensive to afford any prospect that the Conference can arrive at valuable conclusions upon all the subjects proposed within any session of reasonable duration.

I may also point out that circumstances may arise during the Conference which may render the discussion of some one or other of the subjects unnecessary. And it is for these reasons and from their anxious desire that a practical result may flow from the proceedings of this Conference that Her Majesty's Government have thought it desirable to limit their instructions as I have mentioned. I may add, on behalf of my colleagues and myself, that we shall use our best endeavours to render to the Conference all the assistance that lies in our power, and we beg to offer our hearty congratulations to our foreign colleagues upon our having been able to secure the valuable co-operation of yourself as their President.

In accordance with the understanding arrived at between the Government of the United States and that of Her Majesty, the British Delegates will not have power to bind Her Majesty's Government; any proposal which the British Delegates will make and any action which the Conference may adopt or recommend will be *ad referendum* only for the consideration and decision of Her Majesty's Government.

Mr. Goodrich (United States).—Mr. President, I move the following Resolutions:—

"*Resolved*,—That the Conference proceed to the discussion of General Division I of the proposed detailed Programme as framed by the American Delegates, and continue the consideration of the same until its completion.

"*Resolved*,—That the Articles of the revised Regulations for Preventing Collisions at Sea, and known as the International Rules, be considered Article by Article, in numerical order.

"*Resolved*,—That each nation represented in the Conference be entitled to one vote upon each motion or question presented."

The President.—Do you offer those as separate Resolutions?

Mr. Goodrich (United States).—Mr. President, in any way the Conference sees fit to act upon them.

The President.—It would be preferable to offer them as separate Resolutions.

Mr. Goodrich (United States).—Mr. President, then I will move the last of them first, as to the right of each nation to cast one vote, as follows:—

"*Resolved*,—That each nation represented in the Conference be entitled to one vote upon each motion or question presented."

The Resolution was submitted to the Conference and adopted.

The President.—The Secretary will now please read the next Resolution.

The Secretary read as follows:—

"*Resolved*,—That the Conference proceed to the discussion of General Division I of the proposed detailed Programme as framed by the American Delegation, and continue the consideration of the same until its completion.

"*Resolved*,—That the Articles of the revised Regulations for Preventing Collisions at Sea, and known as the International Rules, be considered Article by Article, in numerical order."

The Resolutions were presented to the Conference, and were unanimously adopted.

The President.—The Chair will say to the Conference that owing to the inevitable delay in procuring the services of a French stenographer, it would seem to be inconvenient to go on with the discussion this morning except in English. If there be no objection to this we can proceed, and the matter will appear in the Protocol afterwards in both languages. If there be suggestions upon this subject, I should be very glad to hear them.

Mr. Goodrich (United States).—At the suggestion of the President, I present the following Resolution:—

"*Resolved*,—That the discussions and proceedings of the Conference be conducted in English or French, and that the Protocol be printed in both languages."

The Resolution was read by the Secretary, and was unanimously adopted.

The President.—The Chair would like a suggestion as to the manner of proceeding, or otherwise, without the French stenographer. It was expected that he would be here this morning, but he missed the train. If there be no objection, however, the Conference will proceed as indicated by the Resolution.

Mr. Goodrich (United States).—Mr. President, I move that the first section of the International Rules be read.

The Secretary read Article 1, as follows:—

"Article 1. In the following Rules, every steam-ship which is under sail, and not under steam, is to be considered a sailing-ship, and every steam-ship which is under steam, whether under sail or not, is to be considered a ship under steam."

Mr. Goodrich (United States).—Mr. President, I move the following as a substitute for that Article: "In the following Rules every steam-vessel"—I am changing the word "ship" to "vessel"—"every steam-vessel which is under sail and not under steam is to be considered a sailing-vessel, and every steam-vessel which is under steam, whether under sail or not, is to be considered a vessel under steam."

In making this proposition, I am led to it for some reasons which I will state as briefly as possible.

The President.—I think the Secretary had better read that Resolution for the information of the Delegates.

The Secretary read as follows:—

"Article 1, as proposed:

"In the following Rules, every steam-vessel which is under sail and not under steam is to be considered a sailing-vessel, and every steam-vessel which is under steam, whether under sail or not, is to be considered a vessel under steam."

Mr. Goodrich (United States).—Mr. President, I think I may say a few words in regard to this motion or this subject before the Conference, as indicating my own position upon the Code. I desire to preface my remarks by stating that while the United States' Delegates have not conferred upon the subject for reasons known to themselves, they will hereafter have such arrangements as will enable them to speak unitedly.

In looking over these Regulations any one will discover a number of verbal inaccuracies, and that language is used which does not cover the object intended. I do not believe that this Code as now adopted by the maritime nations is as sacred as the Ark of the Covenant, upon which we may be afraid to lay our hands for its betterment. While I propose to be as conservative as possible in regard to unnecessary changes in these Rules, I am led to the belief that while we are here assembled, at great inconvenience to ourselves, we ought to make this Code as perfect as possible. For the first time in the history of the world a Conference of all the Maritime Powers has assembled to formulate a Code. We are to proceed, perhaps, on the theory that learning, ingenuity, and experience have been brought to bear in the formation of the Code as it now exists, but we must also remember that the various Powers have selected men peculiarly fitted to the framing of a perfect Code, and I think I do not magnify our office, Gentlemen, when I say that if we faithfully and fitly discharge our duties, we shall enact a Code which will be as permanent as the Laws of Oleron, or in a more limited sphere, as distinguished as the Code Napoléon or the Pandects of Justinian. It is to me the proudest moment of my life that I am permitted to unite with the distinguished Representatives of foreign Governments in the establishment of these Regulations for the government of vessels at sea.

Now, a word about the use of the terms "vessel" and "ship." I find in an English decision in the "Libra" case the following language by Judge Jessel, the late Master of the Rolls, who said:—

"It must be remembered what these Rules are. They are issued for the guidance of masters of vessels, and therefore the proper mode of construing them is to read them literally. . . . . Certainly, Rules issued as these are should be construed literally if they can be construed at all."

I believe that citation was approved by Judge Brett, the present Master of the Rolls, in another case.

In other words, says the Court, these Rules must be construed by the Courts literally, viz., without intending any play upon words—as an illiterate sailor would construe them; because, gentlemen of the Conference will observe, these Rules of the Road are to be used in two forums. The first is the deck of the ship, amid excitement and danger; and the other is the Court, in the cooler and more quiet atmosphere of judicial investigation. It is exceedingly desirable, as Judge Jessel has said, that these Rules should be so framed that they may be construed literally by the man who has, if I use the proper sailor-phrase in the presence of these distinguished naval gentlemen, climbed from the forecastle and jumped from the taffrail.

I read the word "ship" to be what Webster defines "ship" to be—"one indicating a particular naval structure." "Vessel" is more comprehensive. It is a generic term. Let us see what Webster says. He defines "vessel" as "any structure made to float upon the water for the purpose of commerce or war, whether propelled by wind, steam, or oars." He defines the word "ship" as "any large sea-going vessel." Secondly, "as what we technically know as a ship or vessel, a three-mast square-rigged," &c.

Now, I would suggest that right here, at the beginning of these Articles, we make the wording such that it may be construed absolutely literally; and when we speak of a "ship," let us mean ship, and when we mean a boat, or a trawler, or pilot-vessel, let us say so; but when we speak of the whole class of marine structures, let us use the word "vessel."

Now, let me also call your attention to the fact that in these Rules upon the table, headed "Circular.—Lights, Steering and Sailing Rules, &c., to prevent Collisions at Sea," issued by the Treasury Department, the same etymology is used, and it arises as follows: In the Revised Statutes, section 4233, which was passed, I think, in 1864, the word "steam-vessel" was used. In the Thames River Act, I notice, and call the attention of the English Delegates to the fact to correct me if I am wrong, that the word "vessel" was sometimes used, and I do not know but that it was always used. I am not quite certain of that. I find that in the Thames River Act in 1880 it was found necessary to say what the word "vessel" meant. I found this morning, when the subject was called to my attention, that the Thames River Act does define what the word "vessel" shall mean.

In other words, even the English Act of Parliament was so uncertain in the use of the word "ship" that it was found necessary to add another section to the Statute, which defines the use of the word "vessel."

Gentlemen may say at once, especially gentlemen of my own profession, Do not disturb what has already been construed by the Courts. That is a very good rule, and if these Rules were to be construed by Courts alone there would be no necessity for a change. But, as I have said before, these words are to be construed by sailors, and acted upon long before the Courts are called upon to construe them, and under circumstances brought to their attention by some accident or difficulty. If, however, the

word "vessel," which refers to every maritime structure, according to its ordinary acceptation, be used, any one can understand it. I may confess that when I first read these Rules the question arose in my mind, after reading this first Article, whether it was confined to steam-ships or sailing-ships, or whether there were other provisions in the Act which related to smaller craft. Of course this is rather an important discussion, or the opening of a discussion, for the reason that if we make this change there will be other changes in the Act which must necessarily follow; and perhaps it is due to that importance that we should postpone taking a vote upon it, unless it is the unanimous opinion of the Conference that such a change is proper. I may add, and I am speaking of what you all know, that in other sections of these Rules the words "fishing-vessels," "drift-net vessels," "all vessels," "fishing-boats" are used; and with a little care, commencing in the line which I have indicated, we can carry the same thought through all of these Rules without impairing their resemblance to the present Rules and Regulations.

Mr. Hall (Great Britain).—Mr. President, I am sure that my brother Delegates will agree with the learned Delegate from the United States in the sympathetic words which he has used, and in the desire which he has expressed that the results of this Conference and the Rules which may be framed by this Conference may be worthy of the occasion. I think that we all feel that it is a most desirable thing that we should endeavour to frame these Rules in such a manner that they should be harmonious and be capable of being read without any difficulty; also, that the phraseology should be of such a nature that it can be easily understood, not only by seamen but by laymen, and *vice versâ*. For that reason we Delegates for Great Britain, at any rate, so far as we can see, agree to the proposition which has been submitted by the Delegate from the United States. Of course it is a serious change to make without consideration. But we see not only no objection to it, but we see that probably it will be fraught with considerable advantage if we adopt the proposal which has been made to the Conference.

But before I finally state our views as to that, I would like to say briefly a word or two with regard to what has fallen from Delegate Goodrich with regard to the framing of the Rules. It is perfectly true that the words "ship" and "vessel" are used apparently in one sense. They may appear to be used indiscriminately. But our Courts have always placed a definition upon the word "ship." In our Courts the word "ship" has always been held to be every vessel not propelled by oars. But when it came to framing Rules for the River Thames, where you have to frame Rules not merely for vessels not propelled by oars, but you have to frame Rules for all the numerous craft which ply upon the Thames, many of them of considerable size, which are propelled only by oars, it was then necessary to use the word and to have the definition laid down that the word "vessel" was to include not merely vessels not propelled by oars, but all vessels, of every possible description, whether propelled by sails or oars. I point that out as the reason why the Thames Rules adopted the word "vessel."

But, as the learned Delegate from the United States has pointed out, if we adopt this phraseology in the first Rule, no doubt we shall have to take great care in framing the succeeding Rules, so that they shall always be harmonious with the word used in Article 1. I confess, myself, that I am inclined to view with great satisfaction the proposition that we should have our Rules all drawn using the same words if possible. Of course, as the Delegate from the United States has pointed out, this Rule, although it appears only a form of words, is a matter of very great importance. I should not like to give a decision on the point without our being able to consider it. I do not know, Sir, whether or not you propose to have a second reading of the Rules or merely to have a single reading of them. I do not know, Mr. President, what would meet the views of yourself or the members of the Conference upon that point. If there is only one reading, I think it is desirable that we should be able to have the proposed Rules before us, because I have not a copy before me of the present proposed Rule, and it is very difficult to carry in one's mind the exact wording of a clause. I should like to have it before me so that my brother colleagues and I can see it. If the proposition be to have a second reading of these Rules, I should certainly, so far as my colleagues and myself are concerned, support the first reading of the Rule which Delegate Goodrich has proposed.

Mr. Goodrich (United States).—Mr. President, I presume my friend uses the language of Parliament in regard to the first and second readings. Does he mean a first reading, with a second reading immediately following?

Mr. Hall (Great Britain).—Mr. President, what I mean is that if there is a first reading, it is always proper upon the second reading to point out any objection if any one has overlooked something. It is not irrevocable upon the first reading; for if it is cumbersome it can be amended. I propose that the proposition be printed so that we can each have a copy of it before us, and then we can determine to vote upon it to-morrow, or at any time it is desirable. All that I desire to point out is that it would be undesirable to vote upon such a proposition until we have it already before us and are able to consider it amongst ourselves.

Mr. Goodrich (United States).—Mr. President, I am very glad that this method of discussion has arisen. These are questions as to what is the better course for us to pursue after due deliberation and care. I really do not see any necessity for first and second readings in pursuance of the Parliamentary practice. Even in the United States we have a first and second, and even a third reading. But in practice the first is simply the reading of the Bill by its title, and the second is the same, while the third involves the discussion of the Bill. All of that is perhaps a necessity in great legislative bodies, but I doubt whether it is necessary here. I do not even suppose that the passage of a Resolution adopting the first Article, for instance, would be finally binding upon all the members, because all of that could be reviewed when we came to read over the entire Articles for adoption as a whole. So it seems to me that unless the learned Delegate from Great Britain has some desire to have a first and second reading that there will be no necessity for it. But it may be well to have a sort of an understanding—an unwritten law here—that we do not pass upon any Article upon the day of its reading, or until the amendment has been printed and submitted, even for forty-eight hours, but

certainly for one day. Without any formal Resolution I presume that we might consider that as one of the unwritten laws of the Conference.

The President.—What action do you propose to take upon the Resolution at the present time?

Mr. Goodrich (United States).—Mr. President, I suggest that this amendment be printed and furnished to the Delegates to-morrow morning.

The President.—It will have to be laid on the table to-morrow morning.

Mr. Hall (Great Britain).—Mr. President, then we could deal with it on the following day. That would be forty-eight hours from the proposal. We should receive it in print on the following morning, so that it would give us a fair day after we received it in print to consider it.

The President.—If there be no objection that course will be pursued. The Resolution will be will be laid on the table and given to the Delegates to-morrow to be considered on the following day.

The President.—Shall the second Article be now read? The Secretary will please read the second Article.

The Secretary read the second Article, as follows :—

"*Lights.*

"Article 2. The lights mentioned in the following Articles numbered 3, 4, 5, 6, 7, 8, 9, 10, 11, and no others, shall be carried in all weathers, from sunset to sunrise."

The President.—Article 2 is before the Conference.

Captain Salvesen (Norway).—Mr. President, the meaning of the word "carry" in this Article is not clear. It refers not only to fixed lights, but to lights (such as those mentioned in Article 11) which have only to be shown and not allowed to be carried.

Mr. Goodrich (United States).—Mr. President, will the gentleman from Norway allow me to say that perhaps his suggestion is met in Article 3, where it expressly says that "a sea-going steam-ship, when under way, shall carry on or in front of the foremast, at a height above the hull of not less than 20 feet, and if the breadth of the ship exceeds 20 feet, then at a height above the hull not less than such breadth, a bright white light," and so on? And so in regard to coloured lights on the starboard side: "A green light, so constructed as to show a uniform and unbroken light over an arc of the horizon," &c. If your attention is called to that, it may meet your suggestion.

Captain Richard (France) thereupon addressed the Conference in French, which was not reported.

The President.—The Delegate from France proposes to discuss Article 2 at some future time. This is a very important subject, and I think it would be well to pass it over now and take up each Article separately. Do I understand correctly that the general discussion of that Article is to be passed over for the present?

Mr. Hall (Great Britain).—Mr. President, I quite agree with the gallant Delegate from France that it is undesirable to pass this Rule, stating the numbers of the Rules to which it is to apply, because we may deal with the Rules which come after this, and it might render it unnecessary to pass all that portion of Article 2. I apprehend that it will be necessary for us, before we consider especially the Articles to which it refers, to consider generally what the lights are which are to be carried by vessels at sea, and then to discuss afterwards the Rules *seriatim*. I apprehend that it will be a waste of time to discuss the Rules which follow this *seriatim* until the Conference has determined generally upon what the lights are which are to be carried by vessels at sea. I think that that is what my friend, the gallant Delegate from France, meant in the observations which he addressed to the Conference. It was not that we should not discuss what the lights to be carried ordinarily by vessels at sea should be, but that it was useless to say that Articles 1, 2, 3, 4, 5, 6, 7, 8, &c., should be controlled by this Article until we considered those Articles in their order to see whether or not a general Rule should apply to vessels and whether there should be exceptions.

The President.—I so understood the Delegate.

Mr. Hall (Great Britain).—Mr. President, then I think it will be the better course to pursue to leave the numbers in blank, and decide, first of all, generally upon what lights are to carried by vessels at sea, and then we can insert the numbers of the Rules afterwards.

Mr. Verney (Siam).—Mr. President, I do not know that I shall be in order in proposing that we go on with the discussion of Article 3, in accordance with what my friend, Mr. Hall, and what the gallant Delegate from France have just proposed.

Mr. Hall (Great Britain).—Mr. President, before we proceed to do that I would say, with regard to the observation which has been made in regard to the word "carry," if a word is to be suggested instead of the word "carry" we should have notice of it, so that we can consider whether or not it is a desirable substitution for the word "carry." I think we had better have notice what is proposed in that respect before we go to the discussion of Article 3.

Captain Salvesen (Norway).—Mr. President, I think the word "carry," translated into many languages, has different meanings. If it means that these lights have to be exhibited from sunset to sunrise and used, I think a word like "used" would be proper.

The President.—Does the Delegate from Norway propose another word?

Captain Salvesen (Norway).—No, Sir.

The President.—Are you ready to suggest a substitute for the word "carry"? That word has been objected to, but there is no proposition for a substitute. Will the Delegate from Siam please state his motion?

Mr. Verney (Siam).—Mr. President, my motion was that we go on and discuss Article 3. I was under the impression that that was proposed by the gallant Delegate from France and the learned Delegate from Great Britain.

The President.—I do not understand that there is a motion before the Conference as to what disposition shall be made of Article 2.

Mr. Verney (Siam).—Mr. President, I am asked to withdraw my motion for a moment.

The President.—The motion was made by the Delegate from France to pass over for a moment Article 2. Those who are in favour of that motion will say "Aye."

The motion was carried.

Mr. Goodrich (United States).—Mr. President, I think it would be wise to ask Captain Salvesen to formulate his proposition, so that we can have it in print to-morrow.

Captain Salvesen (Norway).—Mr. President, I proposed the words "carried or used."

Mr. Goodrich (United States).—Mr. President, another Delegate suggests the words "displayed or carried."

The President.—The amendment of Captain Salvesen will now be read.

The Secretary read the amendment as follows:—

"The lights mentioned in the following Articles, numbered , and no others, 'shall be carried or used' in all weathers, from sunset to sunrise, in the manner therein prescribed."

The President.—Do I understand this to be a substitute for Article 2?

Mr. Salvesen (Norway).—It is properly a substitute.

Mr. Verney (Siam).—I venture to suggest, Mr. President, that before going into the discussion of these very intricate matters it would be advisable for the Delegates to decide whether these matters are not better dealt with by Committees, which shall report to the Conference. I understand that that has been in the minds of some other members of the Conference, and I venture to make the formal motion in this matter to bring it before you for discussion at this early stage of the Conference, as to whether we should not transact the business in a more expeditious manner, and whether the business will not be more satisfactorily done when we come to discuss these matters in detail by means of Committees. I would ask those gentlemen who are more competent than myself, and more instructed in these matters in this country, whether that is not the best manner of procedure.

Mr. Goodrich (United States).—Mr. President, that matter has been suggested and discussed among several members of the Conference, and I think the ultimate conclusion reached by this informal discussion was that we should get better information, even if it did take a little more time, by discussing in a body the various propositions. There may come a time when for the formulation of a Rule or an Article, after the subject has been fully discussed, a Committee might be appointed to embody the sentiment of the Conference into apt English words. That possibly might be done better by a small Committee; but I really think that the discussions, at least for some time to come, had better be in the whole Committee or in the whole Conference. While I dislike to take so much time as we are likely to take here, yet, as I said before, we are embarked in a great work, and we may well spend a great deal of time even over the dotting of an "i" or the crossing of a "t."

Señor Romero (Mexico).—Mr. President, it is with very great diffidence that I venture to speak on this occasion. I find that there is a provision in the Parliamentary Rules providing for the appointment of Committees. I am not sufficiently familiar with these many questions to decide upon it; but it seems to me this matter, as well as any other, will be much better considered in Committees and adjusted there, and when brought to the knowledge of the Conference a great deal of time will be saved. It has been the universal rule with Parliamentary bodies to organize themselves into Committees, and experience has shown that that is the best way to save time, and it is so regarding this Conference. It seems to me that it is a very important point that these Parliamentary rules provide that Committees shall be appointed, and that it would be the proper thing to do—to appoint Committees to consider these things. Of course they would consist of competent men who could digest these questions, and I have no doubt that time will be saved in that way.

Mr. Hall (Great Britain).—Mr. President, I quite agree with the learned Delegate from Siam and the distinguished Delegate from Mexico that it may be desirable that, at some stages or stage in our proceedings, a Committee or Committees should be appointed. I think it highly possible that we may arrive at technical matters in which a Committee, composed of experienced men in that particular branch, may assist the Conference very much with the result of their deliberations in Committees; but I cannot help thinking that, upon a question such as this, which I take to be a very important question of principle and not a technicality, we should have all the assistance we can get from all the members of the Conference. We should have all the assistance we can get upon the general question as to what the lights are which are to be carried by vessels at sea. I do not think that requires any particular knowledge or knowledge of technicality. I think that the broad principle as to what lights vessels of all nations shall carry at sea is one that this Conference ought to decide, and, if it is a proper thing to be decided, it ought to have the assistance of all the Delegates who have come to assist in its deliberation.

Señor Romero (Mexico).—Mr. President, I desire, in answer to some of the remarks made by the learned Representative from Great Britain, to say a few words. I have, of course, very great regard for his experience. I cannot say I have much experience myself. My experience is very limited as compared with his. It is with diffidence that I venture to make some suggestions in this case; but it seems to me that a great deal of time would be saved by the appointment of Committees, and that they would not interfere with the discussion and the knowledge of all members of the Assembly in regard to these matters or prevent them from going before the Committees. In other words, the Committee present their views to the Conference. Sometimes the members of the Committee do not agree, and you have the two sides of the question. It is much easier, especially for such Delegates as myself who are very little familiar with the questions discussed here, to make up their minds in that way. Therefore, the appointment of Committees would save a great deal of time.

Besides, as I said before, I find here in the Rules which have been adopted a provision for Committees, and as we have accepted these Rules I think that we will have to comply with them.

Captain Sampson (United States).—Mr. President, if the Delegates had decided to consider all the questions contained in the Programme which has been submitted to the Conference, I think then it would have been eminently proper to appoint Committees to consider the different Divisions in this Programme. But as the Conference has already adopted a Resolution to take up but one Division at a time for discussion, I do not think it desirable. In this case of lights and Sailing Rules, it seems to me that it is impracticable to divide the subjects, because they are so connected and interwoven that at every point every individual must have the same subject in mind. That is to say, if we should divide the subject we would find that the different Committees were working at cross purposes. The Division which we are considering does not lend itself properly to a division which could be considered by Committees. In view of the fact that we have decided to consider this division by itself, it seems to me that it is eminently proper that we should consider it in Conference and not in Committees.

My friends remind me that the rule laid down in "Crocker on Parliamentary Law" is a permissive rule, and we are not obliged to divide into Committees in considering this question. It provides for Committees, but we are not necessarily to be divided into Committees.

The President.—The Chair would state that some experiments were made by some of the naval vessels of the United States during the past summer upon running lights and fog-signals, which are now being printed and will be presented to the Conference in a few days. There were some plates connected with them, which will not be available for a few days. As that is very pertinent to the subject we are now discussing, I would suggest that no positive action be taken on this Rule until these Reports are available. There seems to be no disposition on the part of any Delegate to suggest anything with regard to a change of lights. When this subject comes before them in the shape of experiment, perhaps there will be some suggestions on that subject. It is rather premature to dispose of a subject as important as the one we are now considering on a snap judgment.

The Chair does not understand that there has been any motion made to appoint Committees. It was merely a suggestion.

The motion before the Conference is that made by the Delegate from Siam, to proceed to the consideration of Article 3.

Mr. Goodrich (United States).—Mr. President, the amendments to Article 2 are to be printed and presented to-morrow?

The President.—They are.

The motion to proceed to the consideration of Article 3 was put by the Chair, and was carried.

The President.—The motion is carried. Article 3 is now under consideration. The Secretary will please read Article 3:—

"*Lights for Steamers.*

"Article 3. A sea-going steam-ship, when under way, shall carry—

"(*a.*) On or in front of the foremast, at a height above the hull of not less than 20 feet, and if the breadth of the ship exceeds 20 feet, then at a height above the hull not less than such breadth, a bright white light; so constructed as to show a uniform and unbroken light over an arc of the horizon of twenty points of the compass, so fixed as to throw the light ten points on each side of the ship, namely, from right ahead to two points abaft the beam on either side, and of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 5 miles.

"(*b.*) On the starboard side, a green light, so constructed as to show a uniform and unbroken light over an arc of the horizon of ten points of the compass, so fixed as to throw the light from right ahead to two points abaft the beam on the starboard side, and of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 2 miles.

(*c.*) On the port side, a red light, so constructed as to show a uniform and unbroken light over an arc of the horizon of ten points of the compass, so fixed as to throw the light from right ahead to two points abaft the beam on the port side, and of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 2 miles.

"(*d.*) The said green and red side-lights shall be fitted with inboard screens projecting at least 3 feet forward from the light so as to prevent these lights from being seen across the bow."

Captain Malmberg (Sweden).—Mr. President, the beginning of this section mentions sea-going steam-ships when under way. The learned Delegate from the United States mentioned, in regard to Article 1, that the word "steam-ship" should be changed to "steam-vessel." Now here in these Rules appears "sea-going steam-ships." Taking that Article literally, it would not apply to steamers going on lakes or rivers or such waters. In the translation of these Articles into the Swedish, it reads steamers, all steamers, without exception, have to carry such and such lights. In our Rules the word "sea-going" is omitted, and the Rules apply to all steamers. I should think, in framing the Article in English, the word "sea-going" should be omitted, so that it would have reference to every steamer.

The President.—Will you put that in the form of an amendment?

Mr. Goodrich (United States).—Mr. President, I think perhaps it is proper at this jnncture, when we are all seeking light, for each one of us to indicate the differences from the English Rules, which I suggest that we take as a standard. I think that it may not be uninteresting to the Delegates to know precisely how the American law stands. Up to 1840 there were no enunciated Rules of the Sea. I believe the first of the English Acts was in 1854. There was a Rule in 1840, I believe one single Rule, about the direction in which vessels should pass, and then in the "Merchant Shipping Act" in 1863 there were other Rules which became the rudiments of the present Rules. In 1864—and here considerable confusion will arise unless it is distinctly understood—in 1864 the United States adopted practically the English Rules. These remained in that condition until

England adopted the Rules of 1879; but it was not until 1885 that the United States adopted these Rules. When the United States adopted them they adopted them with some little differences, and these are the differences to which I adverted in speaking of the printing of the English and American Rules.

The Act of Congress provides that the following "revised International Rules and Regulations for Preventing Collisions at Sea shall be followed in the navigation of all public and private vessels of the United States upon the high seas and in all coast waters of the United States, except such as are otherwise provided for."

When Congress came to the final clause of the Act it adopted these International Regulations. It provided for the repeal of all Laws and parts of Laws inconsistent with the revised International Regulations for Preventing Collisions at Sea, and that they "shall be followed in the navigation of all public and private vessels of the United States in the high seas and in all coast waters of the United States, except such as are otherwise provided for." It then added an exception as to the navigation of such vessels within the harbours, lakes, and inland waters of the United States. Thus the members of the Conference will see that the revised International Rules and Regulations, as adopted by England, with the amendments I have suggested, became the American law upon the high seas and coast waters; yet the old Regulations of 1864 continue in force as to harbours, bays, and inland waters. Let me state here a curious thing, which I was telling Delegate Hall about the other night; it is a curious circumstance resulting from the differences in the Code. I think that, in the Regulations of Great Britain of 1863, there was no provision for a stern light. Congress, some time later, I think in March of 1871, passed an Act providing that there should be a light shown by a sailing-vessel to an approaching steamer upon any point or quarter upon which the vessel was approaching.

The Delegates will see at once that the new Regulation provided for showing a light to an overtaking vessel only in inland waters; but as to the high seas that Rule was not in force. In other words, a vessel proceeding from the harbour of New York, bound for sea, if she were in the harbour, bay, or inland water of the United States, was governed by the new Rule, and was required to show a light to an approaching steamer; but when she crossed that imaginary line which divides the harbour or bay of New York from the great sea, she was to follow the laws of Great Britain, and was not bound to show from her stern a white light or a flare-up light. Of course that is utter absurdity; but I have given this as a suggestion that you, gentlemen of the other Powers, may see where you can find our legislation, and wherein it differs from the English legislation, that you may know the difficulties under which we labour in this country. I do not quite comprehend the force and effect of the Thames Act, as to whether it is limited to the Thames River, or whether it covers the internal waters of Great Britain; but here we have one system of Rules for internal waters and one system of Rules for the sea and coast.

Mr. Hall (Great Britain).—Mr. President, I hope I shall not be wasting the time of the Conference if I make a few observations on what has fallen from the learned Delegate of the United States. In 1862, after arrangements and negotiations had taken place between England and France, these two countries agreed to Rules which were adopted by England in the shape of an Act of Parliament in 1862. These were the first International Regulations. They came into force in the year 1863, and by the month of May 1886 a very large number of the Powers adopted them. Among them I find they were adopted by the United States. I should state that in these Rules, although it is true there was no Rule as to a light being shown to an overtaking vessel, there was a Rule that the overtaking vessel was to keep out of the way of the vessel she was overtaking. Now, the learned Delegate for the United States has referred here to local Rules. It is true that it is sometimes difficult for an officer in charge of a vessel, unless he is well posted in his information and knowledge, to know how far his actions should be governed by local Rules, and how far by the Rules at Sea; but in all cases in our inland waters the scope, or rather the *locus*, in which these local Rules are to apply is laid down. I am speaking from memory only, but I think I am correct. The Thames Rules apply not only to the whole port of London, but to the whole of the River Thames down to a fixed point, which is laid down, so that an officer in charge, if he has a copy of the Thames Rules, has only to refer to his chart to see whether or not he is at sea, or whether he is within the waters prescribed for by the Thames Regulations. Many members of the Conference are aware that we have local Rules for a great many of the rivers and inland waters, and of course within these waters those Rules apply.

Captain Malmberg (Sweden).—Mr. President, I understand perfectly well what the learned Delegate says, but we have, in a good many parts of the world, waters where traffic is kept up by sea-going vessels or by coasting steamers. I may take, for example, the Sound, between Denmark and Sweden. There is an immense traffic kept up by small steamers that do not go to sea at all, and if these Rules only apply to sea-going steamers, those steamers keeping up the traffic between these respective countries should be excepted from complying with the International Rules laid down. As I understand it, they only apply to steamers at sea; but the sea is not exactly the high sea. In Sweden we have a large expanse of coast, from 60 to 70 or 80 miles, and every vessel coming from the sea there is a coasting vessel. That coasting vessel would not be obliged to follow the International Rules. I think that is a great mistake, and that every vessel which meets any sea-going vessel should carry lights, and have Regulations of the same description as the sea-going vessels. That is the reason why I want the word "sea-going" taken out, and have the Rule applied to all steamers in every country. Any country which has inland waters and rivers will have to provide special Rules for such navigation.

The President.—There is a Resolution before the Conference.

Mr. Goodrich (United States).—Mr. President, it is of that Resolution I am going to speak.

The President.—The Delegate from the United States.

Mr. Goodrich (United States).—Mr. President, I believe, so far as I know myself, that I am

heartily in favour of one system of lights for sea and inland navigation, and that, I take it, is within the power of this Conference, within the *ad referendum* of this Conference. Of course we are only acting here subject to the adoption of our action by Government and Government. If this Conference recommend the proposition of the gallant Delegate from Sweden, then it will become the subject for the action of each Government, and if it were unanimously adopted by this Conference I have no doubt it would be unanimously adopted by all the Governments represented in the Conference. I see no reason, perhaps by reason of my inexperience in nautical matters, why there should not be the same lights for a steam-boat or steam-ship of any kind proceeding upon the sea when proceeding upon inland waters. Sailors, as we all know, want very few rules; the gentlemen who represented the Board of Trade of Great Britain attempted to impress upon the sailors in some poetic language something which would fix their minds upon the great Rules of the Sea. Now, I do not see why it should not be arranged that inland waters and sea waters should be governed by the same Rules, so far as they can. I do not lay down absolutely that in all these Regulations the same system should apply to both sea and inland vessels; but in the system of lights, let the eye of the man on the look-out be educated to know that a white light, for instance, means an anchor light, and a white masthead-light with two coloured lights means a steamer or steam-vessel, a steam-boat, something under steam, and I think we have simplified the situation a great deal. By and by we will discuss this question of the lights on smaller boats; but it seems to me that we should wipe out, so far as we can, the distinction between sea-going and inland-going vessels. For the present I am very heartily in accord with the gentleman from Sweden.

Mr. Flood (Norway).—Mr. President, I am fully in accord with the amendment proposed by Mr. Goodrich. I would only propose that the amendment should be extended to all waters connected with the sea by natural or artificial means.

The President.—Does the Delegate from Norway propose that as an amendment to the Resolution of the Delegate from Sweden?

Mr. Flood (Norway).—Mr. President, I would only mention that as a subject for discussion.

Mr. Hall (Great Britain).—Mr. President, I would simply point out to the Conference that it would be a very serious thing if we should attempt to pass a Rule, or if we were to pass a Rule, which would result in altering the whole of the local Rules in all countries; and there would also be this difficulty: For instance, some of our launches do not carry side-lights while they are within the inland waters, and you might have a steam-vessel which navigated the River Thames 10 or 15 miles above London which would be affected by such general Rules as have been foreshadowed. That, of course, I do not suppose would be within the intention of any of the members of this Conference; but, of course, it will be very important to consider whether or not we should discuss Rules other than Rules for use at sea. That, of course, is the main question for us to consider here. If we branch off from that, or endeavour to incorporate with them Rules which are to affect all the inland waters, it would require our very serious consideration to know how it would affect each individual country and each individual port within the country.

Mr. Goodrich (United States).—Mr. President, will Delegate Hall permit me to make a suggestion in that regard? No one supposes that we can legislate for Great Britain, nor that Great Britain can legislate for the United States; but a nation in accepting these Rules that we make, if applicable to all vessels—that is, to all vessels in all waters connected with the sea—may except its own country from the operation of the Act. I assume that a collision occurring in waters belonging to the country excepted from the Rule would be tried according to the Rules in force in that country. In other words, that if Great Britain should except the Thames from the operation of this Act, within the limits already prescribed for the Thames local Regulations, if a collision were to occur there and the trial were to be held in the United States, our Court would be governed by the local law. That is a matter entirely within the power of any country to provide for itself as regards the internal waters. I still, for the present, am inclined to believe that it would be wise to make these laws general, so that a nation in adopting them might adopt them for application on the sea, and for inland waters as well, if they saw fit. Of course, you may state the facts another way; that there is another remedy which will accomplish the same thing, and that we could make those sea-going Rules in the United States, and adopt them for the internal navigation. But I then go back to what I tried to suggest early in the Conference, and to the point in regard to which I am trying to express my judgment, as to the importance of this Conference to make laws for the whole world and upon every water upon which a boat can float, and let nation after nation accept as it chooses.

The President.—I desire to announce to the members of the Conference that the President of the Metropolitan Club has asked me to notify the Conference that the members of the Conference will be considered as members of the Club during the time this Conference shall be in session.

The Conference thereupon took a recess until 2 o'clock.

After Recess.

Mr. Goodrich (United States).—Mr. President, the Conference was adjourned so promptly this morning after the communication of the offer of the Metropolitan Club, that I did not have an opportunity of procuring a vote, which I desire now to procure. I desire to present this Resolution:—

"That the thanks of the Conference and of its individual members be tendered to the President and Governors of the Metropolitan Club for their courteous offer of the hospitalities of the Club during the session of the Conference, and that the Secretary transmit a copy of this Resolution to the President of the Club."

The Resolution was read by the Secretary, and adopted.

Mr. Goodrich (United States).—Mr. President, I desire to present one other Resolution :—

"*Resolved.*—That the President shall have power at any time, and from time to time, to name a Delegate to preside during his absence."

The Resolution was read by the Secretary, and adopted.

The President.—Article 3 is now before the Conference for further consideration.

Dr. Sieveking (Germany).—Mr. President, will you allow me to say a word upon a subject before proceeding to further discussion or to the discussion of Article 3? It has been mentioned here that it would be advisable to strike out the word "sea-going," printed in Article 3. Now I beg to say, for the information of the Conference, in the beginning, that in the German Rules the word "sea-going" is omitted. German Article No. 3 commences, "A steam-vessel or steam-ship," not a sea-going steam-vessel. There is a difference between the wording of the British Rules and the wording of the German Rules; and, so far as I understand, the Swedish Rules also. Of course it must be considered whether the word "sea-going" is to be retained or omitted in the International Rules. First of all, I beg to call your attention to Article 25 of the present Rules, where it is said:—

"Nothing in these Rules shall interfere with the operation of a special Rule, duly made by local authority, relative to the navigation of any harbour, river, or inland navigation."

So the Rules, as they stand, are these: Every local authority, every territorial Legislature, is authorized to make special Rules, different from these International Rules, for the navigation of inland waters. But so far as such local Rules do not exist, the International Rules would apply. That is said in the preliminary introduction to our German Rules, where it is stated that these Rules apply to the sea and to the waters connected with the sea, where sea-going vessels ply. Therefore, our German Rules are these, unless there are local or territorial Rules different from the International Rules, all vessels, whether sea-going vessels or not, must conform to these Rules not only on the sea, but also on the waters connected with the sea where there are sea-going vessels. Now, I should be very much obliged if I could be informed what the precise meaning of the word "sea-going" is, because I am not so conversant with this language as to be certain about it. I should think that there might possibly be two different interpretations of the words "sea-going vessels." A sea-going vessel could be taken to mean a vessel which actually is navigating or plying on the sea, so that it would apply to vessels of every description as soon as they are plying on the sea, navigating on the sea, or "sea-going;" that is to say, actually being on the sea. If I correctly understood Mr. Hall, that was his meaning. But I think that another interpretation could be made of it, although I am subject to information from gentlemen who are cognizant of the English language. Another interpretation could be that a sea-going vessel means a vessel whose habitual business it is to navigate upon the sea; so that it means not only a vessel when on the sea, but possibly also a vessel actually on a river.

Now, as I take it from the hint that Mr. Hall has just given me, the first interpretation is the correct one. If we retain these words, "sea-going steam-ship," the consequence would be that sea-going would mean a vessel which is actually on the sea, whether it be a vessel which is generally destined to trade on the sea or to trade on the river only. A steam-ship on the sea would be subject to these Rules, but no other vessel except a steam-ship, when on the sea, would be subject to them. The consequence would be that a large ocean trader, as soon as she left the sea and proceeded up the river, would not be subject to these Rules. There would be no Rules at all, no International Rules, but there would be a possibility of giving local Rules. If no local Rules were given there would be no law for a large ocean trader as soon as she left the sea and proceeded up the river. That would be the system of the English Rules; whilst the system of the German and Swedish Rules would be that every steamer on the high seas, as well as on a river, must carry these lights, subject to exceptions which may be introduced by local Rules. In comparing these systems with one another, my opinion personally is, that it would be much better to frame the Rules so that they would apply not only to vessels which in their general destination are required to carry on their trade on the sea, "sea-going vessels," in this meaning of the word, but also to all other vessels, whether being on the sea or on territorial waters subject always to Article 25, which allows the local Legislatures to establish certain Rules in territorial waters.

Mr. Hall (Great Britain).—Mr. President, I think the learned Delegate from Germany has misunderstood what I wished to hint to him, viz., that sea-going vessels would include a vessel bound from any port to sea or bound inward from the sea. The moment she is bound outward or the moment she is on the sea and bound inward, she would be a sea-going vessel, and she would be bound by the Rules of the Sea, unless there are local Rules which are at variance with them. In that case she would be governed by local Rules as soon as she came within the scope of their operation. A vessel would be a sea-going vessel if she were bound out to the sea or if she were coming in from the sea.

Dr. Sieveking (Germany).—Mr. President, if that is the meaning of "sea-going vessels," all vessels which are bound from port to port, which have to cross the sea, are sea-going vessels; whether they go out of the port or come into it, they are sea-going vessels. Then, if the words "sea-going steamers" are taken in this sense, and the word "sea-going" is inserted, there would be no Rules for the small craft or for the inland-water vessels—inland-water steamers which ply on the rivers only—unless there was local legislation. Now, a vessel coming from the ocean and proceeding up a river, if the German Rules or the Swedish Rules are in force, would know that all steamers, whether they are sea-going in this sense or not, are subject to these Rules, unless there are local Rules to the contrary. That, so far as I see, would give greater certainty and greater safety, for it would establish as a general rule that all steamers which may be sea-going steamers on their way to port are subject to these Rules; and would make it an exception only if the local authorities thought it necessary on account

of the peculiar circumstances of the territorial waters. It is my impression that it would be very proper to strike out the word "sea-going," so that as a general rule all steam-ships carry these lights; and then to leave it as it is in Article 25, for the local authorities to provide for exceptions.

Captain Lanneluc (France) thereupon addressed the Conference in French, which was not reported.

Captain Van Steyn (the Netherlands).—Mr. President, I quite agree with the reasons mentioned by former speakers about the word "sea-going," and suggest other alterations to be made. No definite place has been assigned for the side-lights, and as on board of sailing-vessels those lights ought to be placed in such a way that they cannot be intercepted by the sails or boats (that is to say, in front of the foremast), every vessel, whether a steamer or a sailing-vessel, ought to have the side-lights carried there.

In regard to the visibility, I would point out the fact that at the time the greatest speed of a vessel did not exceed 12 knots, a visibility of 2 miles was deemed sufficient; now that steamers are going at a rate of 20 knots, a side-light ought to be seen at least 3 miles.

Captain Salvesen (Norway).—Mr. President, I would like to move, if it is in order, to strike out the word "sea-going."

Mr. Flood (Norway).—Mr. President, before going any further with this discussion, allow me to suggest that possibly there should be some interpreter here who would give us a brief résumé of what was said in French in regard to this matter. I am sorry to say that I am unable to follow the honourable Delegate from France, who has just delivered, no doubt, a very interesting speech, and if there was an interpreter here who would give us a résumé of that, it would be a great advantage to us who do not speak the language.

The President.—There will be a French stenographer here to-morrow, who will also be an interpreter, and he will interpret any remarks which may be made in French into English, or English into French.

Mr. Flood (Norway).—Mr. President, I refer especially to the French language.

The President.—After to-day I hope we will be able to interpret everything which is said in the French language. To-day it is difficult, because our interpreter has not yet arrived. He was expected here this morning, but he missed his train, and therefore we are in the present difficulty.

Mr. Hall (Great Britain).—Mr. President, I understand that a proposal has been made with regard to leaving out the word "sea-going." I understand that this proposition will be printed, with all of the proposed amendments which will be presented to us, and will come to a determination, to-morrow being Friday, on Monday morning, so that I shall have time to consider it.

The President.—I understand that that proposition is laid on the table, to be ready for further consideration. The Conference is not prepared to consider the subject at the present time.

Mr. Hall (Great Britain).—Mr. President, I understood that that was so. Perhaps I shall be in order in giving notice of an addition which I propose, on behalf of my colleagues and myself, to submit to the Conference in regard to subsection (*a*) of Article 3. It is this:—

"A ship without a foremast shall carry this light in the fore part of the ship, at a height above the hull not less than the breadth of the ship, except in a ship the breadth of which exceeds 40 feet, in which case the light need not be carried at a greater height above the hull than 40 feet."

Now, perhaps I had better state the object of this to the Conference. It is to meet the case of modern men-of-war and other vessels which are being built now, in many cases, without any foremast at all; and in some cases these vessels are being built of a breadth considerably exceeding 40 feet. These vessels would have to erect a mast sometimes 60 or 70 feet high in order to comply with the requirements of the existing Rule, which says that the masthead-light, if the breadth of the ship exceeds 20 feet, should be at a height above the hull not less than such breadth. But we think that 40 feet is high enough for the foremasthead-light for any vessel, and that in the case of a vessel like a man-of-war it is not necessary to place upon her the onus of having to build a mast as high as her own breadth. We think that if she puts up a mast 40 feet high and exhibits such a light that will be sufficient. It is only to meet the requirements of the modern construction of vessels. I beg to give notice of this, which, of course, will be printed with the other amendments.

The President.—It will be printed with the other amendments and submitted at some future time.

Article 3 is still under consideration.

Captain Mensing (Germany).—Mr. President, I would like to mention that the German Delegates are all of the opinion that the proposition made by Captain Van Steyn is one of which we heartily approve. We believe that something should be done to better show the course of ships, and we believe that it is necessary to do it, if it can be done, in a simple and efficient way. We intend bringing here a proposition, and moving that it be adopted by this Conference, that the side-lights of the ship shall not be altered in their colour or in any other way, except, perhaps, to make a better standard from that which is adopted now in the way of candle-power of the light.

You are fully aware that I may now place my side-light either near the bow or very near the stern. We think this is wrong, and that it might be remedied so that the position of the side-light and the position of the white masthead-light of the steamer should give an indication of the course. We believe it would be best to place the side-light further aft than the top-light of the vessel; that is to say, that the line which connects the side-light with the point perpendicular to the top-light should form with the line of the keel an angle of less than 90 degrees. I am not in a position to make any definite proposals now, because it has been impossible to frame them in such a manner that we could bring them to the notice of this Conference; but I hope we shall be able to do so. I beg leave to offer this and to have it printed. To save time I think that we might bring in a proposition agreeing with the idea expressed by Captain Van Steyn, in regard to fixing the unit for the power of the light. We have had our experiments made in Germany, whereby we have found that the very worst lights

we could possibly buy anywhere could be seen on a dark clear night 5½ kilom. We all know from experience that these lights now are very often not strong enough to be seen at a distance of 2 miles. I think that altogether it would be the better mode of proceeding to refer this power to some standard that is used all over the world. I am not in a position now to make any definite proposal. I only hope that you will permit us to make a proposition and hand it to you to-morrow.

Captain Sampson (United States).—Mr. President, I think it would probably facilitate our work if the members of each Delegation should submit to the Secretary in writing any propositions for altering or modifying the present Rules of the Road, so that we could have them for our consideration at the earliest possible time. We are now all assembled here for the first time without being acquainted with each other, or with the propositions which are to be brought forward. Of course, they come to many of us as entirely new; and they may be entirely unexpected. If these propositions could be printed and laid before the Conference at once, I think it would facilitate our work very much, and give us an opportunity of making up our minds and enabling us to express an opinion on these different subjects whenever they are brought up. I therefore make the motion, Mr. President, that any Delegate is at liberty to submit to be printed any proposition which he may have to make, looking to the modification or change of the present Rules of the Road.

Mr. Hall (Great Britain).—Mr. President, with regard to the proposition contained in the Resolution moved by Captain Sampson, I may say that we are thoroughly in accord with it. I think it is very desirable that we should all know as soon as possible what suggestions will be made and can be made by the united assistance of the Delegates who have considered these questions. It will certainly assist us all if we can see not only the suggestions of individual Delegations, but if we can see them side by side and compare them, and then arrive at determinations in our own mind as to whether or not we think we ought to vote in their favour. Speaking for my brother colleagues and myself, I shall be very pleased at the earliest possible moment to give the Conference the whole of the suggestions which we think are worthy of discussion. We will hand them in, and we shall hope to see them side by side with the proposals of other Delegates. I only want to state this, that in handing in these proposals we do not bind ourselves to vote for them wholly or in part. We make the proposals in consequence of very careful discussion which we have had in Great Britain. I may say that we have had a very strong Committee sitting for a very considerable time, in which we have gone very carefully through these Rules, and we have thought it right to embody the suggestions made to us, and which we think worthy of consideration. We will present them to the members of the Conference, so that the members can discuss them and see whether or not they see fit to adopt them either wholly or in part.

The President.—As that is rather an important Resolution, will you be kind enough to reduce it to writing so that the Conference may understand it thoroughly?

Mr. Verney (Siam).—Mr. President, I presume, Sir, that this does not exclude other Resolutions which may arise subsequently?

The President.—No, Sir; it is simply to bring the matter before the Conference?

Mr. Hall (Great Britain).—Mr. President, perhaps before Lieutenant Cottman reads the Resolution, I may say that in order to assist the members of the Conference in their deliberations, we have had prepared in Great Britain the old Rules, or rather the present Rules side by side with the Rules, with such additions thereto as we think worthy of discussion. I have given instructions that there should be copies provided, which we will present to the various Delegations, because it will save them infinite time and trouble in collating the results. I will take care that they shall be distributed at as early a moment as possible. We have only a few at present, but will take care that others shall be printed and distributed as soon as possible.

Mr. Goodrich (United States).—Mr. President, following the line of Delegate Hall's statement, that while the propositions may be presented by the English Delegates, they do not bind themselves to urge them or vote for them, I present also another proposition, as to the propriety of which I am not altogether clear. Of course, the gentlemen present must know that Delegate Hall and myself are mere theoretical sailors. We have gathered what knowledge, or at least I have gathered what knowledge I have on the subject, from investigation, after collisions, in the Courts. There is a Rule, however, which is in force on the inland waters of the United States; I have not the text of it here. But I give notice, now, for the purpose of having it printed—a proposition to add an additional white light on a moving steam-vessel in the night, a range-light; for instance, a light farther forward than the foremasthead-light. I believe the rule is at an angle 55 degrees, and the same distance below the foremast light; so that, as a steam-vessel alters her course, the after-light opens and forms a range. I believe it is a fact that the angle between the vertical lines in the said light and the line of the after range-light, as it opens, coincides with the angle of the vessel's altered course. I will give notice of that proposition, so that it may be printed for discussion.

The President.—The Resolution offered by Captain Sampson, Delegate from the United States, will now be read by the Secretary.

The Resolution was read by the Secretary, as follows:—

"*Resolved*,—That the members of the Conference are invited to submit to the Secretary any suggestions which they may desire to bring before the Conference bearing upon the subject now under discussion—the Rules of the Road. The suggestions to be printed for the information of the Delegates."

The Resolution was put by the President, and unanimously adopted.

The President.—I wish to state that a great many propositions have been presented to the American Delegates, which are too numerous to be distributed, and many of them are too voluminous to be printed and laid on the table for the Delegates. They will be produced here and be read, if necessary, to the Delegates before consideration. It would be the making of volumes to have them all printed, and I do not think it would be at all necessary.

Mr. Goodrich (United States).—Mr. President, right in the line of your thoughts I will offer the following Resolution :—

"*Resolved*,—That the Chair appoint two Committees, to consist of seven Delegates, to be known as the Committee on Lights and the Committee on Sound-Signals, whose present duty it shall be to examine and report to the Conference the literature on these two subjects which is in the possession of the Conference."

The President.—That seems to be the only way of bringing the subject properly before the Conference.

Mr. Hall (Great Britain).—Mr. President, upon that Resolution I will make one observation. These Committees will be able to spare us labour in that they will only present to the Conference such part of the literary productions as they may deem proper, and spare us the labour of examining the whole of the productions which I know have come in a deluge upon the Conference.

The President.—The Chair considers that the spirit of the Resolution is that the Committees digest all of the literature that comes before them, and submit such as in their opinion is important. The Secretary will please read the Resolution.

The Resolution is as follows :—

"*Resolved*,—That the Chair appoint two Committees, each consisting of seven Delegates, to be known as Committee on Lights and Committee on Sound-Signals, whose first duty it shall be to examine and report to the Conference the literature on these two subjects which is in the possession of the Conference."

The Resolution was carried by the Conference.

The President.—There would seem to be no further business to be transacted until these Committees are appointed.

Mr. Hall (Great Britain).—Mr. President, might I venture to make one suggestion with regard to the course of business on Monday, and that is that the amendments, notices of which been handed in, should be taken up in the order in which they bear upon the Rules? I think it will save time if we do so, and it will be more in order if the Secretary will please put them in the order in which they come. Then we shall not have to hark back, if I may say so, from one amendment to another.

The President.—The Chair is of opinion that the Resolution just passed was intended to relieve the Conference of the present discussion of these subjects.

Mr. Goodrich (United States).—Mr. President, perhaps I have not made myself understood in the Resolution, which I drew somewhat hastily. I did not intend by the Resolution to convey the idea that that was to stop discussion upon the subject. It was only that such a Committee might examine all the literature which is in the possession of the Conference, including the Reports of the United States' Government upon various subjects, which I think the Chair requested to have examined during the interval of our sessions, and which are here. But I do not see why that should preclude us from going into the discussion of the Rules.

The President.—It occurred to me that it would be doing double work.

Mr. Goodrich (United States).—Mr. President, it may be that I am entirely in the wrong, but my intention was to have the Committees examine the literature alone, and not formulate any propositions upon it.

The President.—The Chair understood that they were to digest it and produce the best results they could. Otherwise they would have to present each case to the Conference, which would make its work interminable. Will Mr. Hall be kind enough to put his proposition in writing, with reference to the proceedings on Monday?

Mr. Hall (Great Britain).—Mr. President, I did not intend to put a motion, or to suggest any particular day. It was more with regard to the conduct of the proceedings, and with the idea that it would be more convenient if the amendments, which are not all of them consecutive, could be so placed on the paper in consecutive order that we could take them up in order. I do not propose for one moment to suggest to you any particular day when they should be taken up. Of course I leave that in your hands. Mr. President, I moved that when they came up they would come up in the order in which they would naturally apply to the Rules.

The President.—Pending any further business, I am requested to ask the Delegates to be kind enough to leave their cards at the door with their addresses on them. It will save the Secretary a good deal of trouble.

Mr. Goodrich (United States).—Mr. President, I do not know whether any other member of the Conference has any further suggestion to make about Article 3. The work thus far has been of very great importance, and I venture to suggest that it might be a good plan for the Secretary to read the next Article, so that the same suggestions, or similar ones already offered in regard to Article 3, may be thrown out in regard to Article 4. It is very evident that if we carefully discuss to-morrow and Monday the provisions of Article 3, we shall have our day well occupied. Then, if the suggestions about Articles 4, 5, and 6 can be made, we can have them a little in advance, and among ourselves be prepared to consider them.

The President.—If there be no further suggestion in regard to Article 3, the Secretary will please read Article 4.

Article 4 is as follows :—

"Article 4. A steam-ship when towing another ship shall, in addition to her side-lights, carry two bright lights in a vertical line, one over the other, not less than 3 feet apart, so as to distinguish her from other steam-ships. Each of these lights shall be of the same construction and character, and

shall be carried in the same position, as the white light which other steam-ships are required to carry.

Mr. Hall (Great Britain).—Mr. President, I have an amendment to suggest with regard to Article 4, and that is in the fourth line of Article 4, or perhaps we have not all copies printed in the same way; it will be better to follow the copy which is issued by your Treasury Department. In the third line, to substitute the word "six" for the word "three." We have thought, on the whole, after hearing opinions on the point, that it made a better distinction to have them 6 feet apart than 3 feet apart. I may say that this 6 feet has been adopted elsewhere, and we thought it might be less complicated to adopt, where we could, the same distances.

The President.—It is proposed by the Delegate from Great Britain to substitute for the word "three," in line three of Article 4, the word "six."

Mr. Goodrich (United States).—Mr. President, I do not know whether this position is practicable, but I know that some dispute has arisen on the subject, and it has been under consideration by the Courts of New York, and I have suggested an amendment to add apt words to define the position on the vessel of the two vertical lights. There was a discussion some years ago (I cannot recall the case at the moment) as to whether these two vertical lights on a towing-vessel should be on the after-flagstaff——

At the suggestion of my friend, I will withdraw that proposition for the present.

Captain Van Steyn (the Netherlands).—Mr. President, I want to support the proposition made by the learned Delegate from Great Britain to change the word "three" to the word "six." But it may be that there is not to be found on every vessel a distance of 6 feet. I think that it should be worded in this way: "If possible, not less than 6 feet."

The President.—Mr. Hall, do you accept that amendment?

Mr. Hall (Great Britain).—Yes, Sir.

Dr. Sieveking (Germany).—Mr. President, I think there is an omission in the Rule. There is nothing said about a sailing-ship when towing another vessel. That may be a very rare occurrence, but still it occurs, and it should be considered whether certain lights should not be prescribed for sailing-vessels when towing. Sailing-vessels, in case they tow other ships, are in a peculiar situation, because their manœuvring is more difficult than the manœuvring of steam-vessels. Perhaps it might be worth while to consider whether Rules should not be prescribed, together with the Rule saying that all vessels are to keep out of the way of sailing-vessels which are towing other vessels. I only mention it to call the attention of the Conference to it, because perhaps we may have an opportunity of calling their attention to it in the shape of a motion.

Mr. Goodrich (United States).—Mr. President, after consultation with some of my colleagues, I will give notice of this amendment, to add "apt words to define more carefully the position on the vessel of the two vertical lights."

The President.—The Secretary had better read the amendment.

Mr. Goodrich (United States).—Mr. President, perhaps I had better read it, as it is in the lawyer's handwriting. In Article 4 (*d*), "Apt words to define more carefully the position on a vessel of the two vertical lights." I will call attention to the suggestion I am making. When I first suggested it I referred, as I said before, to the fact that what we called tug-boats in the harbour of New York, which is navigable water, carry, when towing, on the flagstaff, two vertical lights. That has been the subject of judicial inquiry in the Courts of New York. This Article 4 provides for a steam-ship at sea, evidently, from the language of the Act, which is, "A steam-ship, when towing another ship, shall, in addition to the side-lights, carry two bright white lights in a vertical line, one over the other, not less than 3 feet apart, so as to distinguish her from other steam-ships: each of these lights shall be of the same construction and character, and shall be carried in the same position, as the white lights which other steam-ships are required to carry." The same position would prevent their being just aft, in a vertical line.

Mr. Hall (Great Britain).—Mr. President, let me point this out to the Delegates of the United States in defence of our phraseology. The position of the masthead-light is at a height of not less than 20 feet, and if these two lights are both not less than 20 feet, they are in the position, which is the sole position, defined in Article 3, subsection (*a*). They both comply with subsection (*a*), Article 3, if they are both 20 feet; but so long as the lower one is not less than 20 feet, the one above it can not be less than 20 feet.

Mr. Goodrich (United States).—Mr. President, it would not be in the same position.

The President.—If there be no further suggestion upon Article 4 the Conference will proceed to the consideration of Article 5.

Mr. Goodrich (United States).—Mr. President, two or three gentlemen in my immediate vicinity suggest that we have enough to keep our thoughts occupied, at least until to-morrow morning. I notice that Article 5 is very long, and the subjects are somewhat different from those we have been considering. If there is no further business before the Conference I am going to make a motion to adjourn, unless some gentleman has something which he desires to say.

I move that the Conference adjourn.

The Conference therefore adjourned until Friday, at 10 o'clock A.M.

Washington, Friday, October 18, 1889, 10 *o'clock* A.M.

THE Conference was called to order at 10 o'clock A.M., Rear-Admiral Franklin in the Chair.

The President.—The Chair desires to state that the Protocol, although ready, has not been revised by the Secretary, and the Secretary would prefer not having it read until Monday, if there be no objection.

Mr. Hall (Great Britain).—Mr. President, perhaps you will allow me to state, for the convenience of the Delegates, Mr. Spring Rice will give printed copies of the suggestions that we shall have the honour to make to the Conference. I regret very much that at present we have not enough copies to give one to each Delegate. We will hand one copy to each Delegation. Then perhaps they may think it desirable that we should have some copies printed for the use of individual members.

Mr. Goodrich (United States).—Mr. President, in that connection I move that the Secretary have printed extra copies of the suggestions handed in by the English Delegates. I do not think it is quite proper that they should bear the expense of printing documents for the use of the Conference. How many do you think, Mr. Hall, would be desirable?

Mr. Hall (Great Britain).—Mr. President, I think that we have about five and twenty copies at present. I think if there were fifty copies printed that would provide a copy for each Delegate.

Mr. Goodrich (United States).—Mr. President, I move, then, that the Secretary be instructed to print 200 copies of these propositions.

The President.—If there be no objection that will be done.

Mr. Goodrich (United States).—Mr. President, before we resume the regular order of business, I have a motion to make for a Committee. I asked the Conference yesterday to pass a Resolution for the printing of the Rules of the Road, as adopted by Great Britain, with a Memorandum showing the changes made by the United States. That is a task which must be very carefully done, and the papers which I supposed were in possession of the Conference do not exactly meet the necessity of the case. I move, therefore, that a Committee of three be appointed for the purpose of conducting that work; and I should say that, as I am going to leave the City this afternoon, and this work will need to be done to-day or this evening, I should be very much obliged if the Chairman would not name me as a member of this Committee.

The President.—Mr. Goodrich will be kind enough to write out the Resolution.

Mr. Goodrich (United States).—Mr. President, I will draw the Resolution; that will be better.

Mr. Hall (Great Britain).—Mr. President, perhaps you will permit me to say that in the copies which are now to be handed out there are a few verbal inaccuracies which I will see afterward, before the proof is handed in to the printer for the first copy, shall be corrected. The Delegations may like to have such materials as we have, although it is not absolutely correct in every word. Then they will know what propositions we intend to make, with one or two slight verbal alterations.

The Secretary then read the motion of Delegate Goodrich, as follows:—

"That a Committee of three be appointed to prepare the material for printing the International Rules of the Road as ordered on Thursday, the 17th, together with any other Memoranda of changes in the law of other Powers than the United States."

Mr. Goodrich (United States).—Mr. President, the object of that last clause is that if the Delegation from any other nation than Great Britain or the United States should desire to set out in the Memorandum at the foot of each Article the changes in their own law from what we have made the basis of a common comparison, that is, the English Statutes, they can hand them to the Committee during the day. That will facilitate matters very much.

The motion was put to the Conference, and carried.

The President.—When the Conference adjourned last evening, we reached Article 5 in the general discussion of the Rules of the Road. The Chair is ready to hear any suggestions in regard to Article 5.

Mr. Hall (Great Britain).—Mr. President, I have an amendment to propose to Article 5, subsection (*a*), and that is that the number of red lights to be carried by vessels at night should be two red lights instead of three, and that the distances which they are to be apart should be not less than 6 feet instead of 3 feet, and that by daytime they shall carry two black balls instead of three black balls, and that they should be 6 feet apart instead of 3 feet apart.

The President.—If I understand correctly, the Delegate from Great Britain desires that that shall be printed as presented.

Mr. Hall (Great Britain).—Mr. President, I may say that all of the suggestions which I shall have the honour to make will be printed, and that will assist the Secretary in arriving at the amendments which are proposed by my colleagues and myself.

Captain Malmberg (Sweden).—Mr. President, I suggest that in subdivision (*b*) of Article 5, which reads now: "A ship, whether a steam-ship or sailing-ship, employed in laying or in picking up a telegraph cable," there should be inserted here, "or occupied by hydrographical researches, such as sounding, dredging, &c., shall at night carry the same lights which are mentioned in that paragraph."

The reason for my suggestion is that I have had some experience, perhaps a great deal of experience, in surveying out at sea, and there was many a time, especially at night, when my ship was on the point of being run down because I had no signals to indicate that the ship was not under command. You will say that subdivision (*a*) of Article 5 covers this point; but that is not quite exact, because, although a ship surveying or taking soundings or dredging, at the moment of operation is not under command, you may, in case of impending danger, get your engines started or make sail on the ship. I think it is quite appropriate to hoist a signal to show that the ship is not under command, and that is the reason I wish to have this addition made to subdivision (*b*).

The President.—The Secretary will please read this amendment.

The Secretary thereupon read the amendment as follows:—

"Article 5. (*b.*) A ship . . . . picking up a telegraph cable, or occupied with hydrographical researches, such as sounding, dredging, &c., shall at night carry . . . ."

The President.—The amendment will be printed for the consideration of the Conference.

Captain Malmberg (Sweden).—Mr. President, there is another thing in this paragraph, Article 5, which comes into my mind just now. There is, in these Regulations, nothing at all said about what lanterns a sailing-vessel is to carry when such a ship is towing. It says in Article 6 that "a sailing-ship under way or being towed shall carry the same lights as are provided by Article 3 for a steam-ship under way, with the exception of the white light, which she shall never carry." This says that a steamer under sail alone shall carry the same lanterns as a sailing-vessel which is being towed or under way. I do not think that quite appropriate, because a sailing-vessel under tow or a steamer under tow is not under command, and that is the reason why I would suggest that a ship under tow ought to carry the same signals as required in Article 5, subdivision (*a*). To me it seems rather strange that a vessel not under command, which a ship under tow is not, should carry lights of the same description as a sailing-vessel under command. With a vessel under tow, with a long tow-rope attached to her, on a dark night, there is nothing to tell you of that fact. You see a ship and a green lantern or a red lantern, but there is nothing to tell you that that ship is under tow if you do not see the masthead-light of the tow-boat; but you might come from an opposite quarter or from such a place that you are not able to see the masthead-light of the tow-boat or tug. You may only see the red light, and you may take it for a sail when it is a ship under tow.

Mr. Hall (Great Britain).—Mr. President, I cordially agree with the suggestions which have been thrown out by the gallant Delegate who has just addressed us, as to the desirability, if possible, of having some distinctive light which would show when a sailing-vessel is towing, and if possible, also a distinguishing light to show that the vessel is being towed; but I would venture to suggest that in order to come to a practical result upon that point, it will be necessary to give notice of the proposal as to what the light is to be. I may say this—this subject has not escaped our attention, but the difficulties that we have found have been to devise some signal which will answer the purpose and yet not be misleading. But if the gallant Delegate who has brought this very important matter to the notice of the Conference will endeavour to formulate some proposition with regard to a distinguishing light that shall be carried, we shall then be better able to discuss it than we are now in discussing the abstract question whether or not it is desirable for towing-vessels to show any distinctive lights.

Mr. Goodrich (United States).—Mr. President, my colleague, Captain Shackford, has already had that matter in charge, and has drafted a paper which I will submit presently. But, for the convenience of the Conference, I have a suggestion to make which, I think, if carried out, will save us a great deal of labour in examining the proposed amendment; and this suggestion is in accordance, as Captain Sampson informs me, with the practice of Congress with regard to amendments to the Statutes. I therefore move this Resolution:—

"That all proposed amendments to the Regulations submitted by members shall be presented in writing, containing the whole of the Article or subdivision to be amended, with the matter to be obliterated crossed out, and the amendment in italics, so that the members of the Conference can readily ascertain the new matter."

Mr. Hall (Great Britain).—Mr. President, I would move an amendment to that by inserting, after "in writing," the words "or in print," because we shall be in a position to hand them in in print.

Mr. Goodrich (United States).—I accept the amendment.

The President.—The Resolution will be read in French.

The Resolution was thereupon read to the Conference in French.

The Resolution was thereupon submitted to the Conference and was unanimously adopted.

Mr. Goodrich (United States).—Mr. President, my colleague, Captain Shackford, desires me to present a new thought to the Conference without embodying it in an amendment at present, and that is in connection with Article 5: that, instead of having threered lights in globular lanterns as at present, or two red lights as proposed, there should be three white lanterns; because we want to avoid as much as possible the expense of new equipments, and the three white lanterns, if you should continue to use three, are always useful on board the ship and are always at hand. This is a matter which Captain Shackford desires to have thrown out for the consideration of the Delegates, and he may possibly embody it in an amendment.

The President.—The Secretary informs me that he can get as many copies of these Rules as he wishes, so that it will save trouble in copying, according to the last Resolution, if you should cut out the portion you propose to amend and add the italics. It would take a great deal of time for each Delegate to copy off the separate Articles. The last Resolution provides that in each case when a proposition of such a kind is made the whole must be written out.

Mr. Hall (Great Britain).—Mr. President, I apprehend we shall be conforming to the spirit of that rule if we hand in our propositions in print?

The President.—Entirely so. It is merely to aid the Secretary in formulating his matter.

Mr. Hall (Great Britain).—Mr. President, I have a further amendment to propose under sub-section (*d*) of Article 5. I propose to insert these words in lieu of the last sentence. In subsection (*d*) the last section is: "The signals to be made by ships in distress and requiring assistance are contained in Article 27." We have thought it desirable to point out to seamen that these are not distress signals, and therefore we propose to add to subsection (*d*), in lieu of the words to which

I have just called attention, these words: "These signals are not signals of ships in distress requiring assistance. Such signals are contained in Article 31."

You will see, of course, that under the old Rule it would look rather as if these were signals of distress, by implication; but we want to make it perfectly clear to seamen that they are not distress signals, and that the distress signals will be found elsewhere in the Code.

Captain Van Steyn (the Netherlands).—Mr. President, we desire to lay before the Conference a proposition to omit the words, "each not less than 10 inches in diameter;" and to read, instead of "3 feet," "6 feet;" power to be indicated by candle-power.

As the power of a light does not depend on the size of the lantern, but on the source of the light placed within, provision should only be made regarding its visibility. This remark may also be applied to the following Article, where lanterns of a certain diameter are mentioned. The distance between the lights should be changed to 6 feet; as, according to experiments made by Professor Regnault, lights can only be distinguished as separate from a distance of 2 miles when they are 6 feet apart.

In regard to subsection (*c*), we think that the visibility of a light ought to be prescribed. We wish to lay before the Conference a proposition, whether it is not necessary to give a special signal to steamers under sail without steam and manageable by, say, a triangular shape in the foretop.

I will call attention to the fact that in the Dutch Regulations the visibility has been mentioned, and it has not been mentioned in the French nor in the English text.

The President.—The Chair would suggest that, according to the last Resolution, your amendment should be in writing.

Mr. Goodrich (United States).—Mr. President, if there are no other amendments in regard to Article 5, I have to make a suggestion on the part of my colleagues, going back to Article 4, which is a little out of order. Captain Shackford's proposition is to add, at the end of Article 4, these words in regard to towing ships:—

"A small white light abaft the funnel or after-mast shall be carried for the vessel being towed to steer by."

Captain Shackford (United States).—Mr. President, as a matter of fact, all sailors know that these lights are carried now by all steamers towing.

Mr. Goodrich (United States).—Mr. President, I am also asked to submit this proposition of Captain Norcross, one of my colleagues, as an addition to Article 4:—

"Steam-vessels, when towing other vessels, in addition to the masthead-light and range-light, shall carry an additional masthead-light; if towing more than one vessel, another light for each vessel shall be added, which lights shall not be placed less than 3 feet apart."

This is important, as tows are now made up half a mile long.

Mr. Verney (Siam).—Mr. President, I beg to propose that if the word "uniform" is maintained ultimately in the 3rd and 4th Articles, that a definition of that word be added to the end of the Article where it is used, so that all may understand what the meaning of that word is as it appears in the Article.

The President.—If there be no further suggestions in regard to Article 5 the Conference will proceed to the consideration of Article 6. The Chair will now hear any suggestions with reference to Article 6.

Mr. Hall (Great Britain).—Mr. President, I have a small verbal alteration to propose, and it is this: At the end of Article 6 members of the Conference will see the words, "with the exception of the white light." There is no definition of that white light, and to make it clear that it is the ordinary white light of a steam-ship we propose to insert that it is the white light mentioned in Article 3, subdivision (*a*), because it will be found that there are other white lights referred to in the Rules, which possibly might be mistaken for this. Therefore, to prevent there being any doubt about that, we propose to add, after the words "white light," the following: "mentioned in Article 3, subsection (*a*)."

Captain Salvesen (Norway).—Mr. President, in this Article a term is used which perhaps has a particularly clear and comprehensive meaning in the English language, but which when translated into other languages is very often not clear; and that is, the term "under way." I should think it very advisable, as all of these Articles and Rules have to be translated into all languages, that there should be an explanation of what "under way" is. According to one view a ship "under way" would mean a ship in motion with speed enough for steering, and yet that is evidently not right, because, if you stop your vessel, you have no motion and you have no speed, but still you are not to take in your side-lights. So, clearly, the term "under way" has another meaning. It would be perhaps advisable that it should be quite clear to all as to what the meaning of the term is. A sailor will know what it is; but when the case comes before a Law Court, the lawyers will perhaps not agree what "under way" is, and give it a different sense than intended. I think it is advisable that it should have an explanation at this time and at no other time. I do not think that any other assembly could give an explanation better than the present. The framers of the Rule ought to know best the meaning of the language and sense of the words employed.

Mr. Goodrich (United States).—Mr. President, in answer to the suggestion of Captain Salvesen, I may say that I have a recollection of the fact that the term "under way" has been the subject of decision by the Courts. I remember one case, although I cannot give the name of it, in which it was held that a vessel getting under way was under way as soon as her anchor was lifted from the bottom. In another case in which I was myself engaged it was held, under Article 12, subsection (*c*), which reads: "A steam-ship and a sailing-ship, when not under way, shall, at intervals of not more

than two minutes, ring the bell"—it was held that a sailing-vessel "hove-to" was not under way, and that she must ring the bell instead of obeying subdivision (*b*) and sounding the fog-horn, "one blast to show that she was on the starboard tack, and two blasts to show that she was on the port tack." There are two distinctions. I remember, as was remarked yesterday, that these Rules are for the guidance of sailors, as well as for construction by the Courts above. I think, with the gallant Delegate, that they should receive an interpretation here, just as the various terms received an interpretation and definition in the Merchant Shipping Act of 1854. I think it would be a very good idea to preface some of these Articles with a distinctive Article as to what certain nautical terms mean, and the construction which the Conference designs shall be put upon them.

Mr. Hall (Great Britain).—Mr. President, I may say that this question has also occupied the attention of our Courts of Law, and we have had the question as to the definition of "under way" discussed in a good many cases of late days. I find that one of our decisions is not quite in accordance with the decision of your Courts, because our decisions come to this: that a vessel which is not actually held fast by moorings or anchors or otherwise is under way. That decision agrees with the law which Delegate Goodrich has mentioned, that a vessel weighing anchor is under way as soon as the anchor leaves the ground. Most of the decisions are in conformity with one another. So, a vessel would be held to be "under way" if she were hove-to. She is "under way," and she is not entitled to ring the bell as if she were at anchor. But I quite agree as to the desirability, if possible, of using some term which will meet the requirements of all languages. "Under way" is a technical term which we use, and we understand it. I must confess that it has taken a good many decisions to make us understand it thoroughly. Of course, we shall be glad if any term can be adopted which will place the matter beyond all doubt and signify what we all mean; and that is, a vessel which is not fastened by moorings or anchors, or otherwise. I quite agree that it would be very desirable to use terms which can be translated into every language without any difficulty.

Dr. Sieveking (Germany).—Mr. President, the German Courts construe the term "under way" in the same way as Mr. Hall has stated the English Courts construe it. Therefore, there is some doubt as to the meaning of the term. I quite agree with what Mr. Hall has said, that it should be taken into consideration by the Conference.

Mr. Goodrich (United States).—I might say, Mr. President, that, believing in the soundness of the English Rules as stated by Delegate Hall, I made a great effort, citing the English cases, to make the Courts believe that the English Rule was correct, but I dismally failed in obtaining that construction. That is another reason suggested by Delegate Hall why it would be well to have a very succinct definition of the terms; and perhaps the learned Delegate used the very best words that could be used, that a vessel not actually fastened to the land is under way.

The President.—Does the Delegate from Norway propose that in the form of an amendment?

Captain Salvesen (Norway).—Mr. President, it was rather the expression of a wish to have certain words explained for the use of those who have to translate these Rules, but I will hand it in as an amendment.

Captain Sampson (United States).—Mr. President, I would suggest that, as these terms are well understood, as applied in this Article by all seafaring men, it probably would be better to give a definition of its meaning and retain the present words. No other words, probably, can be substituted that would so clearly express a ship's condition as the words "under way," because, as has been pointed out by several of the Delegates who have just spoken, a ship that is held fast, either by anchors or being moored to a wharf, or in any other way, would be the reverse of what is expressed by "under way." Therefore, if some proper definition is given to these words it would remove all ambiguity.

Mr. Flood (Norway).—Mr. President, I only want to suggest that instead of the words "under way," which have been discussed, that it might be well to use the words "having headway," or "sternway."

Mr. Hall (Great Britain).—Mr. President, I will point out that that would hardly bring in a vessel in a calm or a vessel drifting with the tide. I may say that the present words were used in our Rules after very great consideration, because we considered them as nautical terms to be understood by sailors, and it was thought desirable to use a technical term like that. But we think it is very difficult to get a short definition that is suitable. I should think very likely it might be possible to say, "a vessel not at anchor or made fast in any way."

Mr. Goodrich (United States).—Mr. President, will the learned Delegate let me interrupt him for a moment? I was drawing a Resolution for Captain Salvesen, and the thought at once occurred to me to use those words and even one more: "Under way in these Regulations shall refer to every vessel not actually anchored, moored, or made fast." Suppose she is being towed? She is made fast, unless you say that the whole tow is one body, and that the vessel is not made fast. We are going to have difficulty in any way in which we attempt to explain it, but I think it is well to have it printed.

Mr. Hall (Great Britain).—Before you hand that in, may I make another suggestion? There is a case which has been very much discussed, where a fishing-vessel gets fast to a rock. Then we would have to determine whether or not she was a vessel which ought to come within the explanation of a vessel not under way. So that we have got to provide, if we can, for every possible contingency, and it may be necessary to put something in the definition to meet such a case as that.

Mr. Verney (Siam).—Mr. President, I want to suggest that there is this difficulty in the case where a vessel drags her anchor, and a very difficult case it is. I do not think it has been met by what any of the Delegates have stated up to this time.

Mr. Goodrich (United States).—Mr. President, I may call the attention of Delegate Hall to Article 10, subdivision (*d*), which measurably meets the suggestion which he makes, although not entirely. It speaks of a vessel when fishing becoming stationary in consequence of her gear getting fast to a rock.

The President.—Is there any further discussion of Article 6?

Captain Van Steyn (the Netherlands).—Article 6 provides only for a sailing vessel being towed, and not for a steamer, and so, perhaps, a steamer may not know what lights to carry when she is being towed. Article 1 only provides for a steam-ship under sail and not under steam; but when a steamer is being towed she is not under sail, and she would not know which light to carry. In this case we propose to have this Article read:—

"A sailing-ship under way, or being towed, and a steam-ship being towed, not using steam, shall carry the same light"——

Mr. Hall (Great Britain).—Mr. President, that applies, of course, to the steam-vessel being towed which is not using her engine or steam at all.

Captain Van Steyn (the Netherlands).—Yes, Sir.

The President.—The Chair desires to announce the following Committee. The Secretary will please read the Resolution and the names of the members of the Committee.

The Secretary read as follows:—

"That a Committee of three be appointed to prepare the material for printing the International Rules of the Road, as ordered on Thursday, the 17th instant, together with any other memoranda of changes in the law of other Powers than the United States."

The Chair appoints the following:—

Dr. Sieveking, Delegate for Germany; Mr. Frederick William Verney, Delegate for Siam; Mr. P. Tsukahara, Delegate for Japan.

The President.—The Chair will take this occasion to state that the Committees ordered upon the subject of lights and of sound-signals will not be announced until Monday.

The Chair hears no further suggestions in regard to Article 6; the Conference will proceed to the consideration of Article 7. If it is desired that the Articles should be read as they are considered it will be done; but as each Delegate has them in print before him, it might save time to dispense with the reading; if there be no objection this will be done.

Article 7 is now before the Conference, but before proceeding to its consideration the Chair desires that Mr. Goodrich will explain fully what was intended by the proposition with reference to the changing or amending of Articles, so that there may be a distinct understanding about the manner in which they are to be presented to the Secretary.

Mr. Goodrich (United States).—Mr. President, in pursuance of what the Chair suggests, and rather for the benefit of those who do not thoroughly understand English, I will make these suggestions, which the interpreter will put in French later. It is desirable that each one of the Delegates shall have before him the proposed change in the Rule, in such form that he may see at a glance what it is. If, for instance, I propose to amend Article 1, and say strike out the first line, "sailing-ship," and insert "steam-ship," every one is put to the trouble of comparing my amendment with the original Article, and the more numerous the amendments the greater the difficulty. Whereas if they have before them a paper wherein every obliterated word shall have a line drawn through it, the obliteration still leaving the words under it clear and readable, the same paper showing every new word or new sentence to be inserted printed in italics or written in italics, we shall have the old law Regulations before us as well as the proposed changes, so that we can instantly compare the old with the new. I do not know that I can make myself clear. For instance, the British programme, measurably, has done the same thing, but they have printed the old Articles side by side with the new. It may be that this may be deemed the best way. But still I think that the proposed method becomes even clearer than when you put in the old Article side by side with the new one. The Secretary suggests that he will furnish to any member who desires to make an amendment a copy of these printed Treasury Regulations which contain the old Articles, and any member can cut out the Article which he proposes to amend, draw his pen lightly through the words he proposes to obliterate, and add in the margin the words which he desires to add to the Article, so that after all it will not be a very great labour for every Delegate to prepare and submit in writing or print that which he desires to present to the Conference.

The foregoing remarks of Mr. Goodrich were translated into French and read to the Conference in French.

Mr. Flood (Norway).—Mr. President, in reading through Article 7, I have stumbled over the expression that these lights shall be kept on deck on the respective sides of the vessel. I think that if the weather is such that these small vessels cannot keep their lights up in the rigging, practically, it would be almost impossible to keep them on deck, actually on deck, according to the letter of this Article. I think that there may be occasions when it will be absolutely necessary to keep them down in the companion-way or in the cabin somewhere, as a protection. I was going to inquire how that would be in case of a collision, when, in the course of the investigatson, the question would be: Had you, according to law, your lanterns lighted and on deck? And you would have to say, No, we had them in the companion-way under the deck. If it could be possible for any expression to be used there that would cover this point, I think it would be advisable. For instance, it might be expressed, "to be kept in a convenient place, if practicable on deck," or something to that effect.

Mr Hall (Great Britain).—Mr. President, perhaps the Delegate from Norway will allow me to make a suggestion? I cordially agree with the difficulties which he has pointed out, and would suggest whether or not it would be, perhaps, desirable to use the phrase, "to have at hand ready for use."

Mr. Flood (Norway).—Mr. President, my only object is to get that "on deck" out and not leave any legal question.

Captain Shackford (United States).—Mr. President, I have a word to say on this Article. It appears to me that no vessel should be under way between dark and daylight without any light of any

kind, except one of such a character as is described in the Rules, which is dependent entirely upon the vigilance or sleeplessness of one man aboard. I think all vessels at sea, at night, should carry a light of some sort under all circumstances. The same remark applies also to Article 10.

Captain Salvesen (Norway).—Mr. President, we have some small craft in Norway which do not come under this Article. They are mentioned in Article 9. We legally adopted the provision for carrying a top-lantern during the night; but it was shown that it was quite impossible for them to carry it. Our pilot-boats go alongside of the ship in their own boats, and the sea is often so high that it is impossible for any boat of that size to carry a lantern. So we were obliged to order, last year, that they had only to show, and not carry, a white lantern to approaching vessels. Perhaps, now, under this Article 7, it would be appropriate to include the lanterns used by small vessels which are required to be shown to other vessels, according to the Regulations. The smaller vessels should not be required to carry them, because it is quite impossible for them to do so. This is, at present, only a suggestion which I take the liberty of making.

The President.—The Chair desires to state that all suggestions from Delegates should be in the form of amendments, so that they could be printed and placed before them at some future time. Remarks and suggestions without being in the form of amendments will appear in the Protocol, but will not appear for future consideration. Therefore, all suggestions should be put in the form of amendments to the Regulations.

If there are no further suggestions or amendments to Article 7, the Conference will proceed.

Captain Shackford (United States).—Mr. President, I want to call the attention of the Conference to the fact that when this Article is called up finally I will propose that it shall be abolished.

Captain Bisbee (China).—Mr. President, I beg leave to suggest for consideration whether it is not necessary and advisable that Article 7 be altered so as to provide that coloured lights, when exhibited under all conditions provided for, shall not be shown further abaft the beam on either side than the Rule provides for. The Rule provides for two points abaft the beam, but there is nothing in the Rule at the present time to prevent a man from presenting his light so that it shall be seen even in line directly astern.

The President.—Will you be kind enough to put that in the form of an amendment?

Captain Shackford (United States).—Mr. President, I wish to move now that the entire Article 7 be abolished.

Captain Malmberg (Sweden).—Mr. President, I beg to second that motion.

The President.—This is a motion to strike out the entire Article.

Captain Malmberg (Sweden).—Mr. President, the reason why I wish to second that motion is that, in my opinion, Article 10 can be made to cover Article 7. The reason why I say so is that Article 10 provides for "boats," and there are very few craft other than boats on which the side-lights cannot be fixed. That is the reason why, in my opinion, Article 7 might be eliminated.

Mr. Goodrich (United States).—Mr. President, I think Delegate Hall has something to suggest on the subject of small vessels—like small steam-vessels—being required to carry the ordinary side-lanterns.

Mr. Hall (Great Britain).—Mr. President, I do not propose to make any alterations in regard to Article 7, dealing with small vessels. The object of Article 7 was that the small boats should have side-lights which they could show to approaching vessels, which they were not bound to carry, for the simple reason that it was difficult for them to carry them, and, if they did carry them, to keep them lighted. That, of course, only applies in bad weather. The members will see that Article 7 only applies to bad weather. They are not justified in not exhibiting side-lights in ordinary weather. It is only in bad weather when they cannot fix their side-lights, and keep them up, that they are excepted from doing that. But they are obliged to have them at hand to show on the approach of vessels.

Captain Shackford (United States).—Mr. President, I understand that thoroughly, but it seems to me that a vessel which cannot show lights ought not to be outside in the sea. She ought to be in a harbour. It seems to me that no vessel ought to be at sea and endanger her own safety and the safety of other vessels but what should have a light of some kind, not depending upon a man or boy and upon their vigilance and sleeplessness.

The President.—The Chair will take this occasion to announce that he has received a call from Captain Mead, the Commandant of the Navy Yard, and that he presents his compliments to the members of the International Marine Conference, and offers his services to them if he can be of any assistance or show them any attention. He also desires to state that he will be glad to show them anything at the Navy Yard in case they should desire to visit it.

Mr. Hall (Great Britain).—Mr. President, perhaps I should be but expressing the feelings of my brother Delegates if I move a Resolution thanking the gallant officer for the kind invitation which he has extended to us.

The President.—The Chair will be happy to communicate this to the officer.

A Resolution of thanks was thereupon adopted.

Captain Malmberg (Sweden).—Mr. President, while we are discussing this Article 7, there is something which strikes me as rather a hard question. Note the last sentence. It reads in this way:—

"To make the use of these portable lights more certain and easy, the lanterns containing them shall each be painted outside with the colour of the light they respectively contain and shall be provided with proper screens."

Now, the screen is to be 3 feet. That is a proper screen. How are the lanterns to be provided with proper screens if they are to be portable, in a small vessel, and taken below? I do not see the possibility of doing it. That is the reason, also, why I want this Article taken away.

Mr. Goodrich (United States).—Mr. President, we might also add that there might be some difficulty at night to distinguish the colour of the painted board or painted lantern.

Mr. Hall (Great Britain).—Mr. President, I think I may say that in England we have found no practical difficulty, and that these vessels carry them and show them. We have had no difficulty, and the lamps are used habitually by vessels.

Captain Shackford (United States).—Mr. President, are not vessels frequently run down on account of having no lights?

Mr. Hall (Great Britain).—They ought to give notice of their whereabouts. If a vessel is injured it is her own carelessness, and she would be liable, according to our law, if she did not do it.

Captain Shackford (United States).—Mr. President, that is what I want to provide against—carelessness of the people on vessels.

The President.—If there be no other amendments or suggestions, the Conference will proceed with Article 8.

Mr. Flood (Norway).—Mr. President, I would like to propose that the heading of this Article 8 be made to read like this: "Lights for steam-vessels and sailing-vessels not under way," instead of "at anchor." The reason for this is that Article 8, in the first paragraph, says, "a ship, whether a steam-ship or a sailing-ship, when at anchor, shall carry."

I think it would be advisable also to insert the following words: "or moored to a buoy." It is often the case that a vessel temporarily moored to a buoy is as much of an obstruction on a dark night as a vessel at anchor. It seems to me that it would be well if we should make provision for such a case in this Article. I have personally been in such circumstances, and take the liberty of mentioning it.

Mr. Hall (Great Britain).—Mr. President, I have an amendment to propose, and perhaps the members of the Conference will kindly allow me to preface it with the reason for which we propose it. We have found now that vessels are built of such an extreme length that it is frequently misleading to vessels approaching one of them at anchor, if they only see one riding-light on her. Accordingly, in a good many of our rivers, there are local Rules by which vessels are bound to carry two riding-lights when they are at anchor. We think, perhaps, that we should not put this duty upon small vessels upon which one light is amply sufficient, but that in all vessels, beyond a certain length, they should be bound not only to carry the riding-light, which is carried forward as at present, but that they should carry a second light aft at a different altitude, and at such a marked difference in altitude that any sailor approaching could see that it was two lights on board of one vessel and not one light on board of two different vessels. We think that, especially in reference to harbours and ports, it would be important to give this information to the officers of vessels under way. Therefore, I propose to amend Article 8 as follows: After the words "a ship," in the first line, insert "under 100 feet in length." If these words should be inserted it would make it necessary for vessels under 100 feet to carry only one riding-light. All ships of 100 feet or upwards in length, when at anchor, would be required to carry two such lights, as follows, that is to say:—

"In the forward part of the ship, and at a height of not less than 20 feet and not to exceed 40 feet from the hull, one such light, and at or near the stern of the ship, and at such a height that it shall not be less than 15 feet lower than the forward light, the other of such lights."

I propose to add also these words, which are not printed in the document which I have handed to the members of the Conference:—

"The length of the ship shall be the length appearing in her certificate of registry."

That would prevent any dispute as to how to measure the length of the vessel. We thought that was the simplest length to take, because that could be arrived at accurately without any difficulty.

Captain Shackford (United States).—Mr. President, I am very sorry, indeed, to differ from Mr. Hall. I should like to know how, in a ship 600 feet in length at anchor, it is possible to distinguish her from two vessels at anchor. How is it possible to distinguish a ship 600 feet long with two lights, one forward and one aft? Whether one is higher or lower than the other makes no difference—how is it possible to distinguish her from two vessels at anchor?

Mr. Hall (Great Britain).—Mr. President, I agree that it is impossible to say for a certainty; but if an officer knows that a long vessel shows two lights, one high and one low, if he is a man of ordinary prudence, he would say to himself: That probably is one vessel with two lights. If he does think it is two vessels, and attempts to go between them, he is guilty of negligence in not seeing his way clear, and in proceeding before he could find out whether it was one vessel or two vessels.

Captain Shackford (United States).—Mr. President, I think the Courts have also held that vessels at anchor with two lights are at fault.

Mr. Hall (Great Britain).—Mr. President, that is because at present a vessel is required to carry only one anchor-light and no others. It is in order to give warning to vessels approaching that she is a big vessel, and therefore, she has her second light up. It is to provide for this difficulty that we suggest the two lights. We know that officers very often, out of excessive caution, have been putting up a second light, and have been doing so contrary to the Rules.

Captain Shackford (United States).—Mr. President, I will read what I have written here. In my opinion the riding-light should be of such a character that immediately upon its being seen it could be determined, without hesitation, that it was on a vessel at anchor, and was not a steamer's masthead-light, a stern-light, or a light on shore, for any one of which the lights at present carried might be mistaken. A red and white light, one above the other, or one forward of the other, would be an improvement.

I would like to have the opinion of some of the other gentlemen on Article 8.

Mr. Goodrich (United States).—Mr. President, I am requested by Captain Norcross to suggest to the Conference this matter for their consideration. He suggests that there should be constructed on all sea-going vessels, regardless of their size, a tower between the cat-head and fore-rigging, accessible from in-board, the lantern to be a fixture in this tower, and the lamp placed in such a position that the light cannot shine across the bow. This would do away with the screens, which are often inoperative, the suggestion being that this tower, light in construction of course in a small vessel, would save the extinction of the lamps by the sea, and would follow out the suggestion of Captain Shackford that there would be no necessity to depend upon the vigilance or sleeplessness of a single person in charge of the deck. Of course it might possibly come quite as well in a division of the Programme in regard to the construction of vessels; and yet it is germane to the subject of Article 7 as to the fixing of lights aboard small vessels, instead of having to have lanterns with a screen, as is required by the Statutes.

Mr. Verbrugghe (Belgium).—Mr. President, if I understand aright, the propositions made at present are not to be discussed yet. They will be examined by the Committee, and we will have some chance to discuss them, if we have any amendments to make afterwards. Do I understand correctly?

The President.—The Committees will make their Reports on the subject, and that will give us additional information; but I understand it to be the general intention of the Conference that there shall be discussions of these Articles as they are presented.

Mr. Verbrugghe (Belgium).—Mr. President, I see by the amendment made by the learned Delegate from Great Britain that the length of the ship is given in feet. This Rule, of course, will be international. Now I believe there are as many sizes of feet as there are countries or even towns. It is a matter of importance that the length should be exactly determined. For this reason the explanation is given that the length of the ship shall be deemed to be the length appearing in her certificate of registry. In my country we are not allowed to count anything by feet. The metre is our rule, and any one found measuring by feet is liable to a fine. Very likely this may be the case in some other countries; for instance, in France. I will, by-and-by, call upon my French colleague to support my motion. I would suggest that this length and the other dimensions given in the Rule should be stated in metres. Everybody knows exactly the meaning of the word metre, whereas feet, as I have just said, may be different. Of course it is understood to be an English foot, but it will be rather puzzling for every one to bring this measure down to the English measure.

Mr. Goodrich (United States).—Mr. President, I suppose the time is coming when all the nations will say that we shall have a common standard for measures and for money. It suggests to each one of us that the millennium is approaching when Delegates from all nations, including the Oriental nations, meet in Conference in quite a modern city. The difficulty of the proposition of the gentleman is this, that it seems to me he wants to transfer from the shoulders of the nation who use the metre as a measure, to the shoulders of a nation who use the foot as a measure, the burden of finding out what the exact measurement is in our English feet. As I understand it, the English foot has a definite significance. It is 12 inches, and an inch is defined in a way that any one can understand. I started to quote it, but I cannot quote it, as I am not quite sure about it. Captain Simpson says that the yard is the standard fixed the world over. I should be very much opposed, very positively opposed, to a change from the use of the foot to the use of the metre. We are discussing these Rules as they were adopted by Great Britain, which took the lead in these matters, and whose lead in that respect we are quite willing to follow, and we have shown our willingness to bow to it when the United States adopted the International Rules as proposed by them without a Conference. I see, however, no practical difficulty in the matter of having the foot named as the unit of measure, because when Belgium, for instance, desires to pass a Statute for the adoption of the Report which we make, she can translate foot into metre by saying approximately that the length shall be 33 metres for 100 feet. I think there will be no practical difficulty in any nation changing that part of the Rule. I think that there should be no alterations in the general law.

Mr. Verbrugghe (Belgium).—Mr. President, I do not insist particularly about it. Of course it can be reduced. Mr. Goodrich made a very sensible remark in opposing my proposition. I thought that of all the nations represented here the majority would be found to employ the metre; but if that is not the case, of course I do not insist upon the proposition I made.

Captain Richard (France).—Mr. President, I wish to remark, on behalf of my country, that we consider that the dimensions should be given in metres. This metrical system is universal and well understood, and for that reason I propose that all the dimensions should be given in metres. There can thus be nothing equivocal about it.

Now, in this discussion an undue importance, in my opinion, has been attached to the question of signals at anchor; but you will see that this question of measurement, and how it should be determined, is a new question in England and in other places, and, if it were discarded, it might give rise to misunderstandings and losses. I propose, then, and I think you will second me in the proposition, that all measurements should be according to the metrical system.

Rear-Admiral Viel (Chile).—Mr. President, I want to say in this connection that, when the first Rules of the Sea were established, the French and English texts were adopted, side by side, by an agreement between Great Britain and France; and it was only according to that agreement that these Rules were given to the other nations of the world as Rules of Measurement.

But I desire to support the proposition made by the honourable Delegate from Belgium. The Spanish nations, or nations speaking the Spanish language, are now numerous, and there are a number of them now represented in this Conference. I want to know if it is not possible that we may adopt a translation of the metrical system? Since England and the other nations, some of them, have another system, I propose to have a translation of the metrical system made and adopted, in order that, as a system of measurement, it may be generally understood. It is in this way, and by a correct translation only, that it can be understood in Spanish; and I will submit to the Conference—although they spoke yesterday here of making the text of the law only in English and French—that

they should also make it in Spanish. And I propose to have this system of English measurement also translated into metrical measure, in order that it may be understood according to the metrical system in use in Spanish-speaking countries.

Captain Mensing (Germany).—Mr. President, I would like to ask, for my personal information, from the Delegates of England and America, whether in their own country the standard of metres, as a standard of lengths, is not one perfectly legal and received by law? According to my understanding the metre is a legal standard both in England and the United States, and can be used as such. I should not see any difficulty whatever in introducing in this Article the length given in metres, as I believe it would be understood all the world over.

Mr. Hall (Great Britain).—Mr. President, I think I should say that the measure of the metre is not, so far as I know, adopted by us in any form or way. I agree with the learned Delegate for the United States that there would be no possible difficulty in any nation which adopted these Rules giving the equivalent in their standard of 100 feet. We have occasion to know that every day in cases where German and French vessels are involved, where we have, of course, to introduce and interpret their documents, and of course where the word "metre" is used, we take the equivalent of it in feet, and so arrive at the length. I cannot see how there is any difficulty whatever in each nation, when it translates the Rules, giving an equivalent of 100 feet in length by their standard, which can be computed very easily, because, as the learned Delegate for the United States very properly stated, it is a perfectly fixed ratio and perfectly well known quantity.

Captain Van Steyn (the Netherlands).—Mr. President, the Dutch Delegation have been considering the case of a vessel at anchor, and we have a proposition to make:—

"A ship, whether a steam-ship or a sailing-ship, when at anchor, shall carry, where it can best be seen, at a height not exceeding 20 feet above the hull, a white light in a globular lantern of a candle-power to be visible 2 miles, if the length of the ship does not exceed 120 feet. A ship of above 120 feet to 240 feet in length shall carry the anchor-lights and stern-light at the same height, and above 240 feet, one light in the midships higher than the two other anchor-lights, forming a triangle with the other ones, and all of the same candle-power."

Mr. Flood (Norway).—Mr. President, may I ask that the interpreter be required to interpret for us what the Delegates have stated in French?

Thereupon the remarks made in French were interpreted to the Conference by the interpreter.

The President.—Are there further suggestions upon Article 8?

Captain Malmberg (Sweden).—Mr. President, there has been a good deal of mention about feet and metres. Now, these Regulations are to be printed, as decided yesterday, in English and French, and a proposal has been made to-day to have them printed also in Spanish. Thus we have in English the word "feet," and in French and Spanish we have "metres." I do not see that it can be arranged in any other way, because we cannot expect England and America and other countries using "feet" to adopt our metrical system. When these Articles are printed in our own different languages we will know exactly how to express in metres the English feet.

Mr. Verney (Siam).—Mr. President, I venture to suggest that if an Article be inserted in the Regulations—a definition—informing all who read it what relation the metre bears to the foot, we need not discuss this matter any further.

Captain Sampson (United States).—Mr. President, there seems to be only one slight difficulty in this whole matter, as has been pointed out by the different speakers. The relation existing between the foot and the metre is fixed and invariable. Now, as the gallant Delegate from Austria-Hungary has just pointed out to me, the practice in his country is to translate freely, or to convert the feet and inches, as the case may be, into metres, or decimetres, or centimetres, as the case may be. If it is distinctly understood, or can be embodied in these Rules in such a way that 100 feet shall or may be so translated that there will be no legal difficulty in the adoption of an approximate value in metres for the 100 feet, there will be no difficulty about it. The question ought not to be left to turn upon the small difference between 33 metres and 100 feet, which might decide a case one way or the other in case of a dispute about a collision. It seems to me that the whole difficulty has already been met by the countries which use the metre, by giving the nearest number of metres, &c., to the number of feet which are expressed in English Rules.

Mr. Verbrugghe (Belgium).—Mr. President, I am very glad to have provoked this discussion. If the length had been stated in feet the translation in some other countries would have been in feet as well. Now, it has been agreed so far that the exact value of this English foot shall be decided. That is the very thing we want.

Mr. Hall (Great Britain).—Mr. President, perhaps I might point out that, so far as I am aware, no difficulty has ever arisen as yet under the existing Rules of the Road as to the meaning of the word "feet." It is a word used throughout these Rules. The height at which the lights are to be carried is laid down in feet. But, so far as I am aware, there has never been any discussion whatever as to the relative value of feet and metres. I do not think any one has been misled at all by the use of the word which has been in use up to the present time, ever since the Rules were framed and drawn. You will find the word in subsections of Article 3, and all the way throughout the Rules.

The President.—Is the Conference ready for the next Article?

Mr. Hall (Great Britain).—Mr. President, I have an amendment to present to the Conference on the question of pilot-vessels. We have drawn it up, having in view the difficulties which often arise, especially to steam-vessels. Pilot-vessels looking for a job come up to steam-vessels, and frequently go about right under the very bow of the vessel, and the officers in charge of the steam-vessels are unable to see what the pilot-vessels are doing, and they are very often very much hampered. It is not only very dangerous to the pilot-vessels, but very dangerous to the other vessels also. We would propose what is contained in italics, and if the members of the Conference will allow me, I will read

the proposed change. It is not quite the same as what was printed, because in the original proposa the members will see that we propose that they should have one lantern with coloured glasses, which should be used. But, on further consideration, we have thought perhaps it is more desirable to have two lanterns. If there was only one lantern, a man, in the exigency of the moment, might, perhaps, flash the wrong light and and throw a green light when he wanted to throw a red light. We have thought that they should have two lanterns, like those small vessels are obliged to have. I proprose to insert before the words, "A pilot-vessel, when not engaged on her station on pilot duty, shall carry lights similar to those of other ships," this paragraph :—

"When approaching a ship to put a pilot on board ; a pilot-vessel shall have at hand two lights, one red and one green, so constructed that they can be flashed instantaneously, which shall be kept on deck on their respective sides of the vessel ready for use, and shall flash one of them in sufficient time to prevent collision, so that the red light will only be shown on the port side, and the green light only on the starboard side."

Dr. Sieveking (Germany).—Mr. President, this Article 9 has, in practice, given rise to very serious and very delicate questions, and I hope, therefore, that I shall be excused for making a few remarks, which, perhaps, go a little more into the details of the matter than would be allowed under general discussion. I beg to say, before entering into the details, that what I intend to suggest rests entirely on the same principles as the amendment proposed by the learned Delegate from Great Britain, and it is only my intention to follow out a little further the idea which is suggested in the amendment.

It is quite clear that the situation of a pilot-vessel when on duty is a peculiar one, and must be distinguished from that of other vessels. First of all, pilot-vessels must be distinguishable. Ships approaching must know that this is a pilot-vessel. Then there may be different cases arising. A pilot-vessel, although on duty, may not be required, or she may be required, to approach another vessel. Even although not required to approach a vessel, she may intend to approach for several purposes, either to offer her services or to make some inquiry, as often happens, or to put a pilot on board and give him an opportunity of returning homeward, or some other purpose of the kind. This suffices to show that it is a complicated situation, and in order to meet, as far as possible, the contingencies, and insure as much as possible the safety of pilot-vessels and of vessels meeting them, this Article must be very carefully considered.

Now, the Rules as they are framed at present give to a pilot-vessel a top-light or masthead-light only, and a flare-up light to distinguish them from other vessels. This, so far as I am aware, is quite sufficient to distinguish pilot-vessels from other vessels, but it is not sufficient to enable other vessels to distinguish the course of pilot-vessels. I have been informed by a practical man that the flare-up light—of course, the masthead-light would never indicate the course—is such a dazzling light that it is very difficult to ascertain the course of a pilot-vessel by looking at the flare-up light only. They say that for this very reason, that it is a dazzling light, the people on board the pilot-vessel generally have them burned low, so that the masts and sails of the pilot-vessels are very much in the shadow of the darkness. Then they say that the shape of the rigging of pilot-vessels and the sails are very nearly the same when seen from one side or the other. Of course I would not give my judgment on that, because I am not a practical man. I only state what experienced and practical men have told me, that it is very difficult to ascertain the course of a pilot-vessel by the masthead-light and the flare-up light only. Now, as there are cases where the pilot-vessel, although on duty, does not at all intend to approach another vessel, and where she is not required to do so, it would be very advisable, I think, if this Rule could be amended so that the course of pilot-vessels would be better indicated than it is now. The reason, so far as I am aware, why pilot-vessels only carry a masthead-light is that they could not be distinguished from steamers if they carried side-lights. This is very true. But then, if another signal was introduced—but, of course, that must be left to the consideration of experienced nautical men—say, for instance, a pyrotechnic light, a red light, or a red and white light, which was to be shown at intervals to distinguish them as pilots, and, apart from this, they were allowed to carry the same lights as other vessels, then I think the advantage would be such that the course of pilot-vessels could be distinguished better than they can be now.

Pilot-vessels may be steam-vessels or they may be sailing-vessels ; but, although steam-vessels carry masthead- and side-lights, pilot-vessels, of course, could be distinguished by the pyrotechnic or other light. At present we have the pyrotechnic light, which they have to show at intervals not exceeding fifteen minutes, and perhaps that is rather too long an interval. Perhaps it would be better to have the pyrotechnic light shown at less intervals than that. I think that other vessels should be at once in a position to distinguish the course and to know the direction in which pilot-vessels are sailing.

Then there arises the difficulty that other vessels do not know whether the pilot-vessels are approaching them or intend approaching them or not, and that is the very thing which the amendment of the British Delegates intends to meet. Therefore I entirely agree with them, so far as the principle is concerned, only, perhaps, it could be simplified a little. It is suggested that, in order to point out their intention to another vessel, they should carry two lights—a red light and a green light. Would it not be sufficient to say that a pyrotechnic light, if it be shown by them in order to distinguish them as pilot-vessels, in case they approach another vessel (or intend to approach another vessel), must be shown at various shorter intervals, at from two to three minutes, and thus announce the fact that they are approaching? This would enable every vessel to know whether a pilot-vessel is approaching, and that is the very thing which has given rise to such complicated and dangerous situations. There have been cases where a pilot-vessel has approached another vessel, and the latter did not intend at all to have a pilot, nevertheless the pilot approached, as it is the custom of pilot-vessels to offer their services in order to earn money, or, as is often the case, to have an opportunity

of communicating with other vessels. It has happened, and it often happens, that although they are not required, still they approach other vessels. Then the difficulty arises. The other vessel does not know that it is the intention of the pilot to approach, and so endeavours to keep out of the way. Of course, if the pilot intends to approach a vessel, she must not keep out of the way, because that would make it impossible for the pilot to come near. Therefore, a signal must be given, it appears to me, to indicate that a pilot-vessel intends to approach, and I believe that in this way every difficulty could be satisfactorily met.

Pilot-vessels shall carry the same lights as other vessels, and be distinguishable by pyrotechnic lights. You could not use the flare-up lights, of course, because that would lead to confusion with the fishing-boats. Then, in case a pilot-vessel intends to approach a ship, a pilot must repeat this pyrotechnic light at very short intervals.

I am not able at present to offer an amendment, because my colleagues and myself have not had the time to frame one which is carefully worded; but it might be something like this:—

"Pilot-vessels when engaged on their station on pilotage duty shall carry the lights required for other vessels of the same class, and shall also, besides, exhibit a red and white light or a pyrotechnic light at short intervals not to exceed fifteen minutes, which shall be repeated at shorter intervals whenever intending to approach a ship."

Here, in the amendment proposed by the British Delegate, it is said: "When approaching a ship to put a pilot on board." I do not think there is any material difference between us about that. So, in following out the idea of the amendment presented by the British Delegates, I only want to suggest that, in order to better indicate the course of pilot-boats, they should be required to carry the lights that other vessels carry.

Mr. Verbrugghe (Belgium).—Mr. President, I am very sorry that I cannot support the proposition made by the learned German Delegate to oblige pilot-boats, in all cases, to have side-lights. The Rule, as it is constructed now, is quite plain: that when a pilot-boat is not engaged on pilot-duty, and not on her station, she is an ordinary boat and carries lights as an ordinary vessel; but when she is on her station and on duty, she is distinguished from other boats. It is for some good reason that a white masthead-light has been given to the pilot-boats; to extend to them the immunities attached to such white lights; and, as a fact, a pilot-boat in the act of getting her boat in or out, or towing her boat in a heavy sea, cannot get out of the way of another vessel. Now, if a vessel wants a pilot she goes to the pilot-boat station and makes the proper signal. That is the general rule. Then the pilot and manœuvres to the ship. For instance, if a steamer wants a pilot, she knows where to go and where to find one; and when she has got near the pilot-boat she stops, and the pilot-boat manœuvres to board her. If you would give the pilot-boat the two lights and the other lights, it is really too many lights—too difficult to distinguish. I repeat again, when she is not on her station, engaged in her pilot service, she is an ordinary boat. When she is on her station, her proper signal is to carry a white light at the masthead, and also to exhibit a flare-up light. This, I believe, is a far better distinction than to give her the lights of an ordinary boat.

Where I agree with the learned Delegate from Germany is, that some signals should be made to enable the pilot-boat to signal that he wishes to enter into communication with the ship. As Dr. Sieveking said, it is often the case that a pilot-boat wishes to hail a ship to put a pilot on board or make some communication, and the vessel, not wanting a pilot, keeps away from the pilot-boat. There should be some way by which a pilot-boat could indicate that she wishes to communicate with a vessel, and so far as that I would support the proposition.

Captain Mensing (Germany).—Mr. President, will you kindly permit me add a few explanations to the remarks made by my colleague? It is simply to explain a few little things, for I am sure I cannot add anything of material interest to what he has stated. The white light has one meaning in every place in these Regulations; that is, it calls attention to existing danger. We have a white light meaning a ship at anchor; we have a white light as a sign or signal of a boat being fast by a cable to the ground, or something like that; we have a white light as a signal of a ship being overtaken. Now, should a white light alone be seen, if it were not for pilot-vessels, one would always know exactly the meaning. That is to say, the white light would be a sign of warning to keep a good look-out. But with the pilot-vessel it is entirely different. The pilot-boat wants to reach you, and you want to get near the pilot. This is one reason why I think an alteration should be made, so that pilot-vessels could have a distinctive signal, showing that they are pilots and not other boats.

On the Baltic and on the Prussian shores, and so far as I know in Denmark and Norway, where there are hundreds of pilot-boats, and where the weather is bad and stormy, these boats have no chance of carrying a white lantern at the top of their masts. It is impossible; they cannot do it, and do not do it. This, therefore, has been the reason why, in several of these countries, the white light has been taken away from pilot-boats entirely, without, so far as I know, giving rise to any difficulties whatever. Ships have always been able to make themselves entirely understood as to what they are and what they come for. I think that it is nearly impossible to go anywhere along the Norwegian shore or the Swedish shore without finding these pilot-boats, and you will get a pilot just as sure there as you will sailing for the port of New York. To find a station, as stated by the honourable Delegate from Belgium, is an easy matter. The New York pilots are sometimes found as much as 500 or 600 miles away from home, and I think that this happens not only here, but at the entrance to the English Channel. In the English Channel there are quite a number of pilot-boats from England, Belgium, &c., and, if they could show these lights, which we recommend, it would be very easy to distinguish them.

Now, in order to do away with this white light, which it is impossible for our small boats to carry, we have had an idea of introducing the pyrotechnic light, and I may add, at the same time, that it has been brought up as a suggestion among ourselves whether it would not be advisable to allow another

signal to be added at the masthead; for instance, a red light instead of a white one. This light might be raised at the option of any pilot-boat when she wanted to show her station or place.

It may be said that this would bring quite a good deal of expense to these pilot-vessels, but I do not think there is any difficulty on that point. If the pilot-boats show that the expense they have incurred in providing the pyrotechnic lights and other masthead-lights should exceed a certain moderate sum, it would be very easy to augment the rates of pilotage, so that they should not suffer from it, if we could by so doing get rid of the white lights. If the white lights be only used as a warning of danger ahead, it would be very easy to do something, in Article 10, for open boats and small fishing-vessels, and to give the white lights to them. We have suggested, for the consideration of the Conference, that the white lights should be reserved for small fishermen and others to whom it may be a greater benefit, as it is a cheap and powerful light, and, I think, the best thing that can be obtained at a moderate outlay.

Mr. Goodrich (United States).—Mr. President, Captain Norcross, one of our Delegates, suggests something that has not yet been brought up in this discussion, and which possibly the Conference may hereafter conclude meets the difficulty, and that is, that the pyrotechnic light which the Delegate from Germany suggested might be a red signal, perhaps a red Coston or a red Payne light, to be shown when the vessel was on the port tack, and a green pyrotechnic when the vessel was on the starboard tack.

I can see at once that that would have a double value. In the first place, it is consistent with some of the other Regulations which indicate the starboard tack by a green and the port tack by a red light, and in addition to that, these signals, burning over a minute, which I think is the ordinary duration of the operation, or perhaps a minute and a-half or two minutes, would indicate the change or the movement of the vessel, so that an approaching vessel could a little more easily distinguish the direction in which the vessel was moving when she observed by compass-bearing the changes of this moving light. Of course, indirectly, that would be somethiug of a guidance.

Now, I do not at all like the use of the word "option" in the remarks of the gentleman from Germany. I do not want any option in these Rules. The minute that you permit a sailor to have an option, whether he will or will not do a certain thing, you introduce confusion in the Rules. I want to see these Rules, as far as they can be made, as rigid as steel, so that there shall be no doubt what the Conference of nations mean. They say, "Obey these Rules, and you will be saved from the danger of negligence; disobey them, and the Courts will impose upon you the penalties of disobedience to the Rules adopted by the nations of the world."

I thoroughly agree with Captain Mensing in regard to the difficulties of finding the pilot-boat zone.

Captain Norcross suggests to me that the Coston light, as the Delegates know, is of such a character and power that it illuminates the sail so that the loom of the vessel can be seen all the way across.

Now, in the port of New York, there are two sets of pilots, New Jersey pilots and New York pilots, who are acting under the laws of their respective States, but in most things these laws are harmonious. The pilot-boat which gets the farthest out to sea gets the most money. There is a line called the inshore pilotage line, inside of which pilots get a certain compensation per foot, and outside of that line they get a certain other compensation per foot. I will withdraw that part of the statement for the present. At any rate, there is so much competition amongst the various pilot-boats in New York that they go off as far as they can to seek vessels, and you can never tell where you may meet a pilot-boat, especially if the vessel which the pilot-boat is seeking is a vessel of great draught.

Mr. Verbrugghe (Belgium).—Mr. President, may I say a word to defend the white lights? The gallant Delegate from Germany stated very well that in the Channel there are English pilot-boats and pilot-boats of other nations. I do not see what difference that can make. I understand that the zone for pilotage is that which is in the vicinity of the port for which you are bound, and if you have missed other pilots you are certain to find pilots there. That is generally the way. Is there any difficulty for vessels coming to New York, for instance, of mistaking pilot-boats? I do not think that there is any chance for mistaking them, because they have their white light on the masthead and also their flare-up; and, as the gallant Delegate from Germany said, "Very well, the white light signifies that you have to keep away from vessels." Very likely it was for that purpose that they gave the white lights to the pilot-boats, and, in my judgment, it was for this reason. A pilot-boat may be unable to keep out of the way of a ship, and therefore, the white light gives her the right of way over other boats, requiring them to get out of the way: In a heavy sea a pilot-boat must be very carefully handled to get her boat alongside of the vessel which she is to pilot. For all of these reasons, and because the flare-up light gives a certain clue which enables you when at a certain distance to distinguish which way the pilot vessel is heading, I would urge the Conference not to change the white light unless every one is perfectly satisfied that it will be for the better.

Dr. Sieveking (Germany).—Mr. President, it is not my intention to continue this discussion, because I am sure, upon looking at my watch, that I would be stopped by the Chair. If you will allow me, merely for the sake of form, to give the Conference a reading of what the German Delegates intend to move with respect to the Articles we have discussed already.

The amendments which we intend to move to pass presently are the following:—

1. It is moved that a preliminary be inserted to the following effect:

"That the following International Rules and Regulations for preventing collisions at sea shall be followed in the navigation of all public and private vessels upon the high seas, and in all waters connected with the high seas and navigable by sea-going vessels."

That Article 2 be amended as follows:

"The lights mentioned in the following Articles, numbered , , , and no others which might be taken for such lights, shall be carried in all weathers from sunset to sunrise."

Then there is another amendment proposed to Article 3: that the words "sea-going" be left out.

That Article 3 be amended as follows:

After the words in section (*b*), "on the starboard side," then insert:
"At a place not less than 20 feet abaft the masthead-light, a green light," &c.

Also a corresponding amendment to section (*c*) of Article 3, by adding after the words, "on the port side," the following:—

"At a place not less than 20 feet abaft the masthead-light—right opposite the lights mentioned under (*b*)—a red light so constructed," &c.

Finally:

"That a certain candle-power be substituted as a standard for the visibility of lights mentioned in these Rules, in lieu of the standard now in force."

There are a few remarks I would like to make in regard to the Committee which has just been appointed, of which I have the honour to be a member. I am told that this Committee is appointed to prepare the material for printing the International Rules of the Road, together with any Memorandum of changes in the law of the other Powers than the United States.

I should feel very much obliged if the members of the Conference who are leaving could spare a copy of their Rules, to enable us to have them as a text before us, so as to carry out our duty as early as possible. I am sure that the greater part of the members of the Conference will be in possession of their own Rules. If they have not a spare copy, at least let me have, as far as possible, a copy of these Rules for a day or two, just to do this work.

Mr. Flood (Norway).—Mr. President, I would like to move that Article 9 shall be taken exactly as it stands in this proposition, excepting these three words in the next to the last line, "on her station," and instead make it read, "a pilot-vessel when engaged on pilotage duty."

The reason for striking out these words has already been stated by Captain Mensing and Delegate Goodrich, and I need not occupy your time. I think that a pilot-boat is on her station when she goes out by Sandy Hook with half-a-dozen pilots on board. She is looking for ships, and that is her business. She is in the regular place where she is looking for that business.

The flare-up light is not so much for her own protection as to indicate to the mariner on a dark night that there is a pilot-boat in the neighbourhood. I think that these words might be misunderstood if they are not stricken out or in some way explained as to their meaning. I propose that these three words be stricken out, and the way I would amend it is this: "that pilot-boats should use the flare-up light as long as there is a pilot on board, on a dark night."

Mr. Goodrich (United States).—Mr. President, I move we adjourn.

At 1 o'clock P.M. the Conference thereupon adjourned until Monday morning, the 21st October, at 11 o'clock.

Washington, Monday, October 21, 1889, 11 *o'clock* A.M.

THE Conference was called to order at 11 o'clock A.M., Rear-Admiral Franklin in the Chair.

The President.—The first business in order this morning will be the reading of the Protocol of the preceding meetings.

And thereupon the Secretary read to the Conference the Protocol of Wednesday, 16th October, 1889.

Mr. Goodrich (United States).—Mr. President, I move that the reading of the other Protocols be suspended for the present, as they are not yet in print. I suggest that there is no occasion for reading the Protocol in the morning, unless some member desires especially that a part of it should be read. It will consume a great deal of time, and it will be here in print upon our tables.

The President.—The Chair will state, before putting that motion, that the printed French Protocol of the first day is not complete, and not correct, and therefore cannot be read this morning. It will be read on another occasion.

The Chair thereupon put the question as to suspending the reading of the Protocol, and the motion was carried.

The President.—Copies will be placed upon the tables, and time will be saved if the Delegates will correct the copies before them.

The first business in order will be Mr. Goodrich's motion with reference to the amendment to the 1st Article of the Rules of the Road.

Mr. Goodrich (United States).—Mr. President, I move to postpone the consideration of the special order for this morning until the Conference have run through with the entire Regulations for the purpose of receiving amendments. I do this upon the suggestion of Delegate Hall, of Great Britain.

The Chair put the motion, and it was unanimously carried.

The President.—Before proceeding further, the Chair desires to announce the Committees appointed under the following Resolution:—

"*Resolved*,—That the Chair appoint two Committees, each to consist of seven Delegates, to be known as the Committee on Lights and the Committee on Sound-Signals, whose present duty it shall

be to examine and report to the Conference the literature on these two subjects which is in the possession of the Conference."

I will now name, in alphabetical order of the countries which they represent, the members of these Committees:—

Committee on Lights.

France	Captain Richard.
Germany	Captain Mensing.
Great Britain	Captain Wyatt.
Russia	Admiral Kaznakoff.
Spain	Lieutenant Vega de Seoane.
Sweden	Captain Malmberg.
United States	Captain Norcross.

Committee on Sound-Signals.

Austria-Hungary	Admiral de Spaun.
Denmark	Mr. Schneider.
Great Britain	Admiral Nares.
Italy	Captain Settembrini.
Netherlands	Captain Van Steyn.
Norway	Captain Salvesen.
United States	Captain Shackford.

The President.—Should the Committees desire the services of the Secretary, they will be kind enough to let me know and I will request him to be in attendance. They are large Committees, and the members will have a great deal of work.

The Conference will now proceed with the order of the day, which will be the further consideration of Article 9.

Captain Van Steyn (the Netherlands).—Mr. President, I handed in a motion in regard to Article 9 on Friday morning, but I did not state the reason for the proposed change. I will now read the Article: "That a pilot-vessel when engaged on her station or on pilotage duty shall not carry the lights required for other vessels, but shall carry a red and white light in a vertical line, one underneath the other, at a distance of not less than 6 feet, and exhibit a pyrotechnic light when wishing to board a ship."

Now, I will tell you the reason why I proposed this. In the North Sea every fishing-boat exhibits white lights from some part of the vessel where they can best be seen. Pilot-vessels are very often surrounded by fishermen, and it is difficult for any ship in want of a pilot to find out the pilot-boat. If the pilot-vessels had a distinct mark, such as a white and red light—a pyrotechnic red light when they want to board a vessel and a flare-up light that may be shown, if necessary, to indicate the after part of the vessel—we believe it would answer the purpose.

The President.—Have you that amendment in form?

Captain Van Steyn (the Netherlands).—Yes, Sir; I have it.

The President.—The Conference will now proceed to Article 10.

Mr. Verbrugghe (Belgium).—Mr. President, before continuing the consideration of Article 10, I desire to call the attention of the Conference to the fact that in the Rules no provision has been made as to lights for tug-boats seeking business at a distance from shore. A tug-boat is very easily recognized during the day, but during the night, when not towing, she carries the same lights as other steamers. There should be some means to enable a tug-boat to offer her services during the night. The Conference will decide what signal will be the best. I am not particular about the signal, but I think that some signal should be given to a tug-boat so that she could be recognized at night. A white and a red flare-up light, showing alternately, might be used. I am not particular about the wording of the Rule, and I hope that somebody will assist me in regard to that. I would make it something like this:—

"A tug wishing to offer her services to a vessel shall exhibit to such vessel, in addition to the ordinary light, a white and red flare-up alternately."

Another question about lights is this: I see, in the Rules for the Thames, that vessels when employed to mark the position of wrecks or other obstructions exhibit certain lights. It would be, very likely, a good thing that there be a uniform method of lighting vessels employed to mark wrecks, not only at sea, but in all waters open to the sea, to enable a ship-master when he sees such a light to know it marks a wreck, and on which side to pass. I would suggest this:—

"A vessel, when employed to mark the position of wrecks or other obstructions in the sea or in waters open to the sea shall exhibit three bright lights, two placed vertically, not less than 3 feet apart, on the side of the wreck where the obstruction is, and one light on the side of the fair-way."

There is another point to which I wish to call the attention of the Conference. In Article 2 it is said that no other lights than those mentioned in the Rules shall be shown, yet large steamers do show a great many lights from deck-houses, skylights, &c. I believe that a great majority of the Conference will vote to sustain these lights, because large ocean steamers are usually recognized by these lights. What I wish is that it should be mentioned whether it is legal to do this.

Mr. Goodrich (United States).—Mr. President, simply following that thought, and in connection with the matter which has just been suggested, I remember that the North German Lloyd steamers carry, on the promenade deck, on the port side, two electric lights, shaded with red glass, and on the starboard side, two shaded with green glass. As these vessels are pretty long ships, it has often occurred to me that these lights might sometimes, in a narrow harbour, result in a collision. It is a curious speculation to know whether that kind of a light may not be absolutely forbidden, as suggested, rather than advocated, by the honourable Delegate from Belgium. This is a thought which ought to be in the minds of the Conference, and it is well to take it into consideration somewhat now, because if we can formulate these propositions or amendments to all of these Rules as we go over them, and hereafter take them up and discuss these separate subjects, it would be a very great help. In other words, if we could have laid on our tables all these propositions, perhaps we might conclude to form a Committee to draft the Rules which group themselves under the same subject; and I think the Delegates ought to give us, as we go over the Rules now, the benefit of their ideas upon any amendment. I am free to say that I do not care whether they think it is good or bad, as an amendment. As I said before, we are none of us pledging ourselves to advocate the propositions which we present. They are merely to get the views of the Delegates upon the subject. I am sure I speak the views of the President when I say that if all the Delegates would give in the amendments and all the amendments suggested by their thoughts as we run over these Rules, as we are now doing, it would be a very desirable thing.

The President.—The Conference will now proceed with the consideration of Article 10.

Captain Malmberg (Sweden).—Mr. President, when we were discussing Article 7 I stated that my opinion was that Article 7, as it stands now, should be taken out of the Regulations, and Article 10 made to cover Article 7. That was only a suggestion. I will make it now in the form of a motion. This is the manner in which I think Article 10 should be made to read, so as to cover Article 7:—

"Fishing-vessels of less than 20 tons net registered tonnage, when under way and when not having their nets, trawls, dredges, or lines in the water, as also vessels of less than 20 tons net registered tonnage, and open boats when under way, shall not be obliged to carry the coloured side-lights."

In that manner Article 7, in my opinion, could go out of the Regulations altogether. I think, also, that any vessel at sea of 20 tons registered tonnage would be able to carry her side-lights.

Mr. Hall (Great Britain).—Mr. President, I should like to call the attention of the members of the Conference to a subsequent part of Article 10, and that is the subsections which apply only to the coast of Europe lying north of Cape Finisterre. I do not know whether it is thought desirable by the Conference that at this International Conference we should deal with Sub-Regulations which would affect only a very limited number of nations, and I think it would be an assistance to the Conference if I would state what is no doubt known to a great many gentlemen in this room, that there is a Conference appointed to deal with this particular question, a Conference of the Powers who are interested in the matter. The question of the lights for fishing-vessels for countries in Europe north of Cape Finisterre is a subject, I believe, with which the Representative of each of these Powers is going to deal. If so, perhaps it may be the opinion of the Conference that it may be unnecessary for us here, representing the whole of the maritime nations of the world, to deal with such matters. It is perfectly true that it may be said that other vessels belonging to other nations go through these waters where these fishing-boats are which belong to the particular nation. Still, of course, that applies to every coast where there are local Rules. Vessels belonging to every nation pass through waters where there are at present local Rules. The same thing would apply with regard to countries lying north of Cape Finisterre. I only wish to call the attention of the members of the Conference to this fact, that there really is another Conference dealing with this subject. These are, after all, subsidiary Rules affecting only a certain number of nations; and if that be so, is it worth while for this Conference to attempt to deal with them as an international matter?

Mr. Goodrich (United States).—Mr. President, will the Delegate allow me to ask him if he has any idea as to what time that Conference will finish its work?

Mr. Hall (Great Britain).—I am not able to say.

Mr. Goodrich (United States).—Is it now in session?

Mr. Hall (Great Britain).—I believe they have been sitting. I do not know.

Dr. Sieveking (Germany).—I do not think that Conference will meet until some time next year.

Mr. Goodrich (United States).—Mr. President, that brings up the question which we discussed the other day, whether this Conference shall make Rules for the world, and leave such Powers as want to make local Rules to except their own countries and waters from the operation of these Rules. I am very positive and pronounced in my own opinion that we had better proceed with our work in our own way; and as we represent every nation on the face of the earth which is largely engaged in maritime matters, I am very strongly of the opinion that we had better make general Rules for the world, and let individual nations make the exceptions. With great respect for my friend, who has made some suggestions on this subject, I think we had better make an amendment to this Rule now and go right ahead with our line of work, especially in view of the remarks of Dr. Sieveking that the time of the meeting of the other Conference was quite indefinite.

Mr. Hall (Great Britain).—Mr. President, I would only point out that these subsections to which I have called attention are not general Rules. They are Rules for fishing-vessels in particular parts of the world. So there are Fishing Rules for America and Fishing Rules for other countries; but are we to discuss the Fishing Rules of America? It is in the same way that these subsections belong to the countries lying north of Cape Finisterre. What I want to point out is not any objection to the principle of dealing with International Rules, but that when we come to a local Rule which has found its way into the International Rules, pertaining to particular countries, the question is whether

or not it is desirable for us to deal with them? I do not quite see where we are to stop with regard to fishing-vessels, or how we are to deal with fishing-vessels through every part of the globe. These are mere local Rules as you will see. I do not suggest that Article 10 should not be discussed as a general Rule as to fishing-vessels. What I want to call to the attention of the Conference is this, that the latter part is only dealing with some local Rules for vessels plying off the coast north of Cape Finisterre, in Europe. These are merely local Rules which have been embodied into the International Regulations. I think it very desirable to have a general Article such as Article 10; but exceptions to the Rule, it may be thought, might be better dealt with by local Rules by the nations on the waters in which they ply.

Mr. Goodrich (United States).—Mr. President, still the same doctrine applies; I do not consider the Atlantic Ocean, north of Cape Finisterre, in any sense a confined locality, nor does the jurisdiction over that part of the sea pertain to European nations any more than the jurisdiction over the Gulf Stream along our coast pertains to the Government of the United States. I repeat again, that every water navigable for vessels, whether it be sea, bay, or river connecting with the sea, should, in my judgment, be within the jurisdiction of these Rules. We should make a Law, and I believe we can make a wise one, after united consideration, which shall govern the vessels of the whole world; and if we can formulate a Law which is satisfactory, and which is eminently proper, which will have the effect of preventing collisions, the nations of the earth, as they come to ratify that which we refer to them, will adopt our Rules if they commend themselves to the judgment of their respective Legislatures. Certainly the waters referred to in the subdivisions of Article 10 are not within the legitimate control of the nations which are adjacent to them. I do not know of anything which has destroyed the whole rule of jurisdiction beyond the extent of a marine league off the coast, and these waters are miles off from the coast, league upon league away. It is the entire North Atlantic, north of Cape Finisterre. I am very anxious that we should proceed, and I therefore desire to impress it now, when, perhaps, I am a little premature, upon the Conference, that my idea of this Conference—and I believe the idea of a great majority of the members—is that we should make a Code of Laws applicable to the whole seas, to the whole maritime commerce of the world, and make it so thoroughly and so wisely that all the nations will adopt it. If any nation wants to make local exceptions for internal waters, then that nation which has the waters under its control can make the exception. But let us make a Rule which, as the gentleman from Norway said the other day, will be satisfactory to all nations and in all waters. I do not understand that to-day the members of the Conference from the Scandinavian nations are desirous of making any alterations for their own internal waters. They want a law that will cover all navigable waters.

Mr. Hall (Great Britain).—Mr. President, I apprehend that there is really no difference between the learned Delegate from the United States and myself. We think it is most desirable to have a general Rule with regard to fishing-vessels; but what I am pointing out is whether or not it will be necessary for us to deal with the local Rules applying only to portions of the coast of Europe north of Cape Finisterre. The beginning of Article 10 makes it applicable, as you will see, to fishing-vessels, and I agree with the Delegate who has just addressed the Conference that it is most desirable to have a Rule which will govern fishing-vessels throughout the world, where there are no local Rules. I say, by all means let us frame general Rules with regard to fishing-vessels which will bind every country in the world; but is it worth our while to endeavour to settle local Rules for the coast north of Cape Finisterre? I think that we are both really agreed upon that point. Let us frame a general Rule with regard to fishing-vessels, and leave out all exceptions with regard to Cape Finisterre, or Newfoundland, or Japan.

Captain Sampson (United States).—Mr. President, I would like to ask the learned Delegate from Great Britain if he would not consider it an unfortunate circumstance if this Conference adopted Article 10 and made it a general Rule; and another Conference were to adopt Rules which should apply to the Atlantic north of Cape Finisterre, which, in themselves, should be just as general, and which should, apparently, come under Article 10, as much as fishing-vessels in any other part of the world?

Mr. Hall (Great Britain).—Mr. President, you will see that this is confined to the coast of Europe north of Cape Finisterre. It is only confined to coasting-vessels. That would not apply to vessels fishing out in the Atlantic. It applies only to vessels of this particular class. I am only endeavouring to point out that these are merely local Rules, and have nothing whatever to do with the Regulations for Preventing Collisions at Sea.

Mr. Goodrich (United States).—Mr. President, every Rule which we adopt should apply to the whole world.

Dr. Sieveking (Germany).—Mr. President, I beg to give notice of an amendment which I intend to propose with reference to the beginning of Article 10.

Article 10 applies to open boats and fishing-vessels of not less than 20 tons net registered tonnage, and it gives them a certain advantage as to carrying lights. It provides that they shall not be obliged to carry side-lights, "but every such boat and vessel shall, in lieu thereof, have at hand a lantern with a green glass on the one side and a red glass on the other side, and on approaching to or being approached by another vessel, such lantern shall be exhibited in sufficient time to prevent collision, so that the green light shall not be seen on the port side, nor the red light on the starboard side." Now, the intention of our amendment is to extend this advantage a little further in one direction, and to limit it in another direction. We think that what is said here about open boats and fishing-vessels of a small size only should be extended to all boats of this sort, small craft, not to open boats only and fishing-vessels, but to all vessels which have not a larger size than a certain tonnage. We thought that we would propose that it should be at 14 tons gross registered tonnage. The principle is this: we think that all vessels above a certain tonnage, say, upwards of 14 gross tonnage, should be considered as able to carry the side-lights as they are prescribed, subject of course to the proviso of Article 7, which allows any boat, if they cannot be fixed, to show them only. "All

vessels," whether open or decked, whether boats or fishing-vessels, which are under a certain tonnage, say, 14 tons, should be allowed to make themselves distinguishable by showing a white light only.

I have been told that this system of having a lantern with a green glass on one side and a red glass on the other side does not sufficiently answer the purpose; that in bad weather, in a heavy sea, it is scarcely possible for a man in these small vessels, and in which the crew consists of but few hands, to hold these lanterns in a way so as to avoid a mistake. It is clear that, if a vessel is tossed about and the man is not able to keep a firm standing or footing, then mistakes may occur in consequence of his having only one lantern with a red glass on the one side and a green glass on the other side. On the other hand, it has been said that in olden times these small vessels generally used to distinguish themselves by showing a white light on approaching another vessel, or on being approached by another vessel. Now comes the question of expense also for these small boats, and whether it would not be too much to require this small craft to be provided with lanterns like those mentioned in Article 10.

These are the reasons which have led us to propose this amendment, which, with the permission of the President, I intend to give in to be printed, and which I beg to read:—

"Boats and other vessels of less than 14 tons gross registered tonnage, whether under way or not, shall not be obliged to carry the lights required for other vessels; but if they do not carry such lights, they shall have, ready at hand, a lantern showing a bright white light of at least 12-candle power."

This does not make it obligatory upon them to show the white light.

Mr. Hall (Great Britain).—Mr. President, I think that all the members of the Conference will be agreed that it would be out of the question to attempt to compel every craft, however small sh may be, if she was on the high seas, to carry the same lights prescribed for ordinary vessels under Article 3, because it is clear that small vessels like small steam-launches could not carry these side-lights which would show at least 2 miles distant. It was for that reason that we thought we could obviate all that difficulty, under the Rules as they stand now, by using the epithet "sea-going steamship." A steamer like a steam-launch, or a vessel of that sort, would not come within the purview of Article 3, and therefore she would not have to carry the large side-lights, which she obviously could not carry. But it will be necessary to consider how it should be done, whether by excepting all these small vessels, or by an exception to Article 3, which I think would, perhaps, be more convenient than putting it into Article 10.

Now with regard to the suggestions which the learned Delegate from Germany has just made, that such small vessels shall carry a distinguishing light. Again we shall be confronted with the difficulty of being able to devise some distinguishing light. I have no doubt that he will find, turning to the Rules for Fishing-vessels, which are found on p. 18 of the English copy, that he will find that a trawler, when she is not fast to a rock and not stationary, has to carry a white light in a globular lantern, but also she is to fire or give some signal with a pyrotechnic light on the approach of a vessel. So that here, if the suggestion be adopted, we would have the same light that we have for a trawler, a fishing-boat, and all small vessels under a certain burden.

There is also this to be pointed out, which I think should be borne in mind during our deliberations here. There are now very fast launches designed which navigate inland waters, which certainly, in my opinion, ought to show something more than a white light. They go at a great rate of speed, and I think there should be something to warn the officers in charge of large vessels, when they see a light approaching them that it is not merely a fishing-vessel or a pilot-vessel, but that it may be a steam-launch which is travelling at the rate of from 20 to 22 knots an hour. I think there ought to be something on that point.

I do not want to increase the difficulties that we have here, but I have deemed it necessary to include in the word "steam-ship" a vessel propelled by electricity or naphtha or hydraulic power. In fact, I think we shall have to include in the word "steam-ship" all vessels worked by machinery, because unless we provide for that we shall have electric launches and naphtha launches not compelled to carry any light at all.

Mr. Goodrich (United States).—Also in that connection, Mr. President, I think the simpler we can make the lights the better it will be. I do not know that this is practicable. Some Delegates want a distinguishing light for a pilot-vessel. A good many wants what my friend from Great Britain wants, a special light for a small naphtha-launch or a steam-launch. The difficulty is going to be that the sailor is going to have so many lights that he will never remember them. If there could be a system devised by which the present lights could be kept and no others used, if that be within the bounds of possibility, I think the Conference ought to adhere to that proposition. I suppose, from what the learned Delegate from Great Britain has said, that some of these launches would hardly be able to carry the large lights. Then why not make a smaller light of the same kind for them? The time is coming—and that is a matter which we have got to consider—the time is coming, or has come, when the whole system of lights must be changed so far as their power is concerned. I am not speaking for the instruction of the nautical Delegates, who know a great deal more about this than I do, but for the purpose of waking up the press' attention to it. When these Rules were made, or the Rules of which they were the offspring, in 1863, a vessel going 10 to 12 miles an hour was a pretty rapid ship. Now they go twice as fast. The gap between two vessels closed then at the rate of a mile in three minutes, and now that gap closes at the rate of a mile in a minute and a half; and lights which would have been a warning to a vessel 3 miles off or 2 miles off then, will not do to-day. Of course there are difficulties in prescribing that a standard lamp shall be used, because, perhaps, the best lamps to-day are patented lamps, and we cannot afford to advertise any patents here, nor be a party to a scheme which will put up any one lamp, good though it be, to the exclusion of the others.

We might have to come to the proposition that vesse.s above a certain rate speed may carry a certain character of lamp, not of colour or of position, but of power. We might require a large lantern on a large steam-ship or a large vessel, while a little steam-launch could have an ordinary hand lantern, which certainly she could stagger under. But these are questions which come quite *à propos* to what has been discussed here about these lights. In all discussions and amendments which may be made upon these Rules, I hope we shall come to the conclusion that the present lights shall be unchanged, even though new lights are added. I do not see why these lights are not sufficient, except as to power, as they are written in the Code to-day.

Captain Bisbee (China).—Mr. President, I would like to ask if it is not within the knowledge of the nautical men here present that steam-launches do, at the present time, carry the regulation red and green lights. They certainly do on the Shanghae River. There is no difficulty in their carrying them.

Captain Malmberg (Sweden).—Mr. President, I may state, also, that in Sweden every steam-launch has to carry the same kind of lights as are mentioned in the Regulations. They are only of a smaller size. They carry them now just in the same manner as they are carried on the largest ship in the world, except that they are of a less power.

Captain Bisbee (China).—Mr. President, small launches are not used to any great extent now. The tendency now is to increase their size. When they began to use steam-launches in the waters I speak of, they were, perhaps, 30 feet long. There is, perhaps, scarcely one built now which is under 50 feet, because they want increased speed, and they have to carry the regular light. I have one belonging to my own office, and it is 50 feet in length, and we always carry the regular lights.

Mr. Hall (Great Britain).—Mr. President, I will say that in England the launches also carry side-lights, but they are not the regulation side-lights. But you cannot make Article 3, which provides for a side-light applicable to a distance of 2 miles, applicable to small steam-launches, because they could not carry a light large enough to give that range. It may be met, as the Delegate from the United States suggests, by providing a certain scale of lights for vessels below a certain tonnage.

Mr. Garde (Denmark).—Mr. President, we do not think that open boats should be included in Article 10 together with fishing-boats. It may not be possible to carry out a Rule in regard to fishing-vessels which can properly be termed international, and then it must be left to the different nations, at least in some parts of the world, to establish special local Rules for fishing-boats. I do not think that open boats should be included under this head; whereas it would be advisable to mention open boats in Article 7, which deals with small vessels in bad weather. I do not include steamers, but only sailing-vessels under a certain tonnage, of either 14 tons gross tonnage or 20 tons net. I suppose that it would be preferable to have a gross tonnage as the limit. It might do to say that such small vessels shall only have a lantern ready to show when there is danger of collision, as mentioned in Article 10. In this manner Article 10 would be apart from the general Rules for sailing-vessels and boats, and it would only be for the Conference here to examine whether it is possible or not to come to an International Rule for fishing-vessels. I coincide in my desire with the American Delegate, that the Rules for fishing-vessels should be international as well as all other Rules; but I am inclined to believe that it is not possible to carry out an International Rule for fishing-vessels for the whole world. We have in our country very small boats, and they have in Norway, especially to the north, very large open boats. I believe they come up to as high as 50 tons without a deck, and they are in such remote parts of the country that I do not believe it is possible for them to carry out any International Rule which might be agreed upon here; and I suppose that similar cases may be found on the American coast and elsewhere.

I would propose that we should try to come to an agreement about fishing-vessels, in so far as an International Rule can be established to be carried out everywhere, and then leave to every Power the right to establish local Rules for their own locality, in agreement with the neighbouring nationalities interested in the question in that part of the world. I cannot form any proposition at present, but I will submit it as a principle which I recommend should be followed, and afterwards I may, perhaps, submit it to the Conference.

Captain Mensing (Germany).—Mr. President, I beg leave to explain in a few words an expression which has been used here for the first time in the German Resolution that we propose to move, and that is in regard to the candle unit, which is mentioned as the standard. I want simply to state that there are, so far as I know, two units in existence. The standard Colza lamp, which, so far as I know, has been used in France and a great many of the Latin nations, is one that consumes 40 grams of Colza oil in one hour when the wick is 2 centim. in diameter. The standard candle-power which is used in Great Britain and Germany is the common sperm candle, or common stearine or paraffin candle, with one wick, consuming 120 grams an hour. The ratio between these two standards, the candle and the Colza lamp, is not absolutely sure. By some authorities it is given as being nine and six-tenths standard candles to one Colza unit. Other authorities give it as eleven and one-half standard candles to one Colza unit. Now, what has been proposed here is twelve standard candles. I do not think that the German Delegation would like to be bound within any very narrow limit to this power, but the idea is that this white light shown by fishing-vessels should be one that is about equal in power with the Colza light. The Colza lamp, as I stated before, is one consuming about 40 grams of Colza oil. I think, from my experience, that it will be very easy to construct a lamp that would consume only 20 grams an hour: that is to say, that would use in ten hours only about 200 grams, or four-tenths of a pound of oil, during the night, and that would give the required strength mentioned in this proposition. I think that such a light would be seen farther than the one that we have at present.

I would like to mention here that Article 10, as we have proposed it, is the same in effect as that now proposed. Our Article 10 differs from the one that is used by Great Britain and other nations, because we have found it impossible to carry it out in our German waters, and therefore we have altered it in about the same manner that we have adopted it here.

The President.—Pending any further suggestions or amendments in regard to Article 10, amendments to past Articles are now in order.

Captain Richard (France).—Mr. President, I desire to offer an amendment to Article 6 of the Rules regarding the precautions to be taken against collisions at sea.

My amendment is as follows:—

To Article 6. "Every sailing-vessel under way must carry such lights as are indicated by sections (*b*) and (*c*) of Article 3, with reference to steamers under way.

"They shall carry, furthermore, at the head of the foremast a white light."

I would ask permission to explain briefly my amendment.

Whenever a sailing-vessel is met at night on the high seas, and especially in bad weather, she is a source of danger from the fact that she is not obliged to manœuvre, but continues on her way; and although the red and green lights required by these Rules must be carried, it is not always certain that they will be seen, inasmuch as they may be hidden by the sails.

These red and green lights, which, according to our Rules, are presumed to be visible at a distance of 2 miles, cannot always be seen at that distance; and there is no doubt that in spite of all precautions, and in spite of all the conveniences that have been provided, mistakes are frequently made.

In England particularly I know many provisions have been made by the Board of Trade, and many precautions taken, and many conveniences provided—I do not know if the same measures have been adopted as strictly in any other countries—but in any case I know that collisions are still frequent.

My learned colleague from Germany has let fall some words upon this subject which have struck me forcibly. He has said that the white light is the signal of danger, and we know that there is nothing more dangerous at sea than a sailing-vessel. That is why I have thought fit to make this amendment. I am not very sure about the wording of the Article, but I am quite certain that the discussion must bring about some understanding; at all events I believe the thing is possible.

Then, again, much depends upon the position in which you place the lantern and the manner in which this white light is shown. It seems to me that a sailing-vessel should be better lighted than any other, in order that she might be distinguished at a greater distance, because the danger is greater. She should, therefore, carry a more powerful light. And while the red light or the green light may not always be understood, the white light, being the true signal of danger, is placed on the highest part of the ship; and I believe that the use of that light is the only certain means of avoiding collisions.

I am aware that the motion which I make has its inconveniences and is open to objections, inasmuch as it may have the effect of working a change in regard to other Articles touching upon the relations of steam-ships and sailing-vessels. But I believe it to be very advisable that the Conference should take cognizance of the question.

With these few considerations, I ask that my amendment be printed and distributed among the honourable Delegates.

Admiral Sir George Nares (Great Britain).—Mr. President, may I make one observation, which is not at all of a controversial nature, with regard to what my friend and colleague, Captain Richard, has said? He wishes, as I understand, to have the white light given to sailing-ships. I only wanted to call his attention, and also the attention of my brother seamen, to the fact that even on dark nights the sailing-ship under sail is far easier seen than a steamer.

Captain Settembrini (Italy).—Mr. President, I wish to call the attention of the Conference to Article 11. Article 11 says:—

"A ship which is being overtaken by another shall show from her stern to such last-mentioned ship a white light or a flare-up light."

Now, it may be very often the case on board a ship that the officer of the watch sees that he is overtaken by another ship and exhibits a white light, which is to be shown astern, to avoid danger. The white light is not very easily to be found. The lamp is not at hand, or, if it is to be found, there is some time lost. So I consider that this white light must be fixed on the poop or taffrail. The white stern-light is just as important as the coloured side-lights; and for this reason I propose that Article 11 should be stricken from the place where it now is and be incorporated in Article 3 and made subsection (*d*), running in this way:—

"On the stern a white light, so constructed as to show a uniform and unbroken light over an arc of the horizon of twelve points of the compass, so fixed as to throw a light from astern to six points on the port and starboard sides, and of such a character as to be visible on a dark night, with a clear atmosphere, at a distance of at least 2 miles. Such light shall be carried as nearly as practicable on the same level as the side-lights."

Then subsection (*d*) would become subsection (*e*), and would run in this way:—

"The said green and red side-lights shall be fitted with inboard screens projecting at least 3 feet forward from the light, so as to prevent these lights being seen across the bow, and the white light shall also be fitted with screens so as to prevent the light from being seen forward of these points."

The consequence of this is to bring an alteration to two other Articles. They are very slight alterations. In Article 6, where it says that "a sailing-ship under way or being towed shall carry the same lights that are provided by Article 3 for a steam-ship under way, with the exception of the

white light, which she shall never carry." In this case I think it must be corrected to read, "with the exception of the masthead-light, which she shall never carry," because a sailing-ship is obliged to carry always a white stern-light. Now, for the small vessels, as they are allowed to keep the side-lights inside of the ship or on deck, ready for use, so they should also be allowed to keep the white stern-light ready for use, and Article 7 should be, according to my opinion, corrected so as to read:—

"Whenever, as in the case of small vessels during bad weather, the green and red side-lights and the white stern-light cannot be fixed, these lights shall be kept on deck on their respective sides of the vessel ready for use, and shall, on the approach of or to other vessels, be exhibited on their respective sides in time to prevent a collision," &c.

Then to the last paragraph, where it says: "In such manner as to make them most visible, and so that the green light shall not be seen on the port side, nor the red light on the starboard side," there should be added, "nor the stern-light from the forepart of the ship."

The President.—Will the Delegate from Italy please embody that as an amendment and hand it to the Secretary?

Mr. Hall (Great Britain).—Mr. President, I quite agree with the gallant Delegate from Italy as to the importance of this stern-light. We have found that it is of the greatest assistance. We think there should be no dispute between the gallant Delegate from Italy and ourselves as to the necessity of that light being shown. The only criticism I should venture to make upon what he has proposed is this, that it, of course, would involve, as he has stated, the alteration of two or three of the other Rules.

Now, I cordially agree in what has fallen from the lips of the learned Delegate from the United States as to the desirability of framing these Rules so as to alter the lights as little as possible. I think that we are strongly of the opinion that the multiplication of the lights is to be avoided as much as possible. I think that any one who has studied the progress of Sea Rules as they have been framed will see that the idea has always been to have a uniform system of lights, but gradually exceptions have crept in to distinguish, for instance, fishing-vessels and pilot-boats, &c., and they have crept in without the intention of interfering with the main Rule.

Now, with regard to the proposition that the stern-light should always be carried, making it in fact a fixed light and incorporating the provision in Article 3, I think we ought to remember this—I know it would be no hardship upon large vessels, but it would be rather a tax upon small craft which ply about the coast, certainly, to impose this upon them—the stern-light is only used by them sometimes once in several months. It is not like the side-lights, which are used at every hour and almost every moment of the night by vessels which are being met; but it only has to be shown in rare cases where they are being overtaken in such a manner that there is risk of a collision. Then they are allowed to hang this light out and show it. We have found in practice in Great Britain that large ships do carry a fixed light such as this, but there is no doubt that if a steamer is carrying a fixed light like this, with the Rules in the present shape, that it would be contravening the Rules, because she is carrying a fixed light not provided for by the Rules. Therefore, she would be to blame for having exhibited a wrong light. By the present Rules she has merely to show it when she is being overtaken; but there can really be no objection to her carrying it as a fixed light. Therefore, we propose to make it optional with a vessel to have a stern-light fixed if she likes, and if she does, she must have it fixed as nearly as possible at the same height from the water as the side-lights.

The amendment about which I am about to give notice is merely to carry out that idea and make it allowable for vessels to have their stern-lights fixed if they choose. We propose to add to Article 11 the following:—

"The white light required to be shown by this Article may be fixed and carried in a lantern, but in such case the lantern shall be so constructed, fitted, and screened that it shall throw a uniform and unbroken light over an arc of twelve points, that is to say, for six points from right aft on each side of the ship. Such light shall be carried as nearly as practicable on the same level as the side-lights."

I think that there is no doubt but that the gallant Delegate from Italy and ourselves will be able to arrive, by discussion, at a medium or mean between us.

The President.—That is rather an important question. Will you be kind enough to make it in the form of a Resolution?

Mr. Goodrich (United States).—Mr. President, while my learned brother is formulating his proposition in connection with the subject which the gallant Delegates from Italy and Great Britain have called to the attention of the Conference, Captain Norcross, of our Delegation, suggests that the white light, as required in Article 11, shall be fitted with the slip-screen, to be only removed when being overtaken by another vessel, which suggestion I should like to hand to the Delegates who are formulating that Article as a very thoughtful suggestion which may be of great service.

Mr. Verney (Siam).—Mr. President, before we pass from the discusion of the subject of lights, I would like to throw out as a suggestion to the nautical members of this Conference the following proposition. I cannot claim, as many of the gentlemen who are present can claim, practical experience in the matter which will guide me in arriving at a proper conclusion; but as one who has carefully listened to the discussion I have ventured to put down on paper what seems to be a very general opinion:—

"As the danger of collision has come to depend much more on the speed of approaching vessels than on any other consideration, the lights to be carried on any steam-ship under way shall depend on the maximum speed of such ships, and the intensity of the light to be carried shall be expressed

by some grade or unit of measurement, and shall have some reference to the maximum speed of the steam-ship which carries them."

I do not venture to trouble the Conference with any explanation of that, because it seems to me that the explanation of that Resolution has already been given by other members of the Conference who have before spoken.

Captain Sampson (United States).—Mr. President, I propose this Resolution, without advocating it in any way whatever, but simply, as I stated before, to obtain the sense of the Conference on this question :—

"*Resolved*,—That white range-lights be substituted for the present coloured running lights, or that they be used in conjunction with such coloured lights."

The President.—The Resolution contains two propositions, which should be offered separately, as some of the Delegates might vote in favour of the second who would not vote in favour of the first.

Captain Sampson (United States).—Mr. President, it is written "or." It is simply to get the opinion of the Conference as to making any change at all.

Mr. Goodrich (United States).—Mr. President, I want to suggest, in connection with the Resolution or expression of opinion of the learned Delegate from Siam, one practical difficulty which occurs to a theoretical seaman. The Delegate proposes a light graduated to the maximum speed of the ship.

Mr. Verney (Siam).—Not quite that; but to have some reference to it.

Mr. Goodrich (United States).—Then, if the steamer reduced her speed, you would have to have an automatic machine, like the governor to a steam-engine, to regulate the intensity of the light.

Mr. Verney (Siam).—No, Sir; because I consider that there would be no objection to her carrying a maximum light. I do not, in any way, propose that the steamer should reduce her light as she reduces her speed. Perhaps I have worded it awkwardly.

The President.—Will the Secretary please read the Resolution presented by the Delegate from the United States?

The Secretary read as follows :—

"*Resolved*,—That white range-lights be substituted for the coloured running lights, or that they be used in conjunction with such coloured lights."

Mr. Hall (Great Britain).—Mr. President, I do not know whether it is suggested that the Conference should be asked to express an opinion upon that at the present time, or possibly to-morrow morning. I will point out this. It is clear that any intention to support such a motion would require careful consideration. I apprehend really that the object of it is to elicit the opinion of the Conference as to whether or not it is desirable, as was suggested by Delegate Goodrich, to confirm the principle that it is undesirable to interfere with the existing lights which are used on board ships. Of course, I can only speak of the result of what is told me by my colleagues, who have had very great nautical experience. But so far as I can judge, the overwhelming preponderance of opinion among sailors is that it is desirable to adhere to the existing system of lights, which have been used now throughout the world for so many years, and which are known upon the sea. If it be the intention of this Resolution, as I apprehend it is, to clear the way for future discussion, by at once confirming the principle that the present system of side-lights and the masthead-light be adhered to, that will, no doubt, save the time of the Conference, and I would willingly vote with my colleagues in support of that proposition. I might, perhaps, suggest to the gallant Delegate for the United States whether or not a Resolution in converse terms would not signify more accurately the sense of the Conference, a Resolution, perhaps, in such words as, "that in the opinion of the members of this Conference it is desirable not to depart from the present system with regard to the coloured lights and masthead-lights for vessels at sea." I would suggest that this would confirm the principle more distinctly than to put it in the negative way in which he has framed it. I think it would point more distinctly to the object in view. It seems to be almost the unanimous opinion that the Conference should adhere to the present principle and use the coloured lights and masthead-light.

Captain Sampson (United States).—Mr. President, I only propose the Resolution to obtain the sense of the Conference to decide the question. It is to be noticed that the Resolution contains two propositions, first to do away with the coloured lights, or to use them in conjunction with the range-lights. This method of using range-lights is already in existence in some parts of the world, and I know that it would be strongly advocated by those who have had the experience. I do not wish to commit myself in regard to it.

The President.—As there are two propositions, it would be well to have them written out separately. It is difficult to have an intelligent vote upon both at the same time.

Mr. Goodrich (United States).—Mr. President, I have prepared a Resolution, at the suggestion of Delegate Hall, and following the intimation given by the Chair. If it should turn out that the Conference is prepared to vote instantly on it, as, to use a Yankee word, I "guess" they are, it may clear up the entire matter :—

"*Resolved*,—That, in the opinion of the Conference, no change should be made in the use of the present masthead-light and coloured side-lights."

This does not touch the question of additional range-lights.

Mr. Hall (Great Britain).—Mr. President, I think that had better be the subject of another Resolution, which we can debate at considerable length before we act on it.

Mr. Goodrich (United States).—This you are probably prepared to act on at once.

The President.—The Delegates might desire to think of it during the recess.

Mr. Goodrich (United States).—Mr. President, I move the Resolution be adopted.

The President.—Do you present this as a substitute for Captain Sampson's Resolution?

Captain Sampson (United States).—Mr. President, I will withdraw the Resolution offered by me.

The substitute was put by the Chair and unanimously adopted.

Mr. Goodrich (United States).—Mr. President, something has been said about appending, to some portion of these Rules, definitions. I propose this for future discussion:—

"*Resolved,*—That the words 'starboard the helm' shall mean that the wheel or tiller, the rudder, and the bow of the vessel are to be turned to starboard; and the words 'port the helm' shall mean that the wheel or tiller, the rudder, and bow of the vessel are to be turned to port."

You can work your tiller by a reversible joint. That is a mere technical contrivance, but I put it in the broad sense that the wheel, rudder, tiller, and head shall go to starboard when you say, "starboard your helm."

The President.—That is not in order.

Mr. Goodrich (United States).—Mr. President, it is one of the definitions; we have passed the Article.

Mr. Hall (Great Britain).—Mr. President, might I suggest to the learned Delegate of the United States that it would be better if he would bring this forward when we come to the Division on Steering and Sailing Rules, where the expressions are used? I can quite understand the desire of the Delegate to bring this before the Conference. We know that difficulties have arisen from the use of the words "putting the helm to starboard" and "putting the helm to port," because in some countries, if it is literally translated, it would be putting the head of the ship to starboard or the head of the ship to port.

Mr. Goodrich (United States).—I thought it would come properly into the definition, but I do not know but that you are right.

The President.—Article 11 is still under consideration.

Captain Van Steyn (the Netherlands).—Mr. President, I am very much in favour of the stern-light, just as large steamers now use it, and therefore I suggest that Article 11 should be amended by adding the following:—

"Every ship exceeding 20 tons registered shall carry on her stern, and at the same height as her side-lights, an irregularly occulting white light, so screened that it shall be visible over an arc of twelve points, that is to say, for six points from right aft on each side of the ship, and at a distance of at least 1 mile."

The President.—The Conference will now take a recess until 2 o'clock.

After Recess.

The President.—The first business in order is the consideration of Article 12, "Sound-signals for Fog," &c.

The Chair desires to state that there will be a large amount of literature on this subject placed before the full Committee, and in discussing this Article it would be well to bear that in mind.

Mr. Verney (Siam).—Mr. President, may I ask when it is that these Committees will sit? Will it be during the time devoted to the general business of the Conference, or will it be out of hours?

Captain Malmberg (Sweden).—Mr. President, for my part I am strongly opposed to sitting in special Committees out of hours.

The President.—That will be a matter for the Conference to decide. I think that perhaps it would be imposing too much upon the members of the Committee to require them to sit out of hours and to sit here on the same day.

Captain Malmberg (Sweden).—Mr. President, there are two Committees, and there will not be many Delegates left during the time that these two Committees are at work. They will be at leisure to do anything they please.

The President.—The Chair is ready to entertain any proposition in regard to that.

Captain Sampson (United States).—I think, Mr. President, that if it is decided that these two Committees are to occupy the time which has been set aside for the Conference, it would be well for us to give them an opportunity to get their work up, because the propositions which are made with regard to fog-signals, I think, are very important, and there are probably several of them that would be favourably entertained by the Conference. I think we ought to know what they are before we go ahead and discuss the subject.

The President.—There might be suggestions coming from the Conference at first, and then suggestions coming from the Committees afterwards. The Chair is ready for any motions upon the subject.

Mr. Goodrich (United States).—Mr. President, of course I am quite aware of the extra burden that will be inflicted upon these Committees by sitting out of hours, but the distinction which they receive in being members of these Committees ought to compensate them for the extra burden. I take it that these are not the only Committees which will be appointed in the course of our Conference. Many other Committees will be appointed, and they will have the same burden of sitting out of hours as the Committees already appointed have. I am sure that we want the presence of all the members

of the Conference here, especially the gentlemen who have been named on these two Committees, because they were appointed, as I understand, on these Committees by reason of their special knowledge and fitness for the position.

The Committees could sit from 10 to 11 in the morning or from 4 to 5 in the evening, and they can get through a good deal of work, and not keep the members of the Conference in America so much longer as they will be kept here if the Conference is to adjourn every time the Committees are to meet. Of ccurse it makes less difference to us who are here at home than it does to those from abroad. But while we are glad to have you as long as you will stay and honour us with your presence, yet we do appreciate the feelings which some of the Delegates have in regard to getting away, especially those who wish to celebrate Christmas at home. My own opinion is that other Committees will be appointed, and that Committee work ought to be done out of hours. Of course, if there is any gentleman who thinks himself unable to do that, I will say that it would be a little unfortunate for him, and yet that, for the good of the whole Conference, he ought to be willing to sit out of hours. This, perhaps, does not come with very good grace from me, when not a member of any Committee, but still I feel in this way.

Captain Malmberg (Sweden).—Mr. President, I, to a certain extent, agree with Mr. Goodrich, that it is a great honour to be a member of these Committees. But it is a great strain, both bodily and mentally, to be sitting here four hours a-day, and then for an hour before the sitting of the Conference and for an hour after the sitting of the Conference. It is all very well and very easy for you, Gentlemen, who speak English as your native language ; but for us who are foreigners it becomes very trying, as we must fix our attention to understand fully the discussions, and then, when we have to express ourselves, it is still more trying. It is all very well if we can get through with the business in a short time, but the time we are about it is not the main thing. The main thing is that it is done well. I say, for my part, that I wish that these Committees would not have to sit out of the working hours. I may say, at the same time, that I have not the least objection to working on Friday afternoon or Saturday.

Mr. Hall (Great Britain).—Mr. President, I quite agree with the forcible remarks which have fallen from the learned Delegate of the United States as to the desirability of our having the great assistance we shall obtain from the eminent gentlemen who have been named to serve on these Committees. I would preface my remarks by saying, like the Delegate of the United States, that I also am not nominated to serve upon any Committee, therefore my remarks may be somewhat prejudiced by that fact. But I would venture to point out this. I think it may be desirable, anxious as I am that we should be able to bring our labours to a successful termination within a reasonable time—it may be desirable that we should determine, for instance, that one day, say Wednesday, should be given up to the Committees. Of course a small Committee can get through the work very much more rapidly than the Conference sitting together. That day would not be wasted, because the various Delegates could be considering their votes and the discussions on the amendments which have been proposed. I have no doubt that as we warm to our work we shall require considerable time to consider the more important amendments and suggestions which have been made by the various Delegates to the Conference. Therefore, if we were to make Wednesday a *dies non* as regards the sitting of the Conference, the Committees then would have that day. They would also have Friday afternoons and Saturdays, and I think they would then be able to cope with their work sufficiently to enable the Conference to go on and sit successively on the other four days of the week. It is perfectly true that we should lose one day by that, but I believe the work which we would be able to do amongst ourselves on that day would save a considerable amount of discussion when it came to a meeting of the Conference itself. Therefore, I would beg to move, what I think is in harmony with the general sense of the Conference, that Wednesday the Conference itself shall not sit, so that the day can be given to the Committees, and to such private business as the members of the Conference may think it desirable to debate.

Mr. Verney (Siam).—Mr. President, may I ask whether Mr. Hall only means as long as the Committees are at work ?

Mr. Hall (Great Britain).—Mr. President, only until the Committees have had an opportunity to present their Reports. But, as the Delegate of the United States has pointed out, we are sure to have further Committees appointed, and, therefore, I did not think it necessary to put in the saving clause.

Captain Norcross (United States).—Mr. President, I would further amend the motion of Delegate Hall. It seems to me that one day would give a very short time to the Committees to work in. I would suggest that the Conference should adjourn for Wednesday and Thursday both.

Mr. Hall (Great Britain).—Mr. President, perhaps I might say a word or two upon the amendment which has been moved. I can quite see the desirability of the Committees having ample time. I am sure that none of us underrate the importance of the subject they have to discuss and the very voluminous papers which will be submitted to them for their decision. But, at the same time, if the amendment be adopted it narrows the time still more in which the Conference can proceed to general business. That would only give us two and a-half working days in the week, which would be very little to cope with the work which we have to do.

Captain Norcross (United States).—Mr. President, it was merely a suggestion on my part. I do not think it will take up our time, for I am under the impression that our work could be more rapidly performed by Committees than in the Conference.

Captain Richard (France).—Mr. President, I propose as an amendment to the motion of the learned Delegate from England, Mr. Hall, that the Conference sit from 10 o'clock in the morning until noon each day, and that the afternoons be devoted to the Committees.

When the Committees shall have been formed, the Conference will probably have less to do, and may be able to finish its business, with sufficient reflection, by sitting two hours in the morning, and so allow the Committees to sit in the afternoon.

The President.—Does the Delegate from France insist upon his amendment?

Captain Richard (France).—No, Sir; I do not.

The President.—The Delegate from France suggests that instead of the system proposed we should sit in the morning in Conference, and that the afternoons should be devoted to the Committees.

Mr. Verney (Siam).—Mr. President, I would venture to suggest to the Conference that under the suggestion made by the learned Delegate from Great Britain we should practically have two days as Captain Norcross suggested.

Captain Norcross (United States).—Mr. President, I withdraw my amendment.

The President.—The Delegate from the United States withdraws his amendment. The motion of the Delegate from Great Britain is before the Conference.

Mr. Hall (Great Britain).—Mr. President, I desire to make a suggestion. Of course our object is to consult the convenience and wishes of the Delegates. I think we are hardly in a position to come to a vote upon this Resolution at the present time. I think it would be better that we should discuss the matter informally amongst ourselves and find out what is really best suited to the wishes and requirements of the gentlemen present; and if we postpone this rather important point until morning more can be accomplished. We shall then be able to discuss it amongst ourselves and find out what is essential to the Conference. I am certain that we want to do that which is consonant with the wishes of the majority of the gentlemen here. We shall be able to decide upon that better to-morrow.

The President.—Does the Delegate from Great Britain withdraw his motion?

Mr. Hall (Great Britain).—I withdraw my motion.

The President.—The consideration of Article 12 is in order.

Captain Van Steyn (the Netherlands).—Mr. President, may I ask if we understood correctly that we were to go through with all these Articles?

The President.—Have you an amendment to Article 2 which you desire to offer?

Captain Van Steyn (the Netherlands).—We have not fully discussed Article 2. I thought the understanding was that we should go through all the Articles and then come back to Article 2.

The President.—The understanding is that after the Articles have all been gone through with they are to be taken up with their amendments and disposed of the second time. Article 2 will come up again for discussion. Do you wish to make an amendment to Article 2?

Captain Van Steyn (the Netherlands).—Yes, Sir.

The President.—Do you wish to hand it to the Secretary? That will be in order. You may make the amendment and make any remarks you desire on the amendment.

Captain Van Steyn (the Netherlands).—Mr. President, Article 2 reads now: "The lights mentioned in the following Articles, numbered 3, 4, 5, 6, 7, 8, 9, 10, and 11, and no others, shall be carried in all weather from sunset to sunrise." I would add to that the words, "which can lead into error." So that it will read: "The lights mentioned in the following Articles, numbered 3, 4, 5, 6, 7, 8, 9, 10, and 11, and no others which can lead into error, shall be carried in all weather from sunset to sunrise by ships exceeding 20 tons registered tonnage."

Mr. Hall (Great Britain).—Mr. President, before we proceed to the discussion of Article 12, I beg to give notice of a new Rule which we propose to insert, and which you will find printed as Article 13, in italics, in the left column. Before I read it I beg to state what the object of it is. It has been pointed out, during the sittings of the Conference, that, of course, the Rule is rigid that a vessel may only show the lights prescribed by Article 3, and no others. It is often the case that a sailing-vessel may have her lights obscured, and she wants to attract the attention of another vessel. The gallant Delegate from France proposes that she should carry a masthead-light, but that, of course, would give no distinction between her and a steamer. So we propose to meet the same difficulty, which was so ably pointed out by the gallant Delegate from France, by providing that a sailing-vessel should be at liberty to show either a flare-up light or use a detonating signal, which would call the attention of the vessel approaching her, if the vessel was approaching her forward of the beam. Of course, if the vessel was approaching her from aft, she could show her stern-light; but in case she is afraid that the steamer which is approaching her on either bow or ahead has not made her out, either through her light being obscured by the sails or something else, she is then to be at liberty to show a flare-up light, which, at the present moment, she is not entitled to do. Therefore, we propose a Rule to be headed:—

"*Lights and Signals to attract attention.*"

The heading should be printed in the new Rules. The Rule is:—

"Every ship may, at any time, in addition to the lights which she is by these Regulations required to carry, show a flare-up light, or use a detonating signal to attract attention."

Captain Richard (France).—Mr. President, I am of opinion that the motion of the learned Delegate from Great Britain will not fulfil the requirements of the amendment offered by me this morning. The objection to these flare-up lights is this: that they last but for an instant, and at that instant it is not improbable that the attention of the other vessel may be turned in another direction.

I endeavoured to explain some of the uses of the white light at or near the truck on the foremast, and one of these is that it indicates the direction of the ship. From the red light or the green light it is impossible to say in what direction a vessel is going in a sufficiently approximate manner, and the white light would assist in determining that direction.

The result to be obtained by the motion will not be the same as that which I desired to obtain in making my remarks upon this subject this morning.

I apprehend, to resume, that a light at or near the truck on the foremast has another advantage, viz., that of giving an idea of the direction of the sailing-vessel, or an approximate idea, and this is important, because the watch officer on the steamer does not know exactly the direction of the wind, but only the result of the velocity of the wind and of the speed of the vessel.

Mr. Goodrich (United States).—Mr. President, I move to proceed to the consideration of Article 13.

The President.—If there be no objection, we will proceed to the consideration of Article 13.

Mr. Hall (Great Britain).—Mr. President, I have some amendments to make to Article 12, which we have not dealt with yet. Perhaps it would be convenient if I would state briefly the propositions which I make on behalf of my colleagues and myself in regard to Article 12. We have found that the duration of time of signals to be given in a fog was not stated. We have found, as a matter of practical experience, that is is very difficult to get sailors, and men especially who have not had a good education, to tell what is meant by the words, "a long blast or a short blast." Of course you cannot expect a man to stand with a chronometer before him or with his watch in his hand to determine upon the time, but we have thought it desirable to give some approximate duration as to the meaning of the word "long" as distinguished from the word "short." So we propose, instead of the words, "a prolonged blast," at the end of subsection (*a*), the words, "a long blast of about four seconds' duration." Then we propose to put in a new subsection (*b*), which I may read to the members of the Conference. We have thought it desirable, especially in the case where steamers were meeting one another in a fog, that a steamer should be able to give a signal to another vessel which she hears in her vicinity, "We have stopped our engines and stopped our way." It is clear that a mere signal that she had stopped her engines would be of very little assistance indeed with regard to a vessel in close proximity, because if you take a vessel that is making 20 knots an hour at full speed, and she stops her engines, she carries on that speed for a very great distance. Therefore, we thought it desirable that a steamer which was being navigated prudently in a fog, and which had acted so prudently as to have stopped her engines and stopped her way, should be able to communicate that fact to a vessel which she hears, especially when we know that she cannot be certain where the vessel is from which the signal comes. So we propose to put in this subsection (*b*) :—

"A steam-ship not at anchor, but stopped and having no way upon her, shall sound, at intervals of not more than two minutes, two long blasts with an interval of about one second between them."

I have no doubt that the Secretary will notice that the word "about" is inserted in the print when I hand it in. If you say "about one second," every sailor will know what it means.

The only other amendment which we have to propose upon this Rule is in accordance with the views which have been pointed out by several of the Delegates with regard to the meaning of the words "under way." We propose to substitute in subsection (*b*) of the existing Rules the words "at anchor" instead of "not under way," so as to make it clear what this signal is, and that the vessel is at anchor; because a vessel having her engines stopped with no way upon her might possibly be supposed to come under the definition of "not under way." It has been pointed out to me that I should insert "or moored," and make it read when "at anchor or moored."

Mr. Goodrich (United States).—Mr. President, at the end of Article 12, subsection (*c*), I propose to add these words, or rather to change the whole of the subsection to read :—

"A vessel when not under way shall at intervals of not more than two minutes ring the bell rapidly for not less than five seconds."

I do this in this form, although it is a little inconsistent with the suggestion of the learned Delegate from Great Britain, so that the whole subject may be brought up in its various phases. If we adopt the suggestion of the English Delegates upon the other section, a part of this will be improper. The chief point in my suggestion is in adding the words, "rapidly for not less than five seconds." Captain Norcross says that the proper words for me to use would be "ring away of the bell." I do not entirely understand the phrase. It is new to me. The point about that is that there is no instruction in any of the Rules as to how that bell should be rung by any vessel not under way, and if there was a clear instruction in this Rule that the rapid ringing of the bell at intervals of not more than two minutes should be understood as a vessel not under way, it would be an advantage. I understand there is no custom on this subject; that some toll the bell, some ring it rapidly, some slowly, some one or two strokes, and even three strokes; that there is now no universal rule or custom regarding the manner in which the bell shall be rung.

Captain Sampson (United States).—Mr. President, I would suggest that it seems to me we are hardly taking advantage of all the possibilities of protection for ships at sea about this matter of signals. The signals as laid down in the present Rules, which have been improved in the suggestions which have been made by the learned British Delegate, seem to me to admit of still more improvement by making the signals or sounds used mean something more than the mere presence of a vessel making the signal. It appears to me to be possible by a fog-signal to indicate the course which the ship making the signal is steering or is heading. If that is the case it would help the matter very much to adopt some such system of signals, which, of course, would be necessarily as simple as possible, but to have the ship making the signals by a combination of a long and short blast, or by a blast given at unequal intervals of time which should be prescribed, indicate simply that she was steering north, south, east, or west, or indicate her course within four points. In that event, the signal would be much more serviceable than it is at the present time.

Mr. Goodrich (United States).—Mr. President, it may not be out of place for me, at some length, to trouble the Conference with some views which proceed from the body which really called this

Conference into existence. I refer to the Maritime Exchange of the City of New York. I have in my hand a paper from them, a part of which I will present to the Conference. I will hand it to the proper Committee. Perhaps the opening portion of it may touch the vanity of my brother associates as it does my own, and I will read it:—

"All peoples of the earth may be congratulated upon the assembling of this august body, to act for promoting the safety at sea. In its beneficent object there is a community of interest throughout the world. Whatever the number of vessels each nation has at sea in common they traverse the ocean, not only encountering its perils, but menacing each other when moving in fog. The increased number, size, speed, and rivalry of steam-ships have largely added to the danger of collision, and all nations are interested in reducing the peril to a minimum. Whatever else the Conference may act upon, among its prime purposes is to fix upon some means, the simpler the better, by which vessels invisible to each other in thick weather may indicate the direction in which they are moving, and thus diminish the chances of collision. All other subjects before the Conference, however important, are subordinate to that of reducing to the lowest possible limit this greatest peril of the sea.

"Notwithstanding all objections to signals by sound, the fact remains that the navigator in thick weather can be communicated with through his ear only. Through hearing alone can he learn the presence or the direction of a vessel invisible to him. Therefore, until some better means, as yet unknown, be found, it seems plain that, for intercourse, signals in fog must be by sound. A prime requisite obviously are universality and intelligibleness. Uniform fog-signals should be obligatory upon all crafts in all waters open to sea-going vessels, in ports as well as at sea.

"The meaning of any signal should be instantly, fully, and unmistakably apprehensive to the hearer, whether he be a scientific navigator or an unlettered seaman."

Then comes a suggestion, as follows:—

"Many methods, more or less objectionable, have been suggested to meet the requirement. Among these are—

"1. A system of four signals for steamers in fogs. One blast of the steamer's whistle to signify that she heads north; two, an easterly course; three, a southerly; and four, a westerly course.

"This seems fatally defective. It is too easily confounded with the present perfect system of helm-signals. The hearer could not be certain whether one blast indicates a northerly course or a helm to port; whether two signify an easterly course or a starboard helm; or whether three mean that the steamer signalling is backing full speed or heading southerly. The hearer would be doubly in doubt, if apprehensive lest his vessel may have been made out by the other.

"2. Long and short sounds, in various combinations more or less elaborate. To them the same objections apply. One, two, and three blasts respectively have at least two significations, liable fatally to confuse the hearer.

"Moreover, the chances are at least equal that in a storm the ear would not distinguish between long and short blasts, or accurately determine their number. Long blasts faintly heard to windward against a gale might come to the ear as a succession of short sounds. Course-signals misunderstood would tend to increase rather than diminish the dangers of collision.

"3. Series of blasts sounded on the principle of ships' bells: one, signifying a northerly course; two, a north-easterly; two and one, an easterly course, &c. The same fatal objections apply to this. One, two, and three blasts respectively are identical with helm-signals. In many cases the hearer could not judge accurately as to the number of blasts sounded. A signal of eight separate sounds on this principle, however effective at close quarters and in a calm, might readily be misinterpreted in even half a gale as seven, six, or a less number, and provoke the collision it was designed to prevent.

"A strong objection to most plans proposed is the multiplicity of the signals."

After that comes the following:—

"In my opinion the Code should embrace but four signals, indicating respectively that the vessel sounding them is on a northerly, an easterly, a southerly, or a westerly course. Preferably, the sounds should be produced by mechanical means to insure uniformity and power—steam-ships with steam and sailing-vessels with compressed air—respectively indicating by the sound whether it come from a steamer or sailing craft. Apparatus can be carried which, by the simple turning of a crank, will make the signals automatically, and be instantly set to any course.

"Nearly all the large steamers carry two or three steam-whistles in combination. I would therefore suggest two (or three) shrill whistles or fog-horns of different tones; northing to be signified by the ascending scale; southing by the descending scale; easting by a single high note, followed by the others sounding together; and westing by all sounding together, followed by a single low note. The diagram will illustrate the Code with two signal whistles.

"To three whistles, or horns, the same principle applies (see second diagram). Northing (ascending scale) and southing (descending scale) each consist of three notes; easting and westing by two, the former commencing and the latter ending with a single note."

Then he refers to musical signals, which, I believe, we have been supplied with in the very elegant forms of a scale and picture.

After reading this I present it to the Conference as a Memorandum of the Maritime Exchange of the City of New York, to whom we are greatly indebted for the labours which they have expended in this matter.

Mr. Hall (Great Britain).—Mr. President, I should be glad to be allowed to hand in to the Conference a paper which is a Report with regard to indicating the course by sound-signals, and

which is a Report of replies made in answer to a letter which I will read to the Conference. It was thought desirable, having regard to the great importance of this subject, to get the opinions, so far as our Committee could, of all the representative bodies throughout Great Britain, and to get the opinion of men of experience in regard to this matter, because it is more a question for practical seamen than anybody else, as to the advisability of adopting more sound-signals. The Board of Trade issued a letter, which I will read in a moment, in March of the present year, and caused it to be sent to forty-four of the principal firms of ship-owners and five ship-masters and Seamen Societies. Each firm of owners was invited to obtain the opinions of six of their most experienced masters upon the questions printed in italics at the head of the letter.

I will read the letter, which is as follows:—

"The Committee are desirous of getting the opinion of real practical experienced seamen, people who know equally what is likely to be of use and what is impracticable—people on whose acts at a trying moment the safety of the passengers and the ship depend—these are the men who alone know the present difficulties and dangers, and are the best able to judge whether any scheme, however good its authors may think it to be, will add to or lessen these dangers, and we shall not proceed further in this matter until we have the opinion of these men.

"Please let me impress on the minds of your captains, through you, that the inclosed papers do not touch on the Steering and Sailing Rules, nor do they touch on the question of lights to be carried by ships; the inclosed papers touch on one point, and on that point alone are we at this moment desirous of opinions. The point is stated at the head of my letter, and is printed in italics."

The question referred to in the letter is this:—

"Is it practicable, and, if so, is it advisable, to introduce some system of course or route indicating sound-signals to be made by steam-ships under way in fogs, mist, or falling snow, when neither can see the other?"

The members of the Conference, when they see this paper, will find the names of the firms who were consulted given. I think I may say that there was not one leading firm of ship-owners in the United Kingdom which was not invited to give the result of the nautical experience of their most experienced men, and it was responded to in the manner which was to be expected of such men. They sent in exhaustive replies to the question, which were tabulated. We have got here in the Appendix the opinion given of all these men, and the results are given in a tabulated form. Of course, I do not propose for one moment to occupy the time of the Conference in a discussion as to the desirability of any proposed course in detail, but I think I should say to the Conference that whereas the proposition was before all these various bodies, the general summary of the replies is as follows:—

There were received from masters who were opposed to the introduction of any compulsory system of sound-signals, 119. From owners and Societies who were also opposed to the introduction of any compulsory system of sound-signals, 10. Masters who advocate the adoption of a few simple signals, chiefly those required by Article 19 of the Regulations for Preventing Collisions at Sea, 48; and owners only 2. Of the masters who advocate the adoption of a more complete system of signals there were only 28, and of Seamen's Societies 1 only reported in favour of it.

The chief reasons given by those who object to the introduction of any system of fog-signals are the confusion they would cause in crowded waters, the difficulty of locating sounds in fog, the false confidence they would give to officers in charge of vessels using them, and the considerable degree of skill and experience necessary to prevent the possibility of mistake in the event of any complex system being adopted. For instance, a vessel might signal that she was on a northerly course; but that knowledge would not be of very great assistance unless you could be certain how she bore. Another objection was to the false confidence it would give to officers in charge of vessels using the signals. And, lastly, the considerable degree of skill and experience necessary to prevent the possibility of mistake if a complex system was adopted. The last ground, it is obvious, no doubt, to the Conference, is one of importance. Of course, you can have the officers of the Navy taught almost any complex system. But in legislating and drawing Rules we have not only to think of them, but to think of the second and third rate officers of the small coasting-vessels, men on small coasting-vessels, men who are not of very bright and clear intellect, &c. It is for these reasons that opinions have been obtained, which I have the honour to present to the Conference, and which will be laid upon the table, and then handed to the Committee.

Mr. Goodrich (United States).—Mr. President, I might give another reason. If a vessel was approaching the one giving the signal, although she gave four signals, the approaching vessel might only hear three of them, or two of them, which would make it still more confusing. Some time in August last, in view of the approaching Conference, the Navy Department of the United States directed the trial of sound-signals to be made on the United States' man-of-war "Yorktown," and the trial was made in September. There will be printed and laid upon the tables of the members of the Conference, in due season, a Report of this. I have here the galley proof. I may say, for the information of the Conference, that there were three systems tested. The fog-signals were those by Mr. McWade, the Waldecker system, and the Folger system. Through the same source there has been obtained the trial of running lights, that of Lieutenant Fletcher, which includes the question of range-lights; the Fletcher system modified; a third system of running lights with an after range-light; fourth, the present masthead-light, and two sets of running side-lights; in other words, an auxiliary coloured light on each side; fifth, to substitute the white lights for the green lights in the proposition already given.

I will say that this will be printed and laid on the table in a very few days.

Dr. Sieveking (Germany).—Mr. President, I want to state just a few words in regard to an amendment which the German Delegation have to propose to Article 12, which only refers to small vessels and small craft. It is on the same principle that I tried to explain this morning about the advisability of not making the side-lights compulsory on vessels of a certain small size. We intend to give notice of the following amendment:—

"(*d.*) Vessels of less than 14 tons gross registered tonnage shall not be obliged to be provided with the instruments above described, but shall make with any other instrument an efficient sound-signal, at intervals or not more than two mniutes."

The same difficulties which were in the way to prevent the small craft from keeping up the regulation lights would also prevent them from giving these signals which are prescribed by Article 12. In fact, I am told that experience has shown that they are not given by these small vessels while there are other means at hand which a practical man would consider to be quite sufficient to indicate the presence of these vessels. We propose also, and it will facilitate the whole Article, to strike out the words, "to be sounded by a bellows or other mechanical means," and leave only the words, "an efficient fog-horn." We have thought it advisable to strike out these words.

Mr. Hall (Great Britain).—Mr. President, we regret what has fallen from the learned Delegate from Germany with regard to striking out the provisions that a fog-horn should be sounded by a bellows or other mechanical means, and I hope he will not press the amendment for this reason: We have found from experience that if it were left to men to blow the horn with the mouth and the men got tired, the sounds would become faint, and they really could not be relied upon at all. Therefore it was that the words, "sounded by mechanical means," were inserted, because then you have got the same volume and strength of sound at the beginning and at the end, while if a man had to blow with his mouth he would get tired or lazy, and would not give forth a sound that could be heard at any proper distance. I quite agree that some provision should be made for small vessels, which, of course, could not be provided with steam-whistles or power like large steam-vessels.

Captain Mensing (Germany).—Mr. President, I would like to reply to the question of the learned Delegate from Great Britain with regard to the fog-horn. We have found in our country that the best fog-horn is not the simplest one at all. We have found that the people on board generally take those fog-horns and use them for blowing the fire and for other purposes. The instrument consists of a little tongue made of steel, which is made to vibrate in a little plate of brass. It goes from one side to the other, and if there is fair play the sound is conveniently strong, just as strong as it can be made by the lungs. But the moment this instrument is left on board, this little steel tongue becomes rusted, and the brass plates become covered. Besides that, we all know that a pair of bellows may very easily become "holey," and what are you going to do then? We have them of rubber, and we have them of leather; and I have always heard complaint made of these same bellows whenever used on board of a ship. If I am not mistaken, the greatest number of these complaints come from Great Britain. At least, I remember that quite a good many examples were published in the "Nautical Magazine." Of course, the "Nautical Magazine" is not an authority, but I am simply stating that the experience of Germany has confirmed this statement in such a degree that we thought it was necessary to come back to the most simple definition, and to state that we want an efficient fog-horn on board. We see that there is great difficulty in the way, and that this horn should be described so that the sound to be produced should be of sufficient strength. But it is very difficult to do that. We have no unit and no standard for that purpose. Therefore, we thought it would be better to leave it as it is, and say "an efficient fog-horn;" for by an efficient fog-horn could only be meant such a fog-horn as could be blown by a man. That is to say, that it would not be an efficient fog-horn if on board a vessel there was not a man understanding fully how to blow this instrument.

Captain Van Steyn (the Netherlands).—Mr. President, I found that this Article precludes all other means but steam from being used for a steam-whistle, while at the same time the sound may not be intercepted by any obstruction. A serious drawback is the condensation of the steam, which generally renders the apparatus unfit for use during a few seconds, and it is preferable that compressed air should be applied instead of steam. Arrangements for the construction of compressed air might easily be made on board of steam-ships.

So I suggest that the beginning of this Article 12 should be altered to read, "A steam-ship shall be provided with a steam-whistle or other efficient sound-signal, sounded by steam or compressed air," &c.

We find that on the steam-ship under steam it must be sounded at intervals of not more than two minutes. Now, with the great speed of vessels this two minutes is rather too long. So I propose to read it, "at intervals of not more than one minute, a prolonged blast of six seconds."

We propose that a sailing-ship under way shall make with her fog-horn at intervals of not more than one minute, instead of two minutes, when on the starboard tack one blast, when on the port tack two blasts in succession, if possible of six seconds' duration. In subsection (*c*) we would change the words "two minutes" to "one minute."

Mr. Hall (Great Britain).—Mr. President, I think it is a valuable suggestion which the gallant Delegate from the Netherlands has made to consider whether we should reduce the interval of time within which the signal should be given. I should heartily support a proposition to discuss the question.

Captain Malmberg (Sweden).—Mr. President, the beginning of this Article provides that a steam-ship shall be provided with a steam-whistle or other efficient steam sound-signal so placed that the sound may not be intercepted by any obstructions. I am of the opinion that steam-ships should not be allowed to use "sirens" for sounding fog-signals in narrow waters and in close proximity to the coast, for the reason that they might be mistaken for signals made by light-houses or light-ships. Such mistakes have frequently been made.

Captain Mensing (Germany).—Mr. President, I would like to ask a question of the gallant Delegate from the Netherlands, whether he is aware of the fact or whether he has made any experiments, or noted any experiments which have been made, showing how long it will take the tympanum to become insensible to any sound after such a powerful fog-signal has been blown very near it. I think that it is all very well to have signals for these men who are watching for them; but at the same time, according to my belief, it would be a most dangerous practice; because if a man has to hear for six seconds—as I believe has been proposed here—such a powerful signal as a steam "siren" on board one of our iron-clads, I believe that he would be as good as deaf for the next twenty seconds, and that only gradually his hearing would be restored. That at least has been my experience. Therefore I think it will be much better to put even a lower limit to the signal, and forbid that steam-whistles be used. The best means of safety to the people on board is to thoroughly understand the signals which are made.

Captain Van Steyn (the Netherlands).—Mr. President, in our country some experiments have been made, but I did not mention them because I am chosen as one of the members of the Committee on Sound-signals, and I did not want to waste the time of the Conference on this subject.

The President.—Article 13 is now before the Conference.

Dr. Sieveking (Germany).—Mr. President, the German Delegation intends to propose an amendment to this Article. I think there can be no doubt but that fogs, mists, and snow are the greatest dangers which a ship can meet with on the sea, and, therefore, we are very strongly of the impression that, if it should be possible, the Rules of the Road should be made more efficient and more stringent as to how a vessel is to behave in thick weather. Now, this Rule as it stands, "Every ship, whether a sailing ship or steam-ship, shall, in a fog, mist, or falling snow, go at a moderate speed," is not necessary at all. First of all, it is very difficult to say what is moderate speed. Sailors, at any rate, do not know it, for they have different opinions about it. Courts of Law judge of it in very different ways. I will cite Mr. Marsden, who is said to be a very good authority in the matter, and he says that "moderate speed" is a relative term, and cannot be defined so as to apply to all cases. Then, if it is a relative term, and if it is to depend upon the circumstances of a particular case to decide what is to be considered as "moderate speed," I think it is quite clear that the Rule is not good, because it is not clear and positive. Then, on the other hand, the Article as it stands has a very great disadvantage, and that is this: our sailors are led to think by this Article that if they only slacken the speed a little they have done what the law requires.

It is quite true that it is stated in Article 24 of the Rules that nothing contained in these Rules shall exonerate any ship or crew from observing and taking all precautions which may be required by the ordinary practice of seamen. But because there is here given a certain Rule as to the behaviour of a ship during a fog, they are more apt to think that this is the only Rule to be followed. I have, in several cases, learned that sailors, when it was said that their speed had been too great in a fog, said: Well, Article 13 only says that we were to go at a moderate speed. It allows us to go at a moderate speed; and our speed, which generally in clear weather is 18 or 20 knots an hour, was reduced to 16 knots an hour. This may be, of course, a misinterpretation of the Rules, and that is what the Courts of Great Britain have always pronounced it to be. But still, as the Rules are written for common sailors, I think there is much in this matter that is worthy of consideration whether it should not be amended. It has been said by great authorities that vessels ought to go at such a rate of speed only as to allow them to keep their steerage-way. In speaking to nautical men about this matter, they have said to me: Where is the greater danger? If we meet a fog we know that the fog is falling in our way, and perhaps we have got a quarter of a mile or half a mile to go through it; then the atmosphere will be clear again; and then, perhaps, another fog is falling. Now, if we go at a very slow speed we will remain so much longer in the fog, and the danger will be greater than if we go through the fog as fast as we can, particularly if it is in a track where there is scarcely any probability of meeting vessels. In fact, I think it may be said that, in general, the principle of our fast steamers in plying the ocean is that in thick weather they are to go at as fast a speed as they can. That is a principle which certainly is not sanctioned by us, nor ought it be sanctioned by the law; but its practice is followed. If it only is said to go at a moderate speed, they say: A vessel going at the rate of 5 or 6 knots can just as well come into collision and cause the same damage as she would cause if she went at the speed of 18 knots; and that, at any rate, they would run the same risk, if not a greater risk, of being run into by another vessel.

I think it could not be possible for them to get out their anchors and stop their way altogether. I think nautical men would say at once that would be impossible. So we think that this Article, instead of being of any use, only leads to consequences which ought to be avoided. We propose to make the Rules more stringent by striking out this Article altogether. Now, at first that would look as if we intended to dispense with the necessity of taking precautions in a fog. Of course that is not our intention. The result of striking out this Article would be that it would be left to the circumstances of the case and to the Courts to decide whether all the precautions had been taken in a fog which can possibly be taken, either by slackening the speed or by stopping. Then, in order to induce seamen to believe that, even if this Article were left out altogether, they were not at liberty to do what they liked with their vessels, insert a clause in Article 24, or elsewhere, which would specially point out that, in case of a thick fog, every master of a vessel should take all the precautions which could be possibly taken, so as to enable the Courts then to decide, and say that more precautions could have been taken, and more could have been done than has been done, and to make the duties of vessels in a fog or in falling snow as heavy a responsibility as it possibly can be. That is the intention of the amendment which we intend to propose, and which we beg leave to give to the Conference.

Mr. Goodrich (United States).—Mr. President, I am afraid my friend will fall out of the frying-pan into the fire. The Courts have already construed this Rule. While we all know that there is a double Tribunal to pass upon these Rules, viz., the sailors and the Courts, yet after all, the words

"moderate speed" have now a pretty definite meaning. I remember that my friend cited Marsden. In that he will find a reference to the case of the "Europa" and the case of the "Batavier." In the "Europa" case the Court said, substantially, that a steam-ship must be going at such a rate of speed as that, when she sees another vessel in a fog, she can avoid her.

If she cannot do this without going at the rate of 5 miles an hour, then she must go at the rate of 5 miles an hour. I know of one case decided in the American Courts where 5¾ knots an hour was held to be an excessive speed in a fog at the mouth of New York Harbour. Dr. Sieveking, in his experience as a member of the Court of Admiralty, and other gentlemen who are in our own profession, will know that this subject has been very seriously discussed in the Courts. I took the precaution during the summer to have a Circular sent to the ship-masters in order to get their ideas on this question of moderate speed. In reply, I received letters from the ocean flyers, and from small steamers and from sailing-ship masters, and I noticed a curious fact, that every man answered according to the speed of his vessel. A vessel that would make 20 miles an hour thought 16 miles an hour was moderate speed. A vessel whose maximum speed was 16 miles an hour thought 12 miles an hour would be a moderate speed. The man whose maximum speed was 10 miles an hour thought 7 miles was moderate speed.

But I think we have got a construction now which the Courts, and the lawyers, and ship-owners, and ship-captains, and sailors understand, that their duty in a fog is to go at a very low rate of speed, as low as is consistent with steerage-way. Now, as to a sailing-vessel, our Courts have held in one case that a sailing-vessel was at fault in proceeding at 4 knots an hour, although she had her foresail clewed up.

I do not believe, on the whole, that you can make a Rule that will better this Rule. Of course, I am taking into consideration the fact that this Rule has been in existence and is pretty well understood by the sailing men of the world; and if you attempt to change the law, unless you are quite sure of getting something better, you will be very much in the condition which I described in the opening of my remarks as jumping from the frying-pan into the fire.

Mr. Hall (Great Britain).—Mr. President, I might, perhaps, state very briefly what I believe the English law is upon the subject. On this point, as indeed upon nearly all the points, the Courts of Great Britain are much in accord with the Courts of the United States. The principle which has been laid down in our Courts with regard to what a moderate rate of speed is, is that when a vessel is in a fog, a moderate rate of speed means that she is only justified in keeping such an amount of way as will give her the command of her helm. She is entitled to keep steerage-way on, but she is not entitled to go at a faster rate of speed than is necessary for her to keep that steerage-way. That, I remember, was laid down by the Supreme Court of the United States in two cases. These are the same principles which have been laid down by our Higher Courts of Law in Great Britain. I confess myself I should be very sorry to see any change made in this Rule. I should be very sorry to see this Rule obliterated, because, although for a long time there were doubts in the minds of seamen as to what its meaning was, there has been for a long time such a series of decisions, all pointing to the same results, that I think now the Rule is well understood among all seamen, certainly in Great Britain.

Captain Mensing (Germany).—Mr. President, I think if I should describe, in a short way, the process by which we have come to this startling position, it would be better understood. As my distinguished friend has pointed out, we came here with the intention of being in favour of more stringent laws. We knew, at the same time, that this law was one which was not, perhaps, just as any of us would wish, because, in our opinion, it pointed out the wrong man. I do not believe there is any captain afloat who would like to go at full speed in a fog; but ships are built of which the public and the owners and the world expect speed. They expect them to go fast. Now, what are these ships going to do? I would like to hear of any Company that would give such stringent laws as Mr. Goodrich and the eminent Delegate from Great Britain have told us about. If there is any law, or any Company that has given an order to their captains to go at a speed which is just sufficient to keep steerage-way I would like to hear of it. I refer now to some researches which have been going on in Great Britain by the Royal Society of Arts. These men have taken the trouble of having before them a large number of English shipping captains and English firms, giving to them the promise at the same time that they would not publish their names, and asking them to give the results of their experience. So far as I know, the overwhelming number of these ship-owners, masters, and captains have said that ships were going at full speed—that is to say, practically at full speed. It would be very well for us if you could enforce the Rule about going at a speed sufficient to keep steerage-way; but the captain will say: My ship will not steer if she does not go 15 or 16 knots an hour. What are you going to do then? There are, of course, some fogs which are not very dense, and there are others which are so dense you cannot see anything. We thought at one time that ships should go very slow in a dense fog, and then gradually get up and go at a faster speed when the fog would let them. Now, in such a case as this, the captain would come up on the deck and tell his mate: Do you call this a fog? I do not. Then who is to decide about it—the Courts?

I may say right here that I do not know of any case to which this language refers particularly; that is to say, on the high seas, where two steam-ships have been in collision farther away from the land than 50 miles. I do not know of any case; I have been trying to find one, but have not been able to do so. The only case ever known was the case of the steamer "Britannic." Then we thought of establishing a rule that steam-ships should be allowed to go at more than a moderate rate of speed when they were out in the open seas, but to go very slow when they were within the limit of 50 miles. Still there are a great many dangers, and we thought that would not cover everything. For instance, on making the Channel, without having had any observations for quite a number of days, if I slow my ship down to the rate of 4 knots an hour, I do not know where I am. I am swept by the tide to the north or to the south, and I am not sure which way I am sailing. But if I go fast I shall certainly know about my position. Now, I am very grateful to hear how stringent these laws have been made

in Great Britain; but still I believe that I can point out to my friends cases of negligence. I am perfecting and will lay on the table here a list of a number of ships of Great Britain that have been run aground at full speed, and where the Courts have decided that these captains were to blame because the ships were run aground at full speed without using their leads. I do not believe I make any mistake when I say that from twelve to twenty ships every year are lost in that way when the decision of the English Courts has been that they have been run aground at full speed without using their leads. But how is it to be found out? I think we should do very well if we should try to enforce the Rule here, but we are not able to enforce it. We cannot enforce it. To give an order without being sure that it will be enforced and carried out is, I think, a very dangerous thing to do. Dr. Sieveking made the remark that we would propose this amendment, and so far as our Delegation goes we have unanimously adopted it, after mature consideration, and we have thought that it is the best we could do under the circumstances.

Mr. Goodrich (United States).—Mr. President, my friend, the gallant Delegate from Germany, seems to think that my brother Hall and myself have stated the law too strictly. Let me read ten lines in the case of the "Europa," decided by the English Privy Council:—

"This may be laid down as a rule on all occasions, fog or clear, light or dark, that no steamer has a right to navigate at such a rate that it is impossible for her to prevent damage, taking all precaution at the moment she sees danger to be possible; and if she cannot do that without going less than 5 knots an hour, then she is bound to go at less than 5 knots an hour."

In the case of the "Batavier," Judge Lushington, than whom a greater Admiralty Judge never sat on the Bench, said:—

"That whatever rate of speed a steam-ship was going, if going at such a rate of speed as made it dangerous to any craft that she saw or should have seen, she had no right to go at that rate."

The law can be laid down no stronger than that, and that has got into the minds of sailors, Courts, and lawyers, and the "moderate speed" is a definite idea. Of course I know that captains disobey it. I know that every man who crosses the Atlantic knows that they ride through a fog at full speed. Once in a while they do check their speed a little. I remember counting the revolutions of a steam-ship this summer. I think the full speed was 63 revolutions, and I believe at one time that, in going through a dense fog, they did get down to 60 revolutions. But I think it is very unwise to change the Rule the construction of which has been definitely settled, and it seems to me that we had better let well enough alone.

Captain Mensing (Germany).—Mr. President, I would like to say that it is not my intention to question in any way the information I received as to how the law stood in America, but I only want to point out that I was fully aware that it was not obeyed. Mr. Goodrich had the kindness to point out that this was the law in the United States and England. I believe in other countries it is not so. With us it is. But I have seen quoted a decision of another country, which certainly has as good a right to think that their course is right as well as anybody else, where a ship was run down to 63 revolutions, when the full speed was from 68 to 70 revolutions. There is one other thing I want to mention. Mr. Goodrich seems to think that it is not easy to get out of the way of a fast-moving vessel. According to my idea that is not of much significance, because, if I see any vessel, I can get out of the way in just as short a space of time going at full speed as going slow.

The President.—Are there any further amendments to Article 13? The next Article for consideration will be Article 14:—

"*Steering and Sailing Rules.*"

Mr. Hall (Great Britain).—Mr. President, before opening up this branch of the Rules it would be in order to hand in a formal amendment which I have foreshadowed this morning, a definition of steam-vessels, to include vessels propelled by electricity and otherwise. I will make it to read: "A steam-vessel shall include all vessels propelled by machinery."

Mr. Goodrich (United States).—Mr. President, I move we adjourn.

The Conference thereupon adjourned until Tuesday morning, 22nd October, 1889, at 11 o'clock.

Washington, Tuesday, October 22, 1889, 11 *o'clock* A.M.

THE Conference was called to order at 11 o'clock A.M., Rear-Admiral Franklin in the chair.

The President.—Before proceeding with the order of the day, the Chair wishes to announce that Mr. G. de Weckherlin, Minister for the Netherlands, appeared yesterday and took his seat as a Delegate to this Conference.

When the Conference adjourned yesterday, Article 13 of the Rules of the Road was under consideration.

Mr. Goodrich (United States).—Mr. President, before we proceed to the consideration of the Rules, I move the appointment of another Committee, and present the following Resolution:—

"*Resolved,*—That a Committee, to be known as the Committee on Systems and Devices, shall be appointed by the President; and that it shall be the duty of the Committee to examine and report upon any system or device connected with the business of the Conference, of which a written description, illustrated by plans whenever necessary, is furnished; and that only such as are favourably reported by the Committee shall appear before the Conference."

The necessity of having this Committee is this: My colleague on my right announces that a flood of devices and systems is beginning to pour in upon him, and no doubt, as we open the letters upon our tables, we shall find that we are in the same position. If we have a Committee to which all these plans for lights and signals in regard to steering and other matters shall be presented, they can examine and see whether there is sufficient merit in the matter proposed to render it proper to bring it to the attention of the Conference. That is the purpose of this Resolution. It will also relieve the two important Committees already appointed on lights and on sound-signals of a great deal of unnecessary labour.

The Resolution was put to the Conference and unanimously adopted.

The President.—Article 13 is before the Conference.

Mr. Hall (Great Britain).—Mr. President, as we have now come to a different branch of the Rules, and we are about to deal with the Steering and Sailing Rules, I beg leave to give notice of an amendment to or an addition, which we beg to propose to the Conference; and I would state very shortly what our reasons are. The members of the Conference will have observed that in the Steering Rules, of which there are a considerable number, the words "risk of collision," is the motive point; these Rules only applying when "risk of collision" exists. Although we know it is impossible to frame a definition which will include every case in which there is "risk of collision," yet we have thought, upon advice which has been given to us from a very powerful Committee which met to discuss this point, that it would be most desirable, if we could, to do something or to pass something which would call the attention of sailors to the all-important point of watching the bearings of vessels, and of pointing out, especially at night, the only accurate way in which a seaman can judge of the actions of another vessel of which he only has a light in sight. The only really accurate way is by watching carefully the compass-bearings of that vessel; therefore it is that we propose to put in a preliminary paragraph, which will not be an Article under the Rules of the Road, but which will be simply a paragraph for the guidance of seamen, especially in following the subsequent Steering and Sailing Rules, in which the words "risk of collision" exist.

I want to make it clear that we do not endeavour to give an exhaustive definition of the words "risk of collision," because, as has been pointed out by eminent Judges, it is imposeible to do anything of the kind, as it must depend upon the circumstances in each particular case. But we apprehend that certainly we may, at any rate, be doing something to lessen the large number of collisions which undoubtedly do occur, if we can impress upon the minds of officers the all-important point of watching the compass-bearings of vessels which they see at night, or by day. Therefore, we propose to put in at the heading, before Article 14, and after the words "Steering and Sailing Rules," these words: "Preliminary"—"Risk of collision may, for the purposes of these Rules, be deemed to exist if there is not absolute certainty that if the ships keep their respective courses they will pass clear of each other. Such risk can best be ascertained by carefully watching the compass-bearings of an approaching vessel. If the bearing does not appreciably change, such risk should be deemed to exist."
